PREFACE TO THE SUPPLEMENT

THE last complete revision of THE NEW INTERNATIONAL ENCYCLOPÆDIA, when the entire work was reset, began in 1914, and the present SUPPLEMENT covers the ten years following. The war had so dominated the decade that it was hard to maintain the proportions of a really encyclopædic review; yet the historical perspective of the war had certainly changed and it was essential to a general work of reference that detailed accounts of campaigns, battles, diplomatic struggles, revolutions and political and economic efforts at readjustment should no longer be allowed to prevent response to the diversity of public interests. Therefore the special aim has been to treat the war compactly and clearly and it is hoped that a reasonable balance has been maintained. The pages directly devoted to the war and its consequences probably do not exceed in space an octavo volume of average length, although of course the indirect effects of the war ramify incalculably throughout all parts of the text. The war articles have been prepared in the same manner as the text of the ENCYCLOPÆDIA itself, that is by the editorial staff and specialists and not by either alone. That method, indeed, has been followed throughout the present volumes, as it was in the ENCYCLOPÆDIA.

Space is lacking for a classification of contents or for an outline of the plan, but the scope of the work may be inferred from the following list of a few of the larger groups of articles: The three largest departments are biography, prepared by an editorial staff and special contributors; history, by staff writers and members of the faculty of Columbia University; and the industrial, commercial and financial record of countries (their economic movement described statistically and in narrative), written or revised by experts in the Department of Commerce at Washington. Among the other departments may be mentioned: Agriculture, Forestry, Horticulture, and allied subjects, a large group of articles contributed by a dozen specialists; Anthropology and Ethnology; Applied Science, Archæology, Architecture; Astronomy; Botany; Chemistry; Civil, Mechanical, Municipal, and Sanitary Engineering; Education; Electricity; Finance; Geology; Industries and Manufactures, Medicine; Labor Topics; Law; Literature; Mineralogy and Mineral Production; Music; Painting and Sculpture; Philology, Classical and Modern; Philosophy; Psychology; Railways; Social Economics; Zoölogy, etc

In general the plan of the work has been to supplement effectively the text of the ENCYCLOPÆDIA not by carrying forward its minor entries but by so grouping subjects that they could receive well-rounded treatment.

FRANK MOORE COLBY

Editor of the Supplement

FRANK MOORE COLBY

A Partial List of Contributors and Office Editors

- EDWIN WEST ALLEN, PH D,
United States Department of Agriculture.
AGRICULTURE AND ALLIED TOPICS.
- JOHN B. ANDREWS,
Secretary of American Association for
Labor Legislation and Editor of *American Labor Legislation Review*.
LABOR LEGISLATION AND OTHER LABOR TOPICS.
- MOSES NELSON BAKER, PH.D, C.E
Associate Editor of the *Engineering News-Record*.
- SANITARY ENGINEERING; MUNICIPAL GOVERNMENT.
- W. H. BEAL, M. S.,
FERTILIZERS, SOILS.
- MARCUS BENJAMIN, PH.D., ScD., LL.D.,
Editor to the United States National Museum
BIOGRAPHY.
- RUDIGER BILDEN,
ARTICLES IN SOCIAL ECONOMICS AND HISTORY.
- R. H. BLANCHARD,
Associate Professor of Insurance, Columbia University.
INSURANCE AND WORKMEN'S COMPENSATION.
- W. D. BROWN,
Bureau of Foreign and Domestic Commerce, U. S. Department of Commerce.
NORWAY, SWEDEN, NETHERLANDS, AND AFRICAN COLONIES.
- STELLA BRUNT,
OFFICE EDITOR AND CONTRIBUTOR, DEPARTMENT OF SOCIAL ECONOMICS.
- SCOTT M. BUCHANAN,
PHILOSOPHY AND ETHICS.
- EMMETT A. CHAPMAN,
Bureau of Foreign and Domestic Commerce, U. S. Department of Commerce.
STATES OF AUSTRALIA; NEW GUINEA.
- F. A. CHRISTOPH,
Bureau of Foreign and Domestic Commerce, U. S. Department of Commerce.
BRITISH DOMINIONS AND COLONIES.
- ALLEN LEON CHURCHILL,
STATES OF THE UNITED STATES AND BIOGRAPHY.
- PHILIP M. COPP,
Bureau of Foreign and Domestic Commerce, U. S. Department of Commerce.
FRANCE, BELGIUM, SPAIN, ITALY, SWITZERLAND AND PORTUGAL.
- WALTER H. EVANS, PH D.,
BOTANY, DISEASES OF PLANTS.
- LEON FERRARU,
Instructor in Romance Languages, Columbia University.
RUMANIAN LITERATURE.
- COLONEL GUSTAVE JOSEPH FIEBEGGER,
U. S. A. (Retired),
Formerly Professor of Military and Civil Engineering at West Point; author of a military history of the late war and other works.
- WAR IN EUROPE.
- JOHN DRISCOLL FITZ-GERALD, PH D.,
Member of the Hispanic Society of America; corresponding member of the Spanish Royal Academy of History of Madrid; Professor of Spanish, University of Illinois.
- SPANISH LITERATURE.
- JOHN LAWRENCE GERIG, PH.D.,
Associate Professor of Celtic, Executive Officer, Department of Romance Languages, Columbia University.
- MODERN PHILOLOGY.
- BENJAMIN GINZBURG, M.A.,
PSYCHOLOGY.
- WILLYSTINE GOODSSELL,
Assistant Professor of the History of Education, Teachers College, Columbia University.
- DIVORCE.
- GENERAL A. W. GREELY, PH.D.,
Major-General, United States Army; Commander Greely Polar Expedition.
EXPLORATION; POLAR RESEARCH; ALASKA.
- IRWIN S. GUERNSEY,
Professor of American History, De Witt Clinton High School.
- CONTRIBUTIONS TO WAR IN EUROPE, THE HISTORY OF THE UNITED STATES, AND OTHER HISTORICAL ARTICLES.
- L. M. HACKER,
ASSISTANT EDITOR; CONTRIBUTOR TO AND EDITOR OF HISTORICAL AND GAZETTEER DEPARTMENTS.
- GEORGE HAINES, M. S.,
LIVE STOCK, DAIRYING.
- TALBOT F. HAMLIN,
Member of American Institute of Architects; writer on American Architecture.
ARCHITECTURE.
- F. H. HANKINS,
Professor of Sociology, Smith College.
BIRTH CONTROL.
- ANNE HENRY,
OFFICE EDITOR, BIOGRAPHICAL DEPARTMENT.
- JOSEPH A. HILL,
U. S. Bureau of the Census.
NEGRO MIGRATION.
- MILLO B. HILLEGAS, PH.D.,
Professor of Education, Teachers College, Columbia University; formerly Commissioner of Education of Vermont.
EDUCATION; UNIVERSITIES AND COLLEGES.
- JAMES F. HODGSON,
Bureau of Foreign and Domestic Commerce, U. S. Department of Commerce.

RUSSIA, POLAND AND OTHER SLAVIC COUNTRIES.
W A HOOKER, D V. M.,
ECONOMIC ENTOMOLOGY; VETERINARY SCIENCE.
WILLIAM E. HOOPER,

Former Financial Editor of *Railway Age*.
RAILWAYS

HENRY D. HUBBARD,
Secretary, United States Bureau of
Standards.

PHYSICS

M. JAMES,
Author of *A History of the American
Legion*

AMERICAN LEGION.

WALTER B. KENNEDY,
Professor of Law, Fordham University
Law School.

LAW

CHARLES KNAPP, PH.D.,
Professor of Classical Philology, Barnard
College, Columbia University

CLASSICAL PHILOLOGY

GEORGE KRIEHN, PH.D.,
Extension Lecturer in the History of Art,
Columbia University, Lecturer, Woman's
Art School, Cooper Union.

PAINTING AND SCULPTURE

HECTOR LAZO,
Bureau of Foreign and Domestic Com-
merce, U. S. Department of Commerce.

LATIN-AMERICAN COUNTRIES.

LEONARD J. LEVERY,
Bureau of Foreign and Domestic Com-
merce, U. S. Department of Commerce.

RUSSIA AND ASSOCIATED COUNTRIES; FINLAND;
LATVIA; ESTHONIA.

A. A. LIVINGSTON,
Formerly of the Romance Department of
Columbia University

ITALIAN LITERATURE.

KATHERINE S. LOVELL,
Editorial Proofreader.

AMY LOVEMAN,
Associate Editor of the *Saturday Review*
ENGLISH AND AMERICAN LITERATURE.

ROBERT H. LOWIE, PH.D.,
University of California.

ANTHROPOLOGY AND ETHNOLOGY

COLONEL THATCHER T. P. LUQUER,
Engineers, O.R.C., U. S. A.

ARMIES AND ARMY ORGANIZATION; STRATEGY
AND TACTICS

CLARENCE E. MANNING,
Assistant Professor of Slavonic Lan-
guages, Columbia University.

RUSSIAN LITERATURE; SLAVONIC LITERATURE.

M. J. MEEHAN,
Bureau of Foreign and Domestic Com-
merce, U. S. Department of Commerce.

ISLANDS OF THE WEST INDIES.

THOMAS F. MEEHAN,
Editorial Staff, *America*.

ROMAN CATHOLIC CHURCH.

DOUGLAS MILLER,
Bureau of Foreign and Domestic Com-
merce, U. S. Department of Commerce.

GERMANY.

JAMES R. MOOD,
Bureau of Foreign and Domestic Com-
merce, U. S. Department of Commerce

GREECE, TURKEY AND COUNTRIES OF THE NEAR
EAST; EGYPT, ABYSSINIA, MOROCCO AND
OTHER ARTICLES

PARKER THOMAS MOON,
Assistant Professor of History, Columbia

University; Editor *Political Science
Quarterly*

ARTICLES IN EUROPEAN HISTORY

DAVID HALE NEWLAND,
Formerly Assistant State Geologist of
New York.

GEOLOGY AND MINERALOGY.

VICTOR W. PAGE,
Automotive Editor *Scientific American*,
New York City.

MOTOR VEHICLES AND INTERNAL COMBUSTION
ENGINES

HARRY V. E. PALMBLAD, A.M.,
Professor of Modern Languages, Phillips
University.

SCANDINAVIAN LITERATURE

EDWARD PREBLE, M.D.,

MEDICAL SUBJECTS.

ELIZABETH REID,

BIOGRAPHICAL ARTICLES.

ALFRED REMY, M.A.,
Extension Lecturer, Columbia University,
and formerly Professor of Harmony and
Counterpoint, International Conserva-
tory, New York; Editor of Baker's *Bio-
graphical Dictionary of Musicians*.

MUSIC AND BIOGRAPHIES OF MUSICIANS.

LINDSAY ROGERS,
Associate Professor of Government,
Columbia University; editor, *The Prob-
lems of Reconstruction*.

DIPLOMACY OF THE WAR; LIMITATION OF
ARMAMENTS, ETC.

OLIVER MARTIN SAYLER, M.A.,
Dramatic Critic; author of *Our Ameri-
can Theatre*.

THEATRE.

ALBERT SCHINZ, PH.D.,
Professor of French Literature, Smith
College.

FRENCH LITERATURE.

J. I. SCHULTE,

ARTICLES ON FIELD CROPS.

HERBERT NEWHARD SHENTON,
Department of Sociology, Columbia
University.

PROHIBITION.

MARGARET SHERWOOD,
Instructor, University Extension, Colum-
bia University.

BIOGRAPHICAL ARTICLES.

ROBERT EMMET SHERWOOD,
Motion Picture Editor of *Life*.

MOVING-PICTURES.

WALTER IRVINE SLICHTER,
Head of Department of Electrical Engi-
neering, Columbia University.

TELEPHONY, TELEGRAPHY, RADIO TELEPHONY AND
OTHER ARTICLES IN ELECTRICITY.

EDWARD M. SLOCUM,
Consulting Chemist.

CHEMISTRY.

SYBIL L. SMITH, M. S.,

FOOD AND NUTRITION.

FRANK M. SURFACE,
Bureau of Foreign and Domestic Com-
merce, U. S. Department of Commerce.

FOREIGN COMMERCE AND OTHER STATISTICAL
SECTIONS OF THE ARTICLE UNITED
STATES.

L. SZABO,
Lecturer and Writer on eastern European
subjects.

HUNGARIAN LITERATURE.

CHARLES A. TAYLOR,
Sporting Editor, New York *Herald*.
SPORTS.

DOROTHY J. TEALL,
Editorial Proofreader.

R. P. TEELE, M. S.,
RECLAMATION.

OLIVER SAMUEL TONKS, PH.D.,
Professor of Art, Vassar College.
ARCHÆOLOGY.

AARON L. TREADWELL, PH.D.,
Professor of Biology, Vassar College.
ZOOLOGY.

A. C. TRUE, PH.D.,
AGRICULTURAL EDUCATION, AGRICULTURAL EX-
TENSION.

R. W. TRULLINGER, C. E.,
FARM TRACTOR.

CAPTAIN LEWIS SAYRE VAN DUZER, U.
S. N. (Retired),
Writer on naval and nautical subjects.
NAVAL ARTICLES.

AMELIA VON ENDE,
Critic and newspaper correspondent on
German topics.
GERMAN LITERATURE.

HERBERT TREADWELL WADE,
Late Captain, Ordnance Department,
U. S. Army; author of *Scales and
Weighing—Their Industrial Applications
and Everyday Electricity*.

AERONAUTICS, ENGINEERING, MANUFACTURES,
AND TOPICS IN THE APPLIED SCIENCES.

COLONEL JAMES L. WALSH, O.R.C., U. S. A.,
Chief New York District Ordnance
Office.

ARTILLERY, ORDNANCE, TRENCH WARFARE
MATERIAL, EXPLOSIVES, ETC.

WILLIAM E. WELD,
Associate Professor of Economics, Colum-
bia University.
COÖPERATION; TARIFF; TAXATION; TRUSTS.

ELWOOD A. WELDEN,
Bureau of Foreign and Domestic Com-
merce, U. S. Department of Commerce.
NETHERLANDS; NORWAY; SWEDEN; AND AFRI-
CAN COLONIES.

J. W. WELLINGTON,
HORTICULTURE AND FORESTRY.

JAMES O. WETTERAU,
Instructor in History, New York Uni-
versity.
ARTICLES IN EUROPEAN HISTORY.

H. PARKER WILLIS,
Editor, *Journal of Commerce*.
FINANCE; AGRICULTURAL CREDIT.

THOMAS R. WILSON,
Bureau of Foreign and Domestic Com-
merce, U. S. Department of Commerce.
GREAT BRITAIN AND AFRICAN COLONIES.

EMMA A. WINSLOW, PH.D.,
COST OF LIVING; PRICES; WAGES.

CLARK WISSLER, PH.D.,
American Museum of Natural History.
ANTHROPOLOGY AND ETHNOLOGY.

EDGAR W. WOOLARD,
United States Weather Bureau.
ASTRONOMY; METEOROLOGY; EARTHQUAKES.

MONROE NATHAN WORK,
Professor of Pedagogy and History,
Georgia State Industrial College.
LYNCHINGS.

JULIA C. WRIGHT,
OFFICE EDITOR, COLLEGES AND UNIVERSITIES,
SOCIETIES, RELIGIOUS BODIES, ETC.

THE NEW INTERNATIONAL ENCYCLOPÆDIA

ABBOTT, ROBERT (1851-). An American surgeon, a prolific writer in nearly every field of operative surgery. He was born in New York City and educated at the College of the City of New York (S.B., 1871) and Columbia University (M.D., 1874). Beginning as a pioneer in 1904, he became an authority in the surgical uses of radium and a vigorous opponent of tobacco as a cause of cancer. He has reported over 100 personal cases of smoker's cancer. He has been connected with several of New York's leading hospitals, including St. Luke's, New York Cancer, and New York Post-Graduate, and has held the professorships of surgery in the New York Post-Graduate Medical School and Woman's Medical College.

ABBOT, CHARLES GREELEY (1872-). An American astrophysicist (see VOL. I). Using a spectrophotometer, he succeeded in measuring the heat of the stars to within $\frac{1}{100,000,000}$ °. The experiments began in 1922 and were carried on at the Mt. Wilson Observatory in California with the aid of the great 100-inch reflector. The results are regarded as of the highest interest to scientists.

ABBOTT, EDVILLE G. (1871-). An American orthopaedic surgeon born in Hancock, Me., and educated at Bowdoin College. He was well known through his mechanical so-called Abbott method of treatment of lateral curvature of the spine. In 1913 he demonstrated his method in England and on the Continent. He was professor of orthopaedics at Bowdoin College and has been connected with the Maine General Hospital, the Children's Hospital, etc.

ABBOTT, EDWIN MILTON (1877-). An American lawyer, born at Philadelphia and educated at the Central High School there and the University of Pennsylvania. He was admitted to the bar in 1896 and subsequently distinguished himself in criminal cases. He was chief counsel in the fight of the Philadelphia commuters against the railroads, a member of the Pennsylvania House of Representatives, 1911-12, chairman of the Commission on the Revision of Criminal Laws of the State of Pennsylvania, 1912-15 and 1917-23, and in 1913 minority nominee for judge of the Court of Common Pleas. He was appointed secretary of the American Institute of Criminal Law and Criminology in 1913.

ABBOTT, ELEANOR HALLOWELL (Mrs. FORDYCE COBURN) (1872-). An American writer of fiction. She was born at Cambridge, Mass., and was educated in private schools and at Radcliffe College, where she was a special student. She is a prolific and popular author of light, romantic stories. One of her best-known novels is *Molly Make-Believe*. Besides being a frequent contributor to magazines, especially *The Ladies' Home Journal*, she is author of *The Sick-a-Bed Lady* (1911), *The White Linen Nurse* (1913); *Little Eve Edgarton* (1914), *The Indiscreet Letter* (1915), *Molly Make-Believe* (1916), *The Stingy Receiver* (1917), *Ne'er-do-much* (1918), *Old-Dad* (1919), *Peace on Earth* (1920), *Rainy Week* (1921), and *The Fairy Prince, and Other Stories*, a collection of stories published previously in magazines (1922).

ABBOTT, GRACE (1878-). An American social worker, born at Grand Island, Neb., and educated at the Grand Island College, the University of Nebraska, and the University of Chicago, from which she received the degree of Ph.M. in political science in 1909. Beginning in 1899, Miss Abbott taught for several years in the Grand Island High School and laid a sound foundation for her social work as director of the Immigrants' Protective League (1908-17) and as a resident of Hull House, Chicago (1908-15). She was an extremely efficient director of the Child Labor Division of the Children's Bureau, Washington, D. C. (1917-19), secretary of the Illinois Immigrants' Commission (1920-21), chief of the United States Children's Bureau (1921-), unofficial representative of the United States on the advisory committee of the League of Nations on traffic in women and children (Geneva, 1923), and president of the National Conference of Social Work (1923), the fourth woman to hold this office. Miss Abbott is the author of *The Immigrant and the Community* (1917) and a contributor to various periodicals.

ABBOTT, LAWRENCE FRASER (1859-). An American editor and writer, son of Lyman Abbott. He was born in Brooklyn, N. Y., and educated at Amherst College. In 1891 he became president of the Outlook Company. He was secretary to Theodore Roosevelt during the latter's tour of Europe and Africa, and edited Roosevelt's *African and European Addresses*

(1910). He is the author of an article on Theodore Roosevelt in the *Encyclopædia Britannica* (1911), and of *Impressions of Theodore Roosevelt* (1919).

ABBOTT, LEONARD DALTON (1878-). An American publicist and radical leader, born in Liverpool, England. He came to the United States in 1897. He early plunged into the socialist movement and remained an active worker up to 1905. His interests later turned to libertarian education, in which he at once assumed a commanding place. He was associated in the publication of *The Commonwealth*, *The Free Comrade*, and *The Modern School*, and aided in the founding of the Rand School of Social Science, the Intercollegiate Socialist Society, and the Ferrer School at Stelton, N. J. He is the author of *Ernest Howard Crosby* (1907), and *Francisco Ferrer, His Life, Work, and Martyrdom* (1910), besides many tracts and pamphlets. From 1905 he was one of the editors of *Current Opinion*.

ABBOTT, LYMAN (1835-1922). An American Congregational clergyman and editor (see VOL. I). In 1913 he was expelled from the American Peace Society because military preparedness was vigorously advocated in the *Outlook* which he edited and because he was a member of the Army and Navy League. During the War he was a strong supporter of the government's war policies. His later writings included *Reminiscences* (1915); *The Twentieth Century Crusade* (1918); *What Christianity Means to Me* (1921).

ABBOTT, WILBUR CORTEZ (1868-). American historian and educator (see VOL. I). In 1917 he wrote the *Expansion of Europe*, one of the most important modern American historical works, having as its theme the story of the Commercial Revolution which changed the character of European affairs and inaugurated the modern era. He also wrote *Colonel John Scott of Long Island* (1918). In 1920 Professor Abbott went to Harvard University as professor of history.

ABDERHALDEN, EMIL (1877-). A Swiss chemist and physiologist, born in the Canton of St. Gallen. He was educated at the University of Basle and took his medical degree at Berlin in 1902. After doing research under Prof. Emil Fischer, the distinguished chemist of Berlin, he was made professor of physiology in the University of Halle (1908). Of much original research his discovery of the so-called defensive ferments is best known, together with "Abderhalden's reaction" in connection with their demonstration. His literary activity has been almost without parallel among his contemporaries. In addition to many articles, often in collaboration with others, he has published numerous books. His *Lehrbuch der Physiologischen Chemie*, which first appeared in 1906, has gone through many editions including English translations, the *Handbuch der Biochemischen Arbeitsmethoden* appeared in 1909. Other works of his are *Physiologisches Practikum* (1912); *Abwehrfermente der Thierischen Organismen* (1913; also an English translation); *Synthese der Zellbausteine* (1912; also an English translation); and *Handbuch der Biologischen Arbeitsmethoden* (1920). His crowning work is the immense *Biochemisches Handlexikon*, the publication of which began in 1910. Ten volumes of this encyclopædia had appeared up to 1923.

ABDUL HAMID II (1842-1918). Thirty-fourth sultan of the Ottoman Empire (see VOL. I). After his deposition in 1909 he was held a prisoner by the Young Turk army and was confined first in Saloniki, and later (1915) in Smyrna. He died in a secluded palace on the Asiatic side of the Bosphorus.

ABDUL MEJID EFFENDI (1868-). Former Caliph at Constantinople, born in 1868, the son of former Sultan Abdul Aziz. He was a learned man, a patron of the arts, a painter, and a composer of music. One of his paintings was hung in the Paris Salon of 1914, at the request of Pierre Loti. After the Greek defeat in 1922, the Sultan-Caliph Mohammed VI fled, the office of sultan was abolished, and on Nov. 1, 1922, Abdul Mejid was made Caliph. President Mustapha Kemal Pasha determined that religion should be separated from politics and persuaded the Assembly to accept his views. On Mar. 3, 1924, the caliphate was abolished, and Abdul Mejid and his family were obliged to leave immediately for Switzerland. See CALIPHATE.

ABERCROMBIE, LASCELLES (1861-). An English poet born at Ashton-upon-the-Mersey, Cheshire. He was educated at Malvern and Victoria University, Manchester, and lectured in poetry at the University of Liverpool, contributing at the same time to various magazines. His poetry has been characterized as in the Victorian tradition. His first work, *Interludes and Poems*, appeared in 1908. His other works include *Mary and the Bramble* (1910), *The Sale of St. Thomas* (1911), *Emblems of Love* (1912), *Deborah* (1912), *Speculative Dialogues* (1913), *The Epic* (1914), *Theory of Art* (1922), and *Four Short Plays* (1922), besides *Thomas Hardy, a Critical Study* (1912).

ABERNON, EDGAR VINCENT D', BARON OF ESHER (1857-). A British diplomatist, born at Slinfold, Sussex, England, and educated at Eton. From 1877 to 1882, he was in the Coldstream Guards, in which he became a lieutenant. In 1880 he began to serve in various capacities as British representative in the Near East. In 1883 he was president of the Council of the Ottoman Public Debt, and from 1883 to 1889, financial adviser to the Egyptian Government. Thereafter until 1897 he was governor of the Imperial Ottoman Bank in Constantinople. He became a member of Parliament in 1899. Sir Edgar Vincent was raised to the peerage as Baron d'Abernon in 1914 and during the War was prominent as chairman of the Central Liquor Control Board. He was appointed British Ambassador at Berlin in 1920. He wrote *A Grammar of Modern Greek* (1881) and collaborated in other publications.

ABNORMAL PSYCHOLOGY. See PSYCHOLOGY, ABNORMAL and CONSCIOUSNESS AND THE UNCONSCIOUS.

ABORTION. At one time justifiable or therapeutic abortion was practiced principally in the case of women with narrow pelvises. Owing to the perfection of the aseptic Cæsarean operation, which now has a very low mortality and can be performed successfully by any good surgeon, interruption of pregnancy for simple contraction of the pelvis is no longer considered as wholly justifiable. On the other hand, in the interest of reducing maternal mortality from childbirth and in the salvage of maternal health, many obstetricians advocate and practice interruption of pregnancy in a series of

pathological conditions, such as tuberculosis, heart disease, insanity, etc. This attitude receives some support from the birth control and eugenic movements, but there is an energetic counter-propaganda from religious bodies and from advocates of higher birth rates which tends to reduce cases of artificial termination of pregnancy to a small minimum; in other words, in nearly every case in which abortion is held to be justifiable there are about as many good reasons for non-intervention.

ABRAMS, ALBERT (1863-1924) An American physician (see VOL I). He died at San Francisco in 1924. He was internationally known as the inventor of spondylotherapy and as the inventor of an apparatus with which he claimed he could diagnose a disease by testing a drop of blood. His theories were investigated by the *Scientific American*, which found that no satisfactory conclusion could be reached, since numerous obstacles were placed in the way of the investigators by Dr. Abrams and his followers.

ABRUZZI, PRINCE L. A. (1873-). An Italian vice-admiral and explorer (see VOL I). He was commander-in-chief of the Italian naval forces in the War and showed exceptional ability in operations in the Adriatic. He resigned in 1917 and afterward planned a colonization scheme in Somaliland.

ABYSSINIA. One of the two independent states of Africa on the east coast. The area is variously estimated from 350,000 to over 430,000 square miles. The population is about 11,500,000, a much higher figure than earlier estimates, which ranged from 3,500,000 to 8,000,000. The boundaries, on the side of the Sudan and of the Italian territory, were being delimited in 1924. The leading towns, with their estimated populations, were: Addis-Abeba, the capital (60,000), and Harrar, (40,000).

Industry and Trade. In spite of the richness of its resources, the economic development of the country was retarded by the instability of the social life and the absence of a strong administrative machinery. Agriculture remained primitive and intercourse was hindered by the want of means of communication. Products entering into the export trade were coffee, hides, wax, ivory, civet, and native butter. Deposits of copper, iron, salt, lignite, and potash were known but were as yet little worked. After the War, Abyssinia began to receive the serious attention of foreign capital. A British company was formed in 1918 for the purpose of commercial exploitation; in 1923 were commenced the activities of an Anglo-American company financed largely by American money. A concession of some 60,000 square miles, the northern part of which was crossed by the French Ethiopian railway, was received, and preliminary surveys showed the presence of oil in the Harrar mountains. Estimated figures, the latest available in 1924, showed that commerce was on the increase. Imports and exports for 1913 totaled 49,080,000 francs; for 1917, 56,665,000 francs. The principal trade route was the Ethiopian railway, connecting Jibuti, in French Somaliland, with Addis-Abeba, a distance of 590 miles, which was completed in 1917. Trade was carried on by caravan in the interior and with the Sudan, British East Africa, British Somaliland, Italian Eritrea, and Italian Somaliland. Gambela, on the Baro River, leased to the Sudan government in

1907, was an important trade centre, and a steamer service was maintained between it and Khartum.

History. At the beginning of the European war, Lij Yasu, the young grandson of the Emperor Menelek, was on the throne. He had already embraced Islam, and under Turco-German influence he embarked on a policy of Moslem solidarity, in coöperation with his father, Ras Michael, whom he caused to be crowned king of the Moslem province of Wollo. In April, 1916, he openly acknowledged the overlordship of the Turkish Sultan as Caliph, and about the same time he gave it out that he would take the field against the Allies as soon as the expected German victory was announced. The Allies, particularly the British, offset the German Turkish influence by propaganda of their own, and the Emperor's policy was opposed by most of the native chiefs and by the Christians. Finally the Abuna, or head of the Abyssinian church, publicly proclaimed the dethronement of the Emperor on the ground of his apostasy (Sept. 27, 1916), and his aunt, the princess Zauditu, was crowned empress at Addis-Abeba, Feb. 11, 1917. The direct control, however, was placed in the hands of her cousin, Ras (prince) Tafari, who was made regent and heir to the throne. A desultory civil war followed, lasting more than a year. Lij Yasu, after a slight attempt at resistance, left Harrar in secret for the Danakil country on October 8, but Ras Michael gathered a formidable force, estimated at 80,000, and on October 17 he destroyed the army of the new government after a sharp battle in which 12,000 men were said to have been killed. A few days sufficed the government, however, to rally in great numbers and with superior artillery, and by October 27 it succeeded in cutting off the rear of Michael's army and nearly surrounding it. Forced to surrender or to fight at a disadvantage, he chose the latter. After a desperate encounter and heavy losses on both sides, his army was routed, all his artillery captured, and himself taken prisoner. In this three weeks' campaign the loss of life was placed at 60,000. Of these, 20,000 were Shoan or government troops. No attempt was made to follow up the victory or to subdue Wollo, the disaffected province; and Lij Yasu, taking advantage of this neglect, gathered the remnants of his father's forces and held out in the Wollo country till the latter part of 1917. In December of that year the town of Magdaba, where he had taken refuge, was captured. Lij Yasu escaped, and after futile wanderings among neighboring tribes he returned toward the end of 1920 to the province of Tigre, where in January, 1921, he was captured by government troops. After the War the government of Ras Tafari and the Empress definitely sided with the Allies, and in the summer of 1919, Abyssinian missions of congratulation were despatched to London, Paris, Washington, Rome, and Brussels. On this occasion they received various counsels in respect to measures of social and economic progress and were urged in particular to suppress slavery, which had been stimulated by Menelek's conquests and continued to prevail. Great Britain, primarily, manifested an interest in Abyssinian affairs, and as a result of a British agitation against slavery, the League of Nations Assembly appointed an investigating committee in

September, 1922. This renewed concern over Abyssinia was regarded with suspicion; the agitation, Abyssinians feared, might be seized by interested powers as a pretext for interference in their internal affairs. The result was that to protect their independence, Abyssinia's rulers sent a delegation to Geneva in August, 1923, to apply for League membership. The Regent, at that time, stated justly that Abyssinia's problem was the suppression not of slavery, which was mild in character, but of slave-running, which was caused by the illicit trade in arms. As a result of the violation of the British frontiers by marauding bands of Abyssinians in search of slaves and ivory, Great Britain had gained, in 1919, the cessation of arms importations into Abyssinia, the prohibition applying even to the needs of the central government. It was to supply the general dearth that slaves were being smuggled out across the Red Sea in exchange for munitions and rifles. Abyssinia was admitted to membership in the League of Nations on Sept. 28, 1923. In the winter of 1923-4 an educational commission sent out by the Phelps-Stokes Fund of New York visited Abyssinia and on the conclusion of its investigations reported unofficially that while slavery still persisted, corruption flourished among officials, and commerce was hampered by harsh restrictions, nevertheless there was bright promise of future development, thanks to the country's rich natural resources and the latent abilities of the native population.

ACADEMIC FREEDOM. See UNIVERSITIES AND COLLEGES.

ACADEMY, FRENCH (ACADÉMIE FRANÇAISE). Founded in 1635, this is the oldest and highest of the five academies which make up the Institute of France. Between 1914 and 1924 the following members died: Jules Lemaitre; Albert, Comte de Mun; Charles Jean Melchior, Marquis de Vogüé; Henri Roujon (1914); Alfred Jean François Mézières; Paul Hervieu (1915); Emile Faguet; Marquis Pierre de Ségur; Francis Charnes (1916); Emile Rostand (1918); Etienne Lamy (1919); Emile Boutroux; Jean Aicard (1921); Alfred Capus; Ernest Lavisse; Paul Deschanel; Mgr. Duchesne (1922); de Freycinet; Pierre Loti (L. M. J. Viaud); Alexandre Ribot; Maurice Barrès; Frédéric Masson (1923). The following were elected: Maréchal Joffre (1917); Louis Barthou; Mgr. Baudrillart; René Boylesve-Tardieu; François de Curel; Jules Cambon; Maréchal Foch; Georges Clemenceau (1918); Henri Bordeaux (1919); Robert de Flers; Joseph Bédier; André Chevrillon (1920); René Doumic; Georges Goyau; Pierre de Nolhac (1922); Georges de Porto-Riche; Edouard Estaunié; Maître Henri Robert; Charles Jonnart; and Abbé Bremond (1923). Frédéric Masson, who became permanent secretary in 1919 on the death of Etienne Lamy, was succeeded in 1923 by René Doumic. The Academy was engaged throughout the period on the seventh edition of the great dictionary. The complete list of members at the beginning of 1924 stood as follows: Comte de Haussonville, Paul Bourget, Anatole France (Jacques Anatole Thibault), Gabriel Hanotaux, Henri Lavedan, René Bazin, Maurice Donnay, Jean Richepin, Raymond Poincaré, Eugène Brioux, R. Doumic, Marcel Prévost, Henri de Régnier, H. R. D. Cochin, Maréchal Lyautey,

Pierre de la Gorce, Henri Bergson, Maréchal Joffre, Louis Barthou, Mgr. Baudrillart, René Boylesve-Tardieu, François de Curel, Jules Cambon, Georges Clemenceau, Maréchal Foch, H. Bordeaux, Robert de Flers, Joseph Bédier, André Chevrillon, Pierre de Nolhac, Georges Goyau, Georges de Porto-Riche, Edouard Estaunié, Maître Henri Robert, Charles Jonnart, and Abbé Bremond.

ACADEMY OF ARTS AND LETTERS, AMERICAN. See ARTS AND LETTERS, AMERICAN ACADEMY OF.

ACCIDENTS, INDUSTRIAL. See LABOR LEGISLATION, also WORKMEN'S COMPENSATION.

ACHESON, EDWARD CAMPION (1858-). American bishop of the Protestant Episcopal Church, born at Woolwich, Kent, England, and educated at Wycliffe College in the University of Toronto and at New York University. After service in Canada (1888-9), New York City (1890-92), and Middletown, Conn. (1892-1915), he became suffragan bishop of Connecticut in 1915. He was chaplain in the Canadian army during the rebellion in the Canadian Northwest in 1885 and was Red Cross chaplain and field worker with the American army in France (1918-19).

ACIDOSIS. See DIET.

ACKERMAN, CARL WILLIAM (1890-). An American journalist, born at Richmond, Ind., and educated at the University of Chicago; Earlham College, Richmond, Ind.; and the School of Journalism, Columbia University. He has been correspondent of important news publications, especially of the United Press from the Central Powers (1915-17), of the *Saturday Evening Post* in Mexico, Spain, France, and Switzerland (1917-18), and of the *New York Times* with the Allied armies in Siberia (1918-19). Besides press and magazine articles, he is author of *Germany, the New Republic* (1917), *Mexico's Dilemma* (1918), and *Trailing the Bolsheviks* (1919).

ACOUSTICS. See AUDITION and PHYSICS.

ACTION. While the psychological theories of action and their respective arguments have remained unchanged in the interval since 1914, there was a definite drift in the decade following that year to the explanation by means of reflexes. The school of psychology known as behaviorism (q.v.) has sought to orient psychological research from such mental data as sensations, perceptions, and ideas to the consideration of action responses. From a theoretical point of view, this merely shifts the problem, for it is just as difficult to explain mental life if reflex action is taken as elementary, as it is to pass from passive conscious representation to action. The emphasis upon action as the psychological simple has favored the various developments in applied psychology. It has led to the statistical tabulation of reaction times for different individuals placed either in the same situation or with the same task to do. (See PSYCHOLOGY, APPLIED.) The intelligence tests and the learning and memory curves illustrate the successful empirical use of the concept of action. They measure the rapidity of response among different individuals but do not provide any theoretical insight as to the causes. During the War a section of American psychologists rashly undertook to treat the whole province of human action as a branch of psychology. While this topic belongs rather to moral and political philosophy,

it is significant that the emphasis on action in psychology has accompanied the spread of pragmatism, a philosophy which champions action as against intellectualism. Consult Watson, *Psychology from the Standpoint of a Behaviorist* (1919), and Woodworth, *Psychology, a Study of Mental Life* (1921).

ADAM, PAUL (1862-1920). A French writer (see VOL. I) and *porte-parole* of the symbolist movement. His most celebrated novel, *La Ville Inconnue*, passed through more than a dozen editions. He was an active writer until the year of his death. During the War he engaged in propagandist activity and shortly before his death published *Reims Dcvastée* and *Le Lion d'Arras*, which portray the heroic ruins of Northern France. He died in Paris, Jan. 17, 1920.

ADAMI, JOHN GEORGE (1862-1926). An English pathologist born at Manchester (see VOL. I). During the War he was a colonel in the Canadian Army Medical Corps. He published *War Story of the C.A.M.C.* (1918) and *Medical Contributions to the Study of Evolution* (1919). He moved from Montreal to Liverpool in 1919 and was appointed vice-chancellor of the University of Liverpool.

ADAMS, ANNETTE ABBOTT (1877-). An American lawyer, born at Prattville, Cal. She was educated at the Chico State Normal School, Cal., and the University of California. In 1912 she was admitted to the California bar. She held the office of Assistant United States Attorney in the Northern District of California, 1914-19, and in 1918-20 she was attorney in the same district. In 1920 she was appointed Assistant Attorney General of the United States, an office which she resigned in 1921. She subsequently became chairman of the legislative committee of the California State Federation of Women's Clubs.

ADAMS, CHARLES CHRISTOPHER (1873-). An American zoölogist born at Clinton, Ill., and educated at Illinois Wesleyan University, Harvard University, and the University of Chicago. He was assistant in biology at Illinois Wesleyan (1895-96), assistant entomologist at the Illinois State Laboratory of Natural History (1896-98), Curator of the Museum of the University of Michigan (1903-06), director of the Cincinnati Society of Natural History and curator of the Museum of the University of Cincinnati (1906-07), associate in animal ecology at the University of Illinois (1906-14), assistant professor of forest zoölogy at Syracuse University (1914-16) and professor (1916-), and director of the Roosevelt Wild Life Forest Experiment Station (1919-). Besides numerous papers on animal ecology he published *An Ecological Survey of Isle Royal, Lake Superior*, in collaboration (1909); *Guide to the Study of Animal Ecology* (1915); *An Ecological Study of Forest and Prairie Invertebrates* (1915); and *Variations and Ecological Distribution of the Snails of the Genus Io* (1915).

ADAMS, COMFORT AVERY (1868-). An American electrical engineer, born in Cleveland, Ohio. He graduated in 1890 from the Case School of Applied Science, where from 1886 he also served as an assistant in physics, and for a year was an electrical engineer with the Brush Electric Company. In 1891 he was called to Harvard, where he remained. He became full professor of electrical engineering in 1906, later Lawrence professor of engineering,

and Dean of the Engineering School. During the War he was chairman of the division of engineering of the National Research Council and also served on the Council of National Defense, besides acting as advisor to the Emergency Fleet Corporation. He has given much attention to the study of induction and synchronous motors, to commutations, and to dynamo design schedules. Besides membership in many scientific societies he was president of the American Institute of Electrical Engineers in 1918 and of the American Welding Society in 1919.

ADAMS, ELEANOR N. (?-). An American college president born in Lebanon, Ohio, and educated at the Universities of Cincinnati, Oxford, and Yale. She was a teacher in private schools in Cincinnati before 1911; instructor in English in the University of Cincinnati (1911-12); professor of English (1915-18) at Oxford College for Women (Ohio), of which she was elected president in 1918. She is the author of *Old English Scholarship in England* (1917).

ADAMS, FRANKLIN PIERCE (1881-). American poet and columnist (see VOL. I). As "F. P. A." he was *arbitrator elegantiarum* for an increasing circle during the decade 1914-24. His intellectual honesty and his scorn for all pretense and stupidity, whether in politics, literature, or everyday affairs, were factors in his popularity, though his light verse, strongly reminiscent of C. S. Calverley, his parodies, and his translations from the Latin poets, were among the best of their sorts being written in America. In the New York *Tribune* and after 1922 in the New York *World*, his daily column, "The Conning Tower," attracted contributors whose prose and verse were often quite as witty and perspicacious as his own. From 1914 on, his published volumes were *By and Large* (1914), *Weights and Measures* (1917), *Something Else Again* (1920), and *So There* (1923).

ADAMS, FREDERICK UPHAM (1859-1921). American author and industrial engineer (see VOL. I). In the latter years of his life he became a leading exponent of Frederick W. Taylor's system of scientific management for industry. His publications since 1914 have been *The Romance of Big Business* (1915), *The Open Shop* (1919).

ADAMS, GEORGE BURTON (1851-). American college professor and historian (see VOL. I). Continuing his work in the studies of the English constitution, he made contributions which were acclaimed in both England and America. After 1914 he published *Outline Sketch of the English Constitution* (1918), *The British Empire* (1919), and *The Constitutional History of England* (1921). The last named presented in epitome the fruits of the lifelong researches of the author, the purpose of which was to reject the Stubbs-Freeman explanation of the Teutonic origin of the English constitution and to establish his own theory of feudal or Norman antecedents.

ADAMS, HARRIET CHALMERS (?-). An American explorer and lecturer born at Stockton, Cal. She made extensive journeys through Mexico and into the heart of South America (1903), traveling 40,000 miles and exploring regions never before visited by a white woman. In 1916 she was a war correspondent at the French front. Mrs. Adams has lectured on her

travels and has written of them in the *National Geographical Magazine, Travel*, etc.

ADAMS, HENRY CARTER (1851-1921). An American economist and educator (see VOL. I). His later works included *Description of Industry* (1918) and *American Railway Accounting* (1918).

ADAMS, HERBERT (1856-). An American sculptor (see VOL. I). He received a medal of honor from the Panama-Pacific International Exposition in 1915 and the Watrous Gold Medal from the National Academy of Design (1916). During recent years he was twice president of the National Sculpture Society, and once (1917-20) of the National Academy of Design. His most important recent works are two seated bronze statues, John Marshall and Rufus Ranney, and two historical figures, Stephen Langton and Simon de Montfort, for the courthouse of Cleveland, Ohio, and the graceful group of the McMillan fountain, Washington, D. C.

ADAMS, JAMES TRUSLOW (1878-). American historian. He was born in Brooklyn, N. Y., educated at the Brooklyn Polytechnic Institute and Yale, and from 1900 to 1912 devoted himself to business. During this period he was a partner in a New York Stock Exchange firm and acted as director of several banking, manufacturing, and railroad corporations. He ended his commercial activities in 1912 and from then on devoted himself to literary and historical pursuits, publishing *Memoirs of Old Bridgehampton* (1916) and *History of the Town of Southampton* (1918). His first considerable work was *The Founding of New England* (1921), which won immediate recognition not only for its scholarly worth and stylistic qualities, but also because of its very able and challenging analysis of the Puritan character. As a cultural study of American regionalism, a field too little regarded by the academic scholar, Mr. Adams's work was of the first importance. It received the Pulitzer Prize for the best historical book of the year. In 1923 he continued his chronicle with the volume *Revolutionary New England, 1691-1776*.

ADAMS, JOHN TAYLOR (1862-). An American manufacturer and politician, born at Dubuque, Iowa, and educated at the Dubuque High School. He entered the sash and door manufacturing business in 1881 and later became president of the Carr, Ryder and Adams Company. He entered politics in 1908 as manager of the successful campaign of United States Senator Allison. In 1912 he was manager of the Taft campaign in the Iowa primaries. In the same year he was a member of the Republican National Committee for Iowa and was vice-chairman in 1917. From 1912 to 1916 he was a member of the executive and campaign committees, and in 1921 he became chairman of the National Republican Committee. He was a member of the Iowa State Council of National Defense in 1917.

ADAMS, JOSEPH QUINCY (1881-). An American college professor, born at Greenville, S. C., and educated at Wake Forest College, S. C., the University of Chicago, Cornell University, London, and the University of Berlin. After holding various pedagogical positions, he was appointed professor of English in Cornell University in 1919. Besides contributing to American and European philological journals, he is author of several valuable studies, espe-

cially in the field of the Elizabethan stage, which include: *A Manual of American Literature*, in collaboration (Leipzig, 1909), *Shakespearean Playhouses* (Boston, 1917); with Northrup, *A Bibliography of English Philology* (1918); *The Bones of Ben Jonson*, with articles by others (Chapel Hill, N. C., 1919); with Bradley, *An Allusion-Book to Ben Jonson* (1922); and *A Life of William Shakespeare* (1923). He edited Sheridan's *The Rivals* (Boston, 1910) and *The Turke* by John Mason. He was associate editor of *Materialen zur Kunde des Aelteren Englischen Dramas* and joint editor of *Cornell Studies in English*.

ADAMS, SAMUEL HOPKINS (1871-). An American author and publicist (see VOL. I). The work he had done so effectively in exposing the quack medicine industry Mr. Adams continued in the field of dishonest newspaper advertising. His column, "The Ad-Visor," in the *New York Tribune*, succeeded remarkably in raising the standards of advertising in the daily press. He wrote *The Clarion* (1914) and *Success* (1921), both studies of modern journalism, and several novels, including *The Unspeakable Peck* (1916), *Our Square and the People in It* (1917), and *Siege* (1924).

ADAMS, WALTER S. (1876-). An American astronomer (see VOL. I). In 1917 he received the gold medal of the Royal Astronomical Society of London and the Draper medal of the National Academy of Sciences in 1918. His many papers were originally contributed to the *Astronomical Journal* and to the *Astrophysical Journal*, but they later appeared under the general title of *Contributions to the Mt. Wilson Observatory*. He is also the author of several memoirs, the most important of which were a series of four papers published in 1916 as *Investigations on Stellar Spectroscopy*.

ADAMSON EIGHT-HOUR LAW. See LABOR ARBITRATION; UNITED STATES, *History*; and STRIKES.

ADAMSON, WILLIAM (1863-). British Labor politician, born at Halbeath, Fife. For many years before his public appearance he worked as a miner. In 1902 he became assistant secretary of the Fife and Kinross Miners' Association and in 1908 its general secretary. He was elected to Parliament for West Fife in 1910, and when the Labor party was reorganized in 1917, he became its chairman. In 1918 he was sworn in as a member of the Privy Council. As leader of the Labor party he was head of the official opposition in the House of Commons in 1919 and took a prominent part in the debates in the coal industry and the trade union discussions of 1919, 1920, and 1921. When on Jan. 22, 1924, Ramsay MacDonald formed his Labor cabinet, Adamson was made Secretary for Scotland.

ADAPTATION. The adjustment of a plant or animal to its environment or surroundings as shown in its structural form or habits. Adaptations are rarely or never perfect, and the elimination of the less well adapted in the struggle for existence has been supposed to be a factor in evolution. See ZOOLOGY.

ADDAMS, JANE (1860-). An American settlement worker (see VOL. I) and a regular contributor to the *New Republic*, *Survey*, *Nation*, etc. Her last work, published in 1916, was *The Long Road of Women's Memory*. She was a delegate to the International Women's

Congress at The Hague (1915) and was elected its president. She was also a delegate to similar congresses held at Zurich (1919) and Vienna (1921). Though an avowed pacifist, Miss Addams illustrated her wealth of common sense in the practical rather than theoretical attitude she took toward the War.

ADE, GEORGE (1866-). An American author and humorist (see Vol. I). His popular *Ade's Fables* and *Nettie* appeared in 1914. He was a member of the Indiana State Council of Defense (1917-18).

ADELPHI COLLEGE. A nonsectarian college of liberal arts for women, in Brooklyn, N. Y., founded in 1896. In 1913 the students numbered 176 in regular college courses and 98 in extension courses, and the faculty comprised 18 persons. In 1923-24 there were about 400 students and 28 faculty members, not including the extension courses and summer school. The library was increased from 15,000 to 19,000 volumes. A campaign for an addition of \$1,000,000 to the endowment was conducted during the academic year 1922-23. The president of the institution is Frank D. Blodgett, LL.D.

ADEN. A peninsula and a British protectorate on the southeastern Arabian coast. Area of the peninsula, 75 square miles; of the protectorate, 9000 square miles. The island of Perim, included in the settlement, has an area of 5000 square miles. Population of Aden and Perim in 1911, 46,165; in 1921, 54,923; of the protectorate in 1921, about 100,000. Aden continued as an important entrepôt and transshipment station for the Red Sea country. Imports for 1911-12 were valued at £2,643,276, for 1919-20 at £6,517,000, and for 1922-23 at £7,761,505; exports for the same years were £2,318,595, £7,124,000, and £6,738,167. A railway was begun in 1915 to extend from Aden to Lahej (25 miles). In 1921 administration was transferred from the India Office to the Colonial Office.

ADLER, FELIX (1851-). A German-American educator born in Germany (see Vol. I). Among his later publications are *The World Crisis and Its Meaning* (1915); *Divorce* (1915); *An Ethical Philosophy of Life* (1918), and *The Punishment of Children* (1920). In 1923 Dr. Adler delivered the Hibbert Lectures at Oxford; in 1924 they were published in a volume entitled *The Reconstruction of the Spiritual Ideal*.

ADLER, HERMAN MORRIS (1876-). An American physician, psychiatrist, and criminologist born in New York City. He graduated from Harvard in 1897 and received his degree of doctor of medicine from Columbia University in 1901. He was appointed State criminologist of Illinois in 1917. After 1917 he was director of the Juvenile Psychopathic Institute and after 1919 professor of criminology at the University of Illinois. He has made psychopathic surveys of Cook County, under the auspices of the Rockefeller Foundation, and of the military prisoners during the War.

ADLER, VICTOR (1852-1918). An Austrian Socialist leader (see Vol. I). He played only a passive part in the War, but with its termination, in 1918, he once more took a prominent place in Austrian politics. With other Social Democrats he advocated Austrian union with the German Reich. For a few days he served as Austrian Foreign Minister, but his collapse

and death, on Nov. 12, 1918, lost for the young and helpless republic the counsel of one of its most astute politicians.

ADLER, WOLFGANG FRIEDRICH (1879-). Austrian politician, born at Vienna. He was educated at the Realgymnasium in Vienna and the University of Zurich and lectured in physics in Zurich, 1907-11. From 1910 to 1911 Dr. Adler edited the Social Democratic daily *Volksrecht*, and for the next five years he was secretary of the Austrian Social Democratic party and editor of *Kampf*. His sympathy for the Socialists during the War and expectation of a rising of the proletariat led him at the breakup of the International (1916) to shoot the Austrian prime minister, Count Stürgkh. He was condemned to death on May 19, 1917. This sentence was commuted to 18 years' imprisonment, and in the chaos of 1918 he was amnestied. In 1919 he was elected to the National Assembly. He was president of the Austrian National Workmen's Council and secretary of the International Labor Association of Socialist Parties. It was due to his initiative that the last mentioned was founded in 1921. His later works include *Die Erneuerung der Internationale* (1918); *Maach's Ueberwindung des Mechanischen Materialismus* (1918); *Ortszeit, Systemzeit, Zonenzeit und das Ausgezeichnete Bezugssystem der Electrodynamik, eine Untersuchung über die Lorentzische und die Einstein'sche Kinematik* (1920).

ADOR, GUSTAVE (1845-). A Swiss statesman, born at Geneva, where he studied law at the academy. He was twice mayor of Cologny and a member of the cantonal parliament almost continuously from 1874 to 1915. After holding other important government offices he was elected president of the Swiss National Council in 1901. In June, 1917, he became federal councillor of the federal executive and head of the department of foreign affairs. He was elected by parliament as president for the year 1919. Later he was chairman of the International Committee of the Red Cross (1921).

ADRENALIN. Whereas in 1914 this drug was considered merely as a strong astringent, by 1924 it had become known as one of the most useful in the pharmacopœia. It is a heart stimulant of great value. It has sometimes reanimated the apparently moribund patient when injected directly into the heart. Its power of constricting the blood vessels also makes it of value in hemorrhages. See SECTIONS, INTERNAL.

ADRIATIC SEA. See Fiume-ADRIATIC CONTROVERSY.

ADSORPTION. See PHYSICAL CHEMISTRY.

ADVANCEMENT OF SCIENCE, AMERICAN ASSOCIATION FOR THE. See SCIENCE, AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF.

ADVENT CHRISTIANS. See ADVENTISTS.

ADVENTISTS. The "Advent Movement" originated about 1840 with William Miller, who became convinced that the coming of Christ in person must be premillennial. It embraced the following churches: The Advent Christian Church, the Seventh Day Adventists, Life and Advent Union, the Church of God, Adventist, and the Churches of God in Christ Jesus. The Seventh-Day Adventists, the largest body of the group, differed from the other branches in that it never set a definite date for the coming of the Lord. Its membership in-

creased throughout the world from 125,844 in 1914 to 208,771 in 1922. In North America the number of members increased from 72,015 in 1914 to 102,797 in 1923, the number of churches rose from 2054 to 2226, and the number of ordained and licensed ministers from 769 to 1069. During the ten years the denomination supported 153 mission fields, and 123 colleges, theological seminaries and intermediate schools. Fifty-one publishing houses and branches issued 3904 separate volumes of literature.

ADVERTISING. As the most sensitive outpost of modern business, advertising underwent a remarkable development during the War and the years succeeding it. Not only did the stimulation of business activity during the six years of war inflation lead to an enormous increase of the expenditure for advertising, but the entry of governments and semi-official agencies into selling campaigns lent a new dignity to the profession.

The British government was the first to use advertising methods to sell its war bonds to the people of Great Britain and the United States. Early in 1915 it became evident that the size of the financial operations made it indispensable to appeal beyond the regular investing class reached through the banks. An expenditure of £100,000 was decided upon for newspaper and poster advertising. It produced extraordinary results. The experiment was repeated on a larger scale in the United States when the Liberty Loans came to be floated in 1917 and 1918. By coördinating publicity, propaganda and paid advertising, the number of investors in government bonds was increased fiftyfold. The Victory Loan was sold to more than 21,000,000 individual bondholders.

The adoption of conscription by the belligerent countries made it unnecessary to employ poster advertising for recruiting. This method was extensively used, however, for the maintenance of civilian morale. The war poster attracted leading artists.

In commercial advertising the perfection of the four-color press made it possible to illustrate the text appeal with pictures of advertised goods in their natural colors. This development has been most prominent in American periodicals. In one national magazine between 50 and 75 pages of advertising are printed in colors. The annual expenditure for advertising in the United States is said to approach \$1,500,000,000, although exact figures are not available. This expenditure reflects a growth of more than 100 per cent since the War. Out of it advertising has built itself up as a professional activity, drawing some of the best brains of the land. The centre of the profession is the advertising agency, which has grown from a mere brokerage office for the purchase of space to a technical bureau which plans campaigns and writes and executes the advertising copy. One of the most interesting developments in this connection is the use of publicity to supplement paid advertising. Free publicity before the War was used chiefly by theatrical press agents, who were successful in creating news "stunts" for their stars. During the War, all the relief and welfare agencies maintained publicity bureaus informing the newspapers of their activities, and this practice was speedily imitated by private industrial organizations. In the latter case it was not al-

ways easy to make out a legitimate news interest, and editors put themselves on guard against printing as news what was obviously private propaganda. Large amounts of such copy do get into the newspapers, however, inasmuch as the line between private interest and public interest is not always easy to draw. Publicity cannot be used to sell merchandise, but it can create a favorable atmosphere, which big corporations regard as invaluable. With the growth of advertising as a profession, special steps have been taken to eliminate as far as possible improper methods. Prominent in this activity are the advertising clubs, which bring together the advertising writers of the United States and England in a common federation. These clubs spread the slogan "Truth in Advertising" and endeavored in other ways to standardize practices.

The attempt to apply the methods of experimental psychology to advertising have been for the most part abandoned. Whatever relation advertising has to psychology is seen to belong rather to the empirical psychology of motives, the psychology that is practiced by interpreters of human nature whether they be historians, philosophers, or novelists. In advertising the recognized principle is to associate a strong sentiment with the prosaic announcement of the goods to sell. The use of this principle is open to many moral objections, and it may become more and more necessary for society to legislate against its too enthusiastic application. But as things stand, it is part of the economic system and the necessary competition for public attention.

A. E. F. See WAR IN EUROPE, *Western Front*.

AÉRONAUTICS. If one were to exclude the actual invention of the heavier-than-air machine for mechanical flight and its early practical development, it might be said without fear of contradiction that the period 1914-24 was the most momentous in the history of aerial navigation. In these years not only was mechanical flight reduced to practice, but it was made a method of transportation which had to be seriously considered, and which, while it had not supplanted existing means of locomotion, showed great promise for the future. The War stimulated the use of aircraft and made possible both experimental and service applications on a larger scale than would have been possible otherwise and led to abnormally rapid progress of the art. (See WAR IN EUROPE, *Aerial Operations*; also BOMBING OF VESSELS BY AIRCRAFT.)

Our consideration will take up first the spherical balloon or aërostat, where naturally there had been but little advance save in the use of better fabrics for the gas container, as the utility of this device was limited. Except for flights, rather of a sporting nature, or to test the air currents, spherical or freely flying balloons had a narrow field of usefulness. Secondly can be considered the dirigible, which had reached a point where it was able to cross the Atlantic Ocean, not to mention its use as a serious engine of war for purposes of demolition when not opposed. Third in order will be discussed the various types of heavier-than-air craft, such as airplanes, seaplanes, and helicopters.

Spherical Balloons. During the War, naturally there was little opportunity for the use of spherical balloons, by the belligerents, and

in the neutral countries, also, little attention was paid to this field of aeronautics. For observation the captive kite or sausage balloon was used, but freely flying balloons had no use on or even behind the battle line. Accordingly activity in this department was not resumed until in 1919, the annual balloon race in the United States again was held. On Oct. 2, 1919, this competition was resumed at St. Louis, with entries from 10 American cities. This competition ordinarily is held annually and serves to select the American competitor and alternates for the annual Gordon Bennett balloon trophy race which is held in the country of the winner of the previous year's competition. This now became an annual event, and limited interest attached to the outcome of the competition, which was to determine the largest distance to be flown by any of the contestants. The national balloon race for 1924 was started April 23, at San Antonio, Tex., and while the winner's distance, 1072 miles, did not break the earlier American record made in 1910, nevertheless it developed interesting competition and was in every way successful.

Gordon Bennett Competition. In 1920 the annual international balloon race for the Gordon Bennett trophy was resumed. The United States was then the trophy holder, so that the start was made from North Birmingham, Ala., on Oct. 23, 1920. Eight large spherical balloons participated, filled with by-product coke gas from the Sloss-Sheffield Steel and Iron Company furnaces. From this time this annual international air competition was held regularly in different countries, but without improving on the record of 1887.6 kilometers, or 1172.9 miles, made by Augustus Post and A. R. Hawley, Oct. 17-19, 1910; this was also the American record for distance for the spherical balloon up to 1924. The Gordon Bennett balloon competition took place annually without any specially significant incidents until 1923, when on September 23, the twelfth competition was started at Solbosch, outside of Brussels. The weather conditions, which included severe gales, heavy rains and electric storms, resulted in destruction or damage to some six balloons and fatal casualties to three pilots and two aids, as well as serious injuries to three pilots and two aids. This competition developed considerable discussion, as the rules, which did not permit of postponement under dangerous weather conditions, were followed to the letter. It was believed that some provision should be made whereby subsequent competitions should not be started when to do so would make the flights extra hazardous.

On June 15, 1924, 17 balloons, representing 7 nations, started in the fourteenth competition for the Gordon Bennett cup, taking off from the great Solbosch plain outside of Brussels, Belgium. Unlike the 1923 competition, the weather conditions were favorable, and after the balloons had been filled they left the ground. The first to rise was the *Belgica*, piloted by Ernest de Muyter of Belgium, three times winner of the cup. There were three balloons from the United States, the *Uncle Sam*, piloted by Capt. H. E. Honeywell, the *Good-year*, piloted by Capt. W. T. Van Orman, and the *S12*, piloted by Major Peck and Lieutenant Grey of the United States Air Service. Conditions of wind and weather were not such as to develop fast traveling, and several of the bal-

loons that were carried to the west were forced to land rather than be driven out over the Atlantic Ocean. The competition was won again by the Belgian balloon *Belgica*, piloted by Lieutenant de Muyter, which achieved a distance of 745 miles, landing in Scotland at Alb's Head, 45 miles east of Edinburgh. Lieutenant de Muyter thus became the permanent possessor of the trophy. Second place was taken by the French balloon, *Ville-de-Bordeaux*, piloted by F. Laport, which crossed the English Channel and landed at Brighton, England, covering 198 miles. The United States balloon, *Uncle Sam*, H. E. Honeywell, pilot, was third, with 180 miles.

Outside of the Gordon Bennett international trophy competition and the national balloon race, several important flights were made, some of which developed unusual experiences due to enforced landings in desolate regions. Thus in 1920 the United States naval spherical balloon *A5598* left the naval air station at Rockaway Point, N. Y., and after a trip of 800 miles descended on December 14 in Ontario. None of the various flights exceeded the record for duration made by H. Kaulen of Germany on Dec. 13-17, 1913, of 87 hours, or that for distance made by the German, Berliner, on Feb. 8-10, 1914, of 3052.7 kilometers (1896.9 miles), while for altitude Suring and Berson on June 30, 1901, reached a height of 10,800 meters (35,424 feet).

The International Aéronautic Federation (F. A. I.) makes a distinction of class for spherical balloons, grouping in the first category those up to 600 cubic meters capacity, in the second category those from 601 to 900 cubic meters, and in the third category from 901 to 1201 cubic meters. Up to 1924 the International Federation's records for duration and distance were, for balloons of the first category, as follows: duration, (France) Gaston Fleury and George Fleury, Aug. 15-16, 1923, 19 hours 43 minutes; distance, (France) George Cormier, July 1, 1922, 804.173 kilometers (499.69 miles).

Dirigibles. Prior to the War dirigible balloons or airships had been developed principally for military purposes. They were classified as rigid, semirigid, and nonrigid, depending on arrangement of the gas bags and the supporting frame. At this time the sole examples of the rigid type were the Zeppelin airships of Germany, which had found a limited application for passenger transportation. Of the last two groups named, the airships of French workers and of the Schütte-Lanz and Parseval types in Germany were, perhaps, the most important, though airships of these types had been built in Great Britain and the United States. The Italians also had a semirigid airship which served to train pilots as well as indicate the possibility of future designs. During the War a number of these semirigid and nonrigid craft were built and used, but without decided military advantages.

The Zeppelin Airships. In the field of the rigid airship, the work of Zeppelin done before the War on a systematic basis looking not only to military applications but also to use in commercial air travel and transportation was significant and had an important bearing. In 1913, 10 Zeppelin airships were in service in Germany, and others were being built for the military or naval service. Of the latter, two of the larger craft were destroyed accidentally in

1913. At the outbreak of the War there were three Zeppelins, each of 15,000 cubic meters capacity (19,619 cubic yards; 530,000 cubic feet) in the German Navy. With manufacturing facilities previously developed, it was possible straightway to proceed with further construction, following essentially the same designs but increasing capacity and motive power and improving equipment of the craft. The greater capacity naturally was required for explosives, incendiary, and other bombs which were dropped in the course of raids on enemy territory.

It was stated that the total number of German Zeppelins by the end of the War was 67, of which 17 were lost in action with the enemy, 34 were accidentally destroyed, and six were captured. This statement shows clearly the usual hazards incidental to the operation of dirigibles and the war dangers to which they were exposed from hostile airplanes. In fact when the French and British air squadrons were well organized and the defense measured up to its full strength, it was impossible to employ the Zeppelins on the western front or even in air raids over Great Britain.

British Dirigibles. Previous to the War the dirigible balloon had aroused little interest in Great Britain, and even in 1915 the British Government decided that they were not worth building, principally on account of the inflammability of the hydrogen gas, which could be readily ignited by an incendiary bullet from an airplane. The British government did build in 1916 a series of nonrigid or semirigid dirigibles or miniature airships, known as "blimps," largely for observation purposes. In 1918, when it was realized that there could be made available helium in quantity, it was decided to build a fleet of rigid airships which would be safe from dangers of explosion or fire. Accordingly, with the experience derived from the War and particularly from a study of captured Zeppelins which had been brought to earth, including the *L33* which had been brought down in England, Sept. 23, 1918, there was designed in England, before the Armistice, a type of airship which, filled with helium gas, not only would be suitable for a transatlantic trip, but which would be able to transport and discharge large amounts of high explosive. Inasmuch as the British had suffered severely from the Zeppelins, they sought to make these craft, eight of which were projected, as efficient as possible. None was completed before the Armistice. The *R34*, put into commission in 1919, made the first transatlantic flight by a dirigible. Unfortunately, this craft ran aground and was destroyed, Jan. 28, 1921, during night flying in Yorkshire. Another of the group, the *R38*, was purchased by the United States government and was preparing for an overseas trip to America when it was wrecked in the air, and almost the entire crew of British and American officers and men perished. The *R36*, on June 10, 1921, had a successful endurance test; it was 30 hours in the air on a trip from Pulham to Land's End and back. The *R80*, the *R34* and the *R38* were completed, or practically completed, by 1920. The *R80* had a volume of 1,250,000 cubic feet and a length of 530 feet, as against a volume of 1,980,000 cubic feet and length of 643 feet for the *R34*, and a volume of 2,720,000 cubic feet and a length of 698 feet for the *R38*. The *R34* scored the first transatlantic flight for a dirigible, leaving East Fortune, near Edinburgh, Scot-

land, at 2 A.M., July 2, 1919 and flying by way of Newfoundland, arrived at Roosevelt Field, Mineola, N. Y., at 9 A.M., July 6, 1919. A return trip was made even more successfully, leaving New York on July 9, and reaching Great Britain on the morning of July 12, a distance of 3200 miles in 75 hours and 3 minutes, or a total flying time for the *R34* of 183 hours and 15 minutes for some 7000 miles on this transatlantic trip. This achievement was notable in that the airship experienced various kinds of weather, including fog, heavy squalls, thunderstorms and head winds, and indicated the possibilities of transatlantic flight by a dirigible on a commercial scale.

The *R38*, also referred to above, was designed and constructed by the British for the United States, being known in the United States Navy records as *ZR2*. This airship was the largest and most powerful of the British dirigibles; it had six Sunbeam Cossack engines, each of 350 horse power, or a total of 2000 horse power, and a maximum speed of 72 miles per hour. It was designed for a cruising range of 5000 miles. The *R38* made a number of flights in England and was destroyed on a trial trip, Aug. 25, 1921, falling into the Humber River and carrying with it some 62 officers and men, both British and American. The Americans were included in the training crew which was to take the airship across the Atlantic for the United States. While there was no definite information as to the reason for the failure, it was believed that certain features of design had been overlooked and that there was lack of strength at certain important points. Once the structure failed, the ignition of the gas by the broken electric wires resulted in a fire.

United States Dirigibles. Before the United States had entered the War several small dirigibles had been secured for the army and when it was decided to participate actively in the conflict a number of nonrigid dirigibles resembling the British "blimps," which had been ordered, became available, the first of which were tested in May, 1917. By 1919, a useful American dirigible had been developed, of which the *C5* was a representative. This nonrigid airship was 192 feet in length, 43 feet wide and 45 feet high, with a capacity of 180,000 cubic feet of gas. It had a cruising speed of 42 miles an hour and in May, 1919, made an attempt to cross the Atlantic by way of Halifax. A distance of 1050 miles was accomplished successfully, but a heavy gale arising, the airship was driven from its moorings and carried out to sea, where it was destroyed.

The United States War and Navy Departments, however, had manifested an interest in still larger dirigibles, as they seemed to possess for the United States a considerable field of usefulness. In addition to the airship ordered from the British and a Zeppelin to be secured under the Treaty of Versailles, the American government put under way the *ZR1*, still another airship of the rigid type, but following the lines of the German Zeppelin *L49*, captured intact in France during the War, and supposed to represent the best efforts of the German designers. See NAVIES OF THE WORLD under *United States*.

United States Airship "ZR1." It was decided to construct this airship and its engines entirely in the United States, using the Philadelphia aircraft plant of the United States navy for the

fabrication and their assembly at the large hangar at Lakehurst, N. J. While the airship was based on the Zeppelin designs, these were not to be followed absolutely, and improvements were to be introduced wherever possible. In fact with the serious disaster attending the *ZR2* which the British government had built for the United States, the plans of the *ZR1*, as the *Shenandoah* was called until after she had been put into commission, were submitted to the most careful scrutiny of experts and engineers connected with aeronautics, as well as technical men outside of aircraft circles. The *ZR1* was designed by Com. Jerome C. Hunsaker of the United States navy and was intended to be used by the navy with the surface fleet. It was 677.49 feet in length and 78.74 feet in diameter, with a height of 93 feet. There were 20 gas cells, or balloonettes, inside the frame and fabric, with a total capacity of 2,115,000 cubic feet of buoyant gas. Surrounding these cells were 19 ring frames between which were lighter rings, making a total of 41 rings.

The hull itself was of the general Zeppelin form of streamline design and was built of longitudinal and transverse girders which were braced and covered by fabric, within which were the gas cells already referred to. The rings, girders, and parts involved approximately some 400,000 pieces of the metal alloy duralumin which were riveted together like bridge work and braced by heavy wire. From the hull were suspended the various cars; the control car was located forward, and five engine cars were hung at intervals near the keel between the control car and the outer structures. In each of these cars was installed a 6-cylinder 300-horse power Packard airship engine which turned the propellers. The forward outer wing and inner wing cars had geared propellers, each 16 feet in diameter, while the inner wing cars had direct drive propellers 12 feet in diameter. The *ZR1* weighed 76,000 pounds without fuel, supplies, or crew, and was able to carry a load of from 30,000 to 50,000 pounds of fuel, supplies, crew, etc., depending on whether helium or hydrogen was used and the degree to which the airship was inflated. A crew of 20 to 25 officers and enlisted men was required.

The *ZR1* was the first airship of Zeppelin type to be filled with helium gas, and in September, 1923, it made a very satisfactory trial flight from the naval air station at Lakehurst, N. J. The first extended flight was on October 1-3 of the same year, when a voyage was made from Lakehurst to St. Louis, Mo., and return, a total distance of some 2200 miles, which was

negotiated in a total elapsed time of flight of 47 hours and 49 minutes, of which the actual time in the air was 45 hours and 11 minutes, with an actual flying time of 42 hours and 11 minutes, including a 4-hour cruise over the city of St. Louis. The average speed was 52 miles per hour, and the highest speed 78 miles per hour. Subsequently, during the autumn of 1923, the *Shenandoah*, as she was christened on October 10, made several trips from Lakehurst, including a flight up the Shenandoah Valley on October 27 and a cruise to New England on November 20.

During the spring of 1924, in addition to the repairs occasioned by her breaking loose from the mooring mast, improvements were made, and five engines instead of six were installed. The engine, formerly located in the after section of the control car was removed, and a new specially constructed long range radio sending and receiving set was installed in its place.

United States Airship "Roma." The United States government in the autumn of 1921 purchased from Italy a large semirigid dirigible named the *Roma*, which with a capacity of 1,200,000 cubic feet and a length of 410 feet was stated to possess a range of action of approximately 3500 miles at 80 miles per hour, and had at cruising speed a range of 8000 miles. This airship was shipped to the United States and assembled at Langley Field near Washington. The six 12-cylinder 400-horse power Ansaldo motors received from Italy were later replaced with Liberty motors, and flights were made with fair success until Feb. 21, 1922, when flying near the army base at Hampton Roads, Va., the craft was forced to earth through the failure of the rudder with its vertical controls. The metal-clad nose of the airship came into contact with high tension electric power wires, and immediately the gas bag was ignited. With the exception of those members who were able to jump, those on board were burned to death. The casualties included 13 officers and 21 non-commissioned officers, privates, and civilians.

United States Airship "ZB-3." The United States navy, after the War, determined to make a thorough test of dirigibles, and in 1921 the Allied Council of Ambassadors in Europe agreed to permit the Zeppelin works in Germany to build for the United States on the reparation account a commercial airship of the *L90* type with a gas capacity of 2,475,000 cubic feet. This permission was essential as in the protocol signed in June, 1919, 30,000 cubic meters (1,059,000 cubic feet) maximum capacity had been made the limit for the largest rigid air-

Showing the details of assembly and the disposition of the various parts of the navy-constructed rigid airship.

ship that Germany was permitted to construct. Airships of this size built after the War had not been found profitable in operation. The Zeppelin airship thus constructed for the United States was notable in representing the design and construction of the most experienced men in Germany. It was the highest development of this special type, which in the future must be built outside of Germany if it is to endure. The *ZR3* was a commercial type, as it was stipulated that even a reparations ship must be used only for commercial purposes. It is 650 feet long, 90.75 feet in diameter, and 101.8 feet high from the floor of the control car to the top of the hull. The cruising speed ranges from 45 to 71 miles an hour, affording a radius of action of some 5000 miles as compared with 4000 miles for the *Shenandoah*. There are five Maybach engines, directly reversing without gears, each of 400-horse power, installed in cars suspended close to the keel. The gas capacity is 2,475,000 cubic feet, and a gross lift of approximately 150,000 pounds is afforded, 60 per cent of it useful load, including passengers, fuel, supplies, etc. The control car includes the passenger cabin, supplied from an adjoining electric kitchen, a radio and engineer's room, and forward, the navigator's cabin. The passenger quarters accommodate 30 with berths similar to those of a sleeping car, and a crew of 30 men is required.

Completed in 1924 and brought to the United States, *ZR3* represented the last and best work of the famous plant of Friedrichshafen, which was to be dismantled after contributing so much to aeronautical science and art. In the meantime the Goodyear Rubber and Tire Company secured the rights of manufacture for North America in the autumn of 1923, and announced that it proposed to develop the lighter-than-air craft on a basis of extended commercial air routes. It was well known that German aeronautical engineers had contemplated the establishment of a two-and-a-half day passenger service across the Atlantic. Surveys were made for a 12-hour service between New York and Chicago, and more ambitious plans, involving transatlantic flight, were seriously discussed.

On Oct. 17, 1922, the United States Army dirigible *O2*, the largest "blimp" or nonrigid dirigible in the American air service at that time, was destroyed by explosion, and members of the crew were injured. The accident occurred at San Antonio, Tex., after a flight from Washington to San Francisco. The United States Army Air Service by 1924 had in commission other nonrigid dirigibles, of which one of the TC type, built by the Goodyear Tire and Rubber Company, was of 200,600 cubic feet capacity and could transport a total useful load of 4107 pounds with a maximum speed of 60 miles per hour. This airship had a cruising speed of 47 miles per hour and a range of action of 830 miles. About this time the United States Navy Bureau of Aeronautics had built a nonrigid airship of the *J1* class of almost the same size of envelope but shorter and fatter, having a capacity of 173,000 cubic feet. The power plant consisted of two 125-horse power engines.

Helium for Airships. In view of many serious accidents caused by the ignition and explosion of the hydrogen in the gas containers of airships, unusual interest attached to the development during the War of a process and plant for

the production on a commercial scale of a substitute for hydrogen, in the form of helium. The gas helium was next lightest to hydrogen, but was not inflammable or susceptible to ignition from an electric spark or incendiary projectile, and at the same time it was most inert. Its production in bulk was accomplished by the United States government at Fort Worth, Tex., using the oil from certain wells in Texas and Oklahoma and separating the helium from the other gases by a complicated refrigerating process. This plant and process was developed so that on Dec. 1, 1921, the United States navy nonrigid airship *C7* was successfully inflated with gas thus produced and made a number of trips, and later the *Shenandoah* was also inflated with the gas. Helium is noninflammable and is nonexplosive, but it has 92 per cent of the lifting power of hydrogen, and accordingly for the same gross lift would require an airship of 10 per cent greater volume. In 1924 the United States was able to produce sufficient helium to fill two such airships as the *Shenandoah* which used the gas successfully on all its trips. For other nations no such supplies were available, or, with the possible exception of Canada, likely to be developed.

Development of the Airplane, 1913-1924. From the time of the first flight by Wilbur and Orville Wright, Dec. 17, 1903, up to the opening of hostilities in August, 1914, there had been a rapid development, with the result that practical machines were available which could fly under conditions of satisfactory balance and control, and over distances sufficiently great to prove their usefulness. At the beginning of the second decade of mechanical flight, an interesting landmark was noted when the original Langley "aerodrome," built in 1903, was shipped with its engine from the Smithsonian Institution in Washington to the Curtiss factory at Hammondsport, N. Y. Here the original machine was reclothed without change of size or shape, and the framing, engine, propellers, wings, rudders, and control just as Langley had left them, were put in proper adjustment. With the single addition of a modern radiator and carburetor to the engine, and the use of floats so that the machine could rise from the water, various successful tests were made with the original construction. The few additions referred to involved about 200 pounds more weight and some considerable extra air resistance to the original machine; nevertheless, with Mr. Curtiss as pilot, on May 28, 1914, the machine rose on an even keel and sailed from the surface of the lake under the control of the aviator.

Thus it was demonstrated clearly that the first airplane provided with an internal combustion engine not only was capable of carrying a passenger in sustained flight but also possessed inherent stability sufficient to take care of itself in bad weather. It will be remembered that Langley's earlier machine was a tandem monoplane, driven by twin propellers and carrying above four great dragonfly wings with a long double tail and a steering rudder placed beneath and behind the centre. The original inventor had made no provision in the way of landing gear or pontoons but had relied on a special launching apparatus which in large measure was responsible for disaster in the original tests where the possibilities of the machine failed of demonstration. When a Curtiss

90-horse power engine with a direct connected tractor screw was mounted on the forward part of the frame of the Langley "aërodrome," in place of the original propeller, there was further demonstration of the soundness of the theory on which the original designs were made. The original machine is now in the National Museum at Washington.

Airplanes in 1914. By 1914 there had been developed four fundamental types of heavier-than-air machines: the tractor land plane and seaplane, the latter fitted with pontoons, and pusher land planes and flying boats. With the exception of the Russian Sikorski plane, which was provided with four engines, all were single engine machines, England and the United States favoring biplanes, and France and Germany monoplanes. Largely as a result of racing contests for which substantial prizes had been offered, the French planes of 1914 were the fastest in the world, and at that time the world speed record stood at 125 miles per hour, made by Prévost at Rheims, Sept. 29, 1913, when he flew a Deperdussin plane with a 100-horse power Gnome engine.

In contrast to the sporting competitions of the French, the Germans had arranged military tests and offered prizes for competitions, where the chief importance was to demonstrate reliability and endurance. Accordingly, at this time the non-stop flight record was held by a German, Boehm, who made it with an Albatross plane with a 100-horse power Mercedes engine at Johannesthal, July 10-11, 1914. The altitude record was also made by a German, Oelrich, who on July 14, 1914, at Leipzig flew a D.F.W. plane with a 100-horse power Mercedes engine to a height of 26,730 feet.

The British airplanes of this time, while faster than those of Germany, and capable of carrying larger loads than the French machines, were notable for their stability and ease of control rather than for speed or power. The United States at this time was considerably behind the Europeans, in regard both to the engines and to the planes themselves. It was the manifest availability of the airplane and airship for military purposes that first won encouragement and support for practical aeronautics from the European governments.

The Stimulus of the War. With the outbreak of hostilities in 1914 it was soon found that the airplane possessed not only all the possibilities claimed for it in the way of observation and as an auxiliary to troops, but also that it was to be developed as a weapon of offense. From carrying a camera, when the province of the plane was merely to observe, there was developed special equipment and armament, and not only different hand weapons, but machine guns, bombs, radio and other signaling equipment were installed. This naturally led to changes in the design of the aircraft with due regard for defense as well as offense. It was early found necessary to sacrifice the speed of the French racing machines to reliability and to increase the speed of the British two-seater airplanes and make them single-seaters.

France at this time had a rather heterogeneous collection of airplanes and nonrigid airships, with many types representing experimental work rather than the attainment of definite standards. The same was true of Great Britain and Italy; the air equipment of both these powers was inferior to that of Germany and showed a variety

of types. On the other hand, Germany entered the War with a standardized fleet of airplanes and a group of Zeppelin airships made up not only of those designed for naval purposes but of those successfully employed in passenger service. The German air service, however, starting with ample and standardized equipment of general utility machines, soon found itself seriously handicapped on this very score and was compelled to develop new machines, not only for observation but for fighting and bombing, as the Allies increased the quality and amount of their air strength, developing such types as experience showed were advantageous and efficient.

By all the combatant nations there were required airplanes of power, strength, speed, capacity, reliability, durability and other essential qualifications as engines of war for tactical employment, and these the designers and manufacturers were forced to turn out as fast as possible on an unprecedented scale. Different types were developed, as for observation, for combat with other aircraft, for carrying and discharging large amounts of explosive, and for other purposes. To these, if the War had lasted longer, would have been added without question the actual transportation of considerable bodies of men. To the production and improvement of aircraft were devoted without reserve the wealth, resources, and scientific and mechanical skill of the combatant nations. For its operation, even under extra-hazardous conditions, the picked youth of the warring powers were trained to a high degree of skill and efficiency, while for improvement of design and mechanism endless experiments based on theory, experience, or inventive genius, were freely undertaken on the largest possible scale. For the production of aircraft vast establishments highly and scientifically organized and operated, were established, and a vast industry arose overnight in each of the Allied countries as well as in the Central Powers, where normally such undertakings would have been of slow growth.

Obviously this development was along purely military lines, and the single-seater combat machine, for example, fast and readily maneuvered, was entirely without commercial value. Likewise the two-seater observation plane of the air services had the power and speed desirable for military use but was highly uneconomical in operation, on a commercial basis. Extraordinary progress in developing large bombing machines also was made, but these for the most part required the use of special landing fields. In general, in all of the War design, manufacturing, and operation, cost and economy figured but slightly, and complicated and delicate equipment often met with short life. All these factors must be realized, for while four years of the War did a vast amount to develop aviation, yet at the same time they imposed handicaps and conditions which after the Armistice had to be considered and met. The production of distinct and separate types of airplanes to function along special lines naturally led to corresponding applications in peace times. Thus the observation or message plane became the mail plane for high speed service, the heavier combat plane became the light passenger or express craft, and the heavier bomber at once suggested the large plane susceptible of carrying a number of passengers or substantial amounts of freight. The reconnaissance and military mapping of the War found its counterpart in the surveying, map-

ping, and panoramic photography which soon after the Armistice became an important and recognized branch of aerial activity, bearing a distinct relation to topographic and other surveys. During the War, naturally, military efficiency was the sole measure of performance, and designs and tests were made with that end in view, but with the close of hostilities came again such trials as would demonstrate speed, capacity, altitude, duration, extent of flight, and similar characteristics susceptible of quantitative standards of performance and test. Aircraft in non-military and commercial service had to be operated on a basis of safety and economy, and a commercial service must pay for itself either directly or indirectly but unmistakably.

Seaplanes. After the first successful trials of the airplane it was realized that by arranging the plane so that it would rest on the surface of the water it would be possible to dispense with the landing field for taking off and returning to the ground. With the light weight of the plane it was feasible either to supply pontoons or to construct a fuselage in the form of a boat or hull. The possibilities of the flying boat straightway appealed to a number of yachtsmen, and just before the War a competition for the Schneider International Cup for Modern Flying was arranged at Monaco, on Apr. 20, 1914. The competition covered a course of 150 nautical miles which the winner negotiated in 15 hours, 13.2 seconds. The hydroplane straightway commanded the attention of naval officers, and it was increased as the War developed, inasmuch as it afforded a convenient means of scouting, particularly with reference to submarines. Accordingly, large and substantial planes were built with a sturdy hull that could ride on a fairly rough sea, and with naval officers and yachtsmen interested in their design, useful boats were soon developed and for a while were more generally used than other aircraft in the United States; long flights were made overseas and following the course of rivers. After the War the international competition for seaplanes was reestablished and the Schneider trophy was won in 1923 by a seaplane representative of the United States navy.

Tendency of Design. Even before the outbreak of the War, designers and manufacturers of airplanes realized that in addition to securing lightness for the plane and adequate power for the engine, considerable was to be accomplished. The first progress made was toward securing greater structural strength, and soon it was realized that other factors than lightness must be considered. After satisfactory devices for controlling the plane had been developed on a practical basis, attempts were made to secure greater aerodynamic efficiency of wings. All-metal construction was developed for airplanes of different types and capacities, as they were found to possess greater strength and were in general more serviceable. In fact, the increased use of metal framing and construction was but one of the indications that all aeroplane construction was an engineering matter where technical study and accurate construction were essential for safety and more powerful and generally more efficient machines. With metal construction came the increased use of metal alloys, which for strength and lightness were found suitable. By 1924 a large number of all-metal planes had been built, and the only obstacle to further progress in the construction of metal aircraft was the high cost.

When the supply of duralumin and aluminium alloys became generally available, they were extensively used in airplanes. Magnesium alloys were found available for parts not subject to stress and it was believed that engine crank cases made from such materials might prove as successful as those from aluminium alloys.

While the United States was inferior in the number of its airplanes in 1924, yet unquestionably it had the fastest fighting equipment in the world; this was strikingly illustrated in its pursuit planes, which undoubtedly surpassed the aircraft of European nations. In the Pulitzer trophy competition held at the St. Louis air meet in 1923, a United States navy Curtiss racer, the *NOR* made a record of 243.67 miles per hour, for the St. Louis closed course, and 266.6 miles per hour for the 3 kilometer distance. Later in the year, on November 4, at Mitchel Field, the speed record was increased to 266.59 miles an hour for 3 kilometers (1.864 miles). Such achievements were entirely the result of research and experimental engineering. With the D12 Curtiss engine, which was used in this plane, there was employed the Curtiss C62 airfoil section, the wing type radiator and the Curtiss-Reed one-piece metal propeller. The full streamline wheel and shock absorber, the cellular wooden wing construction, and other improvements in design, the results of aerodynamical investigations, all contributed to the wonderful performance of this type of airplane. The Curtiss army pursuit plane also had been improved and refined to such an extent that in 1924 it could realize a speed of 180 miles per hour. It was virtually a modification of the army Pulitzer racer of 1922, and was used by Lieutenant Maughan in his dawn-to-dusk flight across the continent, June 23, 1924. It was provided with a D12 engine. The Schneider cup racer of the United States navy which was successful in the seaplane contests in England in 1923 was a modification of the navy Pulitzer racer of 1921.

The Barling Bomber. A heavy capacity airplane, completed in 1923, was the largest in the United States air service and, in fact, the largest in the world. The machine was really a triplane, but the intermediate or mid plane was of narrow chord, and the ailerons were on the top and bottom planes only. Six Liberty motors, each of 400-horse power, formed the power plant, and for operation it required a minimum crew of four men. The original specifications demanded that not more than 5000 pounds of bombs shall be carried at one time, but were a 10,000 pound bomb developed, the Barling could lift and carry it for two hours. The weight of the airplane loaded was in excess of 40,000 pounds, and it had a flying speed of some 90 miles per hour.

Engines. The development of aircraft has gone hand in hand with the improvement of internal combustion engines. The aim has been always to secure greater power, reliability, and economy, and at the same time to reduce the unit weight of the power installation as compared with the horse power developed. The development in this field from 1903 to 1918 is shown by the accompanying table where the average values of the principal airplane engines for each year are given, except that in 1903, when the figures are for the Wright motor and the 1918 figure for horse power, 450 pounds, which is that of the Liberty motor. In this, it

will be noted, a ratio of 1.8 pounds per horse power was achieved.

Year	1903	1910	1914	1915	1916	1917	1918
Horse power	21	54	112	133	185	243	450
Weight (lbs)	152	309	437	512	570	693	825
Lbs. per horse power	12.7	5.7	3.9	3.8	3.1	2.8	1.8

The Liberty engine is worthy of passing comment as a wartime attempt by the United States to produce on a quantity basis a new design in which all the best features of the various engines used in the airplanes of the combatant nations would be incorporated and which could be manufactured immediately in quantity. The design was developed in the United States by a group of skilled motor car engine designers, and by 1918 the engine was in quantity production; an output of 3878 motors was secured in that year. These motors were used not only for American airplanes in the closing months of the War but were supplied to the French, British, and Italian machines. The object of the Liberty engine was to combine high power with lightness, and the 12-cylinder motor was developed, in which the best features of American and European types were combined in a single efficient machine. The cylinders were made of steel inner shells surrounded by pressed steel water jackets. Above the cylinder heads were a cam shaft and valve mechanism with an improved arrangement for automatic lubrication. The cam shaft drive, copied almost entirely from the Hall-Scott motor, followed the type of drive used on the Mercedes, Hispano-Suiza and other successful machines. The included angle between the cylinders was 45° instead of 60° as in other 12-cylinder engines of the time. An improved system of lubrication also was employed and an improved type of water tank especially adapted to the new machine. The bore and stroke of the Liberty engines was 5 x 7 inches.

Notwithstanding that vast numbers of Liberty engines were available after the close of hostilities, there was no tendency on the part of American aviation engineers to remain satisfied with their design. As the engines were used and applied to various airplanes and airships, as well as to motor boats, the type was further improved by the army and navy designers and other engineers so as to increase its reliability and efficiency. While the Liberty engine was a pioneer American airplane power plant, it soon found competitors, and superior types were evolved in the United States. With the development of bombing planes for the military service, which continued after the Armistice, there was involved not merely reliability and endurance for the engines but considerable power to take care of planes that could carry large loads of passengers and freight. In the attempt to secure such high power with reliability, it was the general opinion that a large single engine was preferable to a number of engines, as the multi-engined plane required separate controls and did not secure any greater reliability, as three or more engines were necessary to provide against the failure of one.

Up to 1924, 600 horse power had been the usual limit for ordinary gasoline airplane engines, though some 13 or more had been built, rated in excess of this figure, and had received experimental tests.

It might be said here that even during the War, German engineers did not turn their at-

tention to large power plants, either for their airplanes or airships, as their air bases were situated comparatively near the fields of hostilities for the territory to be invaded, and the long trips which many of the Allied machines had to make were not required in their case.

As distinct from engines of great power for use on bombers, other improved types are developed for speed, pursuit, mail, and various other planes. The Curtiss D12 engine, which was employed with great success in planes participating in the Pulitzer, Schneider, and other competitions in 1922 and 1923, demonstrated its usefulness as an engine for a small high-speed airplane, single-seater, fighter, or scout, such as the Curtiss and Boring pursuit airplanes, or for a two-seated fighter. There was a V-arrangement of the twelve cylinders which were water cooled, and the entire engine weighed 670 pounds dry, requiring 44 pounds of water. This engine gave 400 brake horse power at 200 revolutions per minute. In connection with this engine was employed a wing type of radiator where two sheets of brass, one flat and the other corrugated, were soldered together and fastened to the surface of the near wing. The water flowing from edge to edge of the wing and through the corrugations of the two sheets is cooled in its passage. The wing type design eliminates the resistance of the former core type of radiator which interfered with the attainment of the highest possible speed. In the wing type radiator the flow of water to each section can be controlled by the pilot; this makes it possible to eliminate any section when desired on account of leakage. The Curtiss D12 engine was still further refined and the cylinder diameter and compression ratio increased. Its advantages were widely recognized, and straightway European airplane manufacturers secured machines for use with their planes.

The Wright Model T3 high-compression engine, as a result of United States navy tests in 1924, was claimed to be the lightest engine built for the power secured, weighing as it did but 1.7 pound per horse power developed. It was a 12-cylinder engine which developed 680 horse power at 2000 revolutions per minute, with a fuel consumption of .47 pound per horse power hour on nine-tenths running, and for the entire test that was run an average oil consumption of .0065 pound per horse power hour. The engine weighed, dry, 1155 pounds. It was capable of being used both in pursuit and observation planes and in large bombers and flying boats, its power and economy being available for both classes of service.

By 1922 the specifications in the United States army and navy for airplane engines had become most rigorous, and the Bureau of Aeronautics of the United States navy adopted for all types of aircraft engines a standard for service acceptability tests of 300 hours running at full throttle without failure of such a nature as would force the termination of the flight under service conditions. That this was not an impossible condition was demonstrated by the fact that the Wright model E4 completed such a test and ran a total of 572 hours at full throttle with voluntary stops for adjustments.

The Bureau of Aeronautics in 1923 decided on a startling innovation in abandoning definitely the use of water-cooled engines of less than 300-horse power in naval aircraft construction.

This action was taken as a result of the success of the Lawrence-Wright J1, a 200-horse power air-cooled engine. A new model of this engine, the J3, affording 200 horse power at 1800 revolutions per minute, became standard equipment for certain types of naval aircraft. The development of such air-cooled engines as these was bound to exert a very important effect on future aircraft engineering. Inasmuch as the cooling system of the water-cooled type of airplane engine usually amounted to 25 per cent of the weight of the engine itself, it was realized that the problem was to secure an air-cooled engine of such improved dependability that it would equal the best water-cooled device. Improved devices of turbine super-chargers had been developed which made possible ascents to higher altitudes. The most recent of these machines were better cooled and had greatly reduced head resistance. (See INTERNAL COMBUSTION ENGINES.)

Motorless Flight. After the War considerable attention was paid to airplanes without motors, which were used in soaring flight. These were popularly known as gliders, and so-called gliding contests were held; but this was a misnomer, since the devices were essentially planes or winged contrivances which depended on upward air currents for their power to overcome the force of gravity. A large number of different machines of this general class were developed, and the success obtained by 1924 indicated the possibility of producing inexpensive planes which would require engines with but from 5 to 25-horse power and consequently could be constructed and operated without large outlay. In the second place a future development might be the employment of towing planes or cargo carrying motorless airplanes to be hitched to a strong motored plane, in much the same fashion as a trailer to a motor car.

In 1911 Orville Wright made a soaring flight record at Kittyhawk, N. C., remaining aloft 9 minutes and 45 seconds. He started from a sand dune 75 feet high and rose to 230 feet, hovering over the same spot nearly 9 minutes, a record which stood until Dr. Klemperer, a German scientist, built a soaring plane in which he was able to make a 6-mile flight, remaining in the air 13 minutes and 3 seconds, in 1921. Inasmuch as the terms of the Peace Treaty restricted motor driven flight, students and professors who had been carrying on aviation studies prior to and during the War now devoted themselves to research and experiment in planes without motors. The record of Klemperer did not last any longer than September 6 of the same year, when it was broken by a student at the Hanover Technical University named Martens, who, flying from the Wasserkuppe at the head of the Rhoe Valley in Germany, was able to soar for 15 minutes and 40 seconds in a plane designed by Dr. George H. Madelung, then a professor at Hanover.

On Sept. 13, 1921, an aviator named Harth made a flight of 21 minutes and 37 seconds, being able to alight at a spot only 35 feet below his starting point. About this time competitions were held also in France, though in comparison with the work of German gliders the showing made was not at all good. In the year 1922, however, some notable German contests were held at the Wasserkuppe, where by this time the local air currents were well understood. A record of 3 hours and 6 minutes was

achieved by F. H. Hentzen, while two-passenger gliders were shown, one of which remained aloft for 13 minutes. In November, 1922, a British international contest for gliders was held near Brighton, over the English downs, and was won by Alexis Maneyrol, a French aviator, who remained aloft in a tandem plane for 3 hours and 21 minutes. This form of construction naturally suggested the original aerodrome of Langley, a type of design which had not figured extensively in the development of the motor-driven airplane. In 1923, extensive competitions were held, and on January 29 of that year Maneyrol made a world's glider record of 8 hours and 4 minutes, at Vauville, France. This lasted until May 11, 1924, when Ferdinand Schulz, a German glider pilot, established a new duration record for gliders of 8 hours and 40 minutes in the course of a flight in which he maintained an average altitude of 130 feet.

Light Planes. By 1923 it was realized that there was considerable opportunity for the development of light planes making use of the principle of the soaring plane and combining with it a light powered motor. In Germany in the glider competition of 1924, motor gliders also were included, and for these the engines for single-seaters were limited to 750 cubic centimeters (45.75 cubic inches) piston displacement, or 66 pounds weight; and for two-seaters the limit was 1000 cubic centimeters (61 cubic inches) piston displacement, or 88 pounds weight. The German regulations for the 1924 competition spoke of "gliders with auxiliary motors," and it was interesting to see just what differentiation would be made between such planes and "light planes" for which in the various countries competitions were announced for the season of 1924. In all of these, restrictions as to the size and capacity of the engine employed were most specific. Though somewhat heavier than the light plane referred to, an interesting airplane was developed in Germany, known as the Dietrich-Gohiet monoplane, which at the time was called the "Ford of the air." It was driven by a Haacke two-cylinder opposed type of motor rated at 30 to 35-horse power. This was said to give a power loading of 21 pounds per horse power, with a wing loading of 6.5 pounds per square foot. In the United States also a light plane competition was arranged for 1924.

Helicopter. As early as the time of Leonardo da Vinci, air travel by means of a revolving screw or propeller mounted on a vertical axis had been in the minds of scientific men. No attempt to realize this idea was successful until the twentieth century, when a number of devices were brought out which, if not successful on a practical basis, at least showed promise and indicated progress in this field. In 1919 Michelin of France, patron and promoter of aviation, announced a prize of \$100,000 to be awarded to the person who should produce and demonstrate the first heavier-than-air aircraft that would rise from and land on the ground vertically, or would, for example, rise to the roof of a modern house and then return to its starting point. The chief conditions of the Michelin prize provided for a machine to rise vertically from the ground, to possess the greatest possible speed up to 124 miles an hour, and to land vertically within a radius of 5 meters.

In France a helicopter was devised by Pateras Pescara and constructed by the French technical

section of aviation. Here vertical motion was produced by the rotation of two wings in a horizontal position, and a small propeller was provided. In 1923, in the course of experiments at Issy-les-Moulineaux, near the French capital, Pescara kept his machine in the air for three minutes, traveling above the ground at an average height of one meter, and at the conclusion remained stationary in the air for one minute. Other notable performances of the Pescara helicopter included a straight flight of 200 meters length, another of 460 meters, and a circular flight of 650 meters circumference, with the machine landing in a circle of 10 meters diameter from which it took off. Pescara's machine had an automobile-like body, on which was mounted a shaft turning a number of propellers. At official tests held at Issy-les-Moulineaux during November, 1923, Pescara managed to keep his machine in the air at a height of between 1 and 2 meters for 5 minutes and 44½ seconds, traversing a distance of 300 meters and returning to his starting point.

Other French work of importance was the helicopter of Etienne Oehmichen, which, like that of Pescara, was able to rise freely and make short flights. In 1923, a hovering flight of 5 minutes and 15 seconds was made before representatives of the French air department. In fact it was claimed that this helicopter of Etienne Oehmichen had lifted three persons to a height of 5 meters. The machine also twice rose with the same number of passengers to heights of 3 to 5 meters. The Oehmichen helicopter had to its credit a total of two hours in flight, with one flight of nine minutes. It also had accomplished a horizontal flight of 400 meters. Later he secured the first official record.

In Great Britain also, considerable attention had been devoted to this subject, and Louis Brennan, inventor of the mono-railway, had been engaged in experiments at the Royal Aircraft Establishment at Farnborough since 1918 under government auspices. Brennan also had executed more or less short flights or hops, but up to 1924 had not passed beyond an experimental stage.

In the United States a helicopter was devised by the distinguished Emile Berliner and after his death was improved by his son, Henry Berliner. In 1922 this device was able to rise freely seven feet from the ground and remain motionless and steady; in subsequent experiments it was demonstrated that it was possible to give forward motion to the helicopter from the same source of power that provided the upward lift. The Berliner machine involved three propellers, two for the upward motion and one for the forward motion. This device also had not proceeded beyond an experimental stage. The De Bothezat helicopter was constructed under the direction of the engineering division of the United States Army Air Service and reached a point where in the year 1922 it was able to make free flights and show encouraging prospects.

That the helicopter was becoming a serious factor in aeronautics was shown by the fact that after Apr. 1, 1924, the International Aeronautic Federation recognized officially records made with such machines. The first holder of an official helicopter record was Etienne Oehmichen. This was made on April 17, at Valentigny, France, when a horizontal flight of 525

meters (1772 feet) in a direct line was scored. This record was beaten the following day by Pescara at the Issy-les-Moulineaux aerodrome in a straight line horizontal flight with a distance of 736 meters (2550 feet), made in 4 minutes and 11 seconds, while the machine was over 6 feet above the ground. On May 5 Oehmichen made the first circuit flight accomplished by a direct lift machine, covering a triangular kilometer course in 7 minutes and 40 seconds. This flight, which was made under the control of the technical section of the French Air Service, won for Oehmichen a prize of 90,000 francs offered by the French air department for the first 1-kilometer circuit made by a helicopter.

On Apr. 30, 1924, entries were closed for the international helicopter competition for the British Air Ministry's prize of £50,000 offered in May, 1923. This competition attracted 15 or 20 competitors, including the best examples of this type of construction. To win the prize the helicopter must rise vertically to 2000 feet altitude; hover there for half an hour and descend safely; make a circular flight of 20 miles length at 60 miles per hour; and make a gliding flight from 3000 feet altitude with the engine stopped and land in a small area. These conditions seemed difficult of fulfillment, because at the time the entries closed no free helicopter had ever risen more than 10 feet from the ground, although 150 feet was the record height ascent for a captive helicopter of the Austrian designers, Karman and Petroczy. Furthermore, up to this time no helicopter had ever made a gliding flight with the engine stopped or a landing with precision, and the greatest horizontal speed ever made by a helicopter was about 6 miles per hour, or one-tenth that required in the competition.

The World's Aircraft. In 1924 the four leading military flying nations of the world, in order, were France, Great Britain, Italy, and Germany, while Russia and Japan were considered significant as potential powers with future possibilities in no way to be neglected. Of the 55 nations of the world reporting aircraft, 16 engaged in a deliberate policy of establishing air transport, and in particular France, Great Britain, Italy, and Germany were seeking to cover Europe with connecting lines, and also to extend air transportation into Africa, Asia, and South America. Great Britain, in 1923, after some neglect of air travel, was engaged in laying the foundation for considerable extension of aerial activity, particularly in relation to defense and to connection between the colonies. The British firms were building about 24 different types of military and naval aircraft, and types of troop-carrying planes had been produced, each capable of carrying 25 persons. Such designs could readily be developed for large cargo carrying and passenger planes. At the end of 1923 Great Britain had more naval aircraft in serviceable condition than all the other nations together.

As already stated, the military note was the loudest in Europe, and by the end of 1923 France had become the strongest power aeronautically, with a considerable military strength. In 1922 the French airplane factories had produced 3300 planes for military and civil purposes, which gave France a lead in aerial preparedness that was a source of concern to other nations. While in most countries, subsequent to the

Armistice of 1918, the general tendency had been to use up surplus war material, in France new developments were constantly put under way, and in 1923 there were 29 aircraft factories, two airship plants, and 11 concerns manufacturing airplane engines. These naturally brought many foreign orders to France, and with the large number of tourists from abroad, important air lines were operated.

By the terms of the Treaty of Versailles it was provided that all German aviation should be civilian, and even that was seriously handicapped. At the end of the War the Germans had a well organized and productive aircraft industry, and this was not altogether obliterated by the new conditions, notwithstanding the many transformations which were required. At a meeting of the conference of Ambassadors of the Allies held Apr. 14, 1922, there was adopted a prohibition against the construction of airplanes capable of more than $3\frac{1}{2}$ or 4 hours flight and a range of more than 600 kilometers (372.6 miles). This action led to the removal of the well trained technical assistants to foreign countries and the transfer in large measure of designing, supervising, and manufacturing organizations to cities in other countries, but working on German lines and practice. For example, Dr. Junkers became active in Moscow, the Fokker interests were established at Amsterdam, and other leading designers located at other points outside the Empire. Nevertheless, by 1924 Germany was well covered with airplane routes, some of which were maintained in connection with the services from other nations; the line between Berlin and Amsterdam connected with British airplanes regularly carrying passengers to London. The British machines, however, were built to carry nine passengers, while the German machines operating on such routes carried but four or five. In Italy also commercial and military aviation was being developed, though no extensive air routes were planned. Japan too had acquired a number of planes, while in Russia many important developments were in progress, and German designers were aiding the development of both military machines and commercial planes for land travel.

Commercial Flying. After the close of the War, and the period of readjustment involving the demobilization of the air forces of the various powers and the return to peace conditions, the development of civil flying, up to 1924, was confessedly disappointing, notwithstanding the fact that there were numerous improvements and machines of greater capacity, endurance, reliability, and speed were developed. The after-war conditions were in a large measure responsible for the failure to develop civilian flight and the lack of government support made necessary in most cases by necessity for the strictest economy. Furthermore, the general public failed to recognize that aviation had great possibilities outside of its military application.

The United States had developed its air mail to a greater extent than that of any other nation, so that in addition to other lines, on July 1, 1924, it was able to start a through transcontinental mail service on a permanent and scheduled basis. But it was also true that the passenger and parcels express service maintained by American aviation companies was not on as spectacular or methodical a basis as

in Europe. The first American passenger air line service was inaugurated on Nov. 1, 1920, by the Aëromarine Airways, Inc., to operate a daily schedule between Key West and Havana, a distance of about 100 miles, accomplished in a trifle over one hour. This was a private commercial undertaking without government subsidy or support, yet in 1921 this company, whose fleet had increased from three to five 11-passenger flying boats, established lines from New York City to Atlantic City, and also from New York City to Southampton, L. I., and Newport, R. I. In 1922 with its fleet increased to seven 11-passenger boats and nine 4-passenger flying boats, service was established between Cleveland and Detroit, and from Miami and Palm Beach to the Bahamas. By the end of 1923 the Aëromarine Airways in its regular transportation lines carried over 30,000 passengers more than 1,000,000 miles, with only one serious accident. Here the tendency was to establish a regular service with a maximum reliability and safety without making trips under unfavorable weather conditions or taking any chances, however slight.

In 1923 in the United States individuals and companies operating over fixed bases flew 3,014,611 miles, and passengers carried numbered 80,888, the majority of whom paid their passage, whereas in 1921, of 122,512 passengers reported it was doubtful if the majority paid for their transportation. These fixed base fliers gradually were practising business methods and management, and where new lines were established efforts were made to underwrite and guarantee the undertaking by persons most interested.

For the three years, 1921-23, the Aërial Chamber of Commerce of America compiled statistics of fixed base flying which was carried on by an average of 126 fixed base operators with an average equipment of 600 airplanes, of which probably one-fifth were water planes and four-fifths land planes. Altogether 327,510 separate flights were made in this period and 8,767,893 miles were flown, 278,668 passengers carried, and 442,186 pounds of freight transported.

Important as the military and naval situation was in Great Britain, the development of commercial aircraft was important in view of the insular situation and the amount of business with the Continent. At the end of 1923 it was stated that 45,531 passengers had been carried between England and the Continent by air, and 33,362 of these, or 73 per cent of the total, had traveled in British aircraft. There was a constant increase in traffic and in freight, and during the year 1923 a total of 15,137 passengers and over 800 tons of freight had been carried as compared with 12,359 passengers and 477 tons of freight in 1922. The proportion of passengers carried in British machines in 1923 was 79 per cent as against 77 per cent in 1922. In 1923 the average load carried increased to 1200 pounds, representing four or five passengers, and about 270 pounds of freight, whereas in the previous year it was but 810 pounds, three or four passengers, and about 150 pounds of freight. Up to the end of 1923 merchandise representing total of £3,180,319 had been imported and exported by aircraft, British and foreign combined, and in 1923 alone the total value of freight transported exceeded £750,000 sterling. On one single trip five hundred-weight of silver ingots and one ton of furs

were carried by air to France. In 1923 British aircraft engaging in air transport had a record of 943,000 miles flown, equal to about 38 circuits of the globe, an increase of 226,000 miles over the corresponding figure of 1922. In 1922 the London-Paris route which had been in operation since 1919 had a record of 92.5 per cent of flights completed within time limits fixed in the subsidy scheme, while in 1923 the corresponding figure for all routes reached 91 per cent.

After the War, various British air transport companies had sought to maintain foreign routes with more or less indifferent success and with inadequate subsidies but without the development of a comprehensive air policy by the government. There had been four important air transport companies operating under subsidy, and late in 1923 these were combined through efforts of the British Air Ministry so as to meet Continental competition and to develop the British industry. The organization resulting was known as the Imperial Air Transport Company, and it was decided to maintain the old routes, namely London-Paris-Zurich, London-Brussels-Cologne, Manchester-London-Amsterdam, and Berlin-Southampton-Channel Islands. The government granted to this company, which was British owned, a subsidy of £1,000,000 to be spread over 10 years, and stipulated that all aircraft employed were to be British built, registered in Great Britain, and operated by a British staff, and that further experiment and development was to be carried on. The station at Croydon was to be made the world's largest airport and an electric railway spur was to be built direct to the field.

Hazards of Aviation. Progress toward greater safety in civil flying continued, and in the United States in three years from 1921 there were but 470 civilian aviation accidents involving death to 221 persons and injury to 391. Analyses of these accidents show that but 51 occurred to individual or incorporated operators who, having a fixed base, were financially liable and were properly carrying on regular work, and from these 51 accidents death resulted to 25 persons and injury to 40. The observance of a proper safety code and requisite rules for flying provided by national legislation would have obviated many of the accidents, most of which occurred among the "gypsy" or itinerant fliers. Of the 12 fatalities to regular fliers in 1923, five could be properly recorded as marine casualties, since passengers were swept from an aerial boat by the waves after it had alighted safely. In fixed base flying in the United States it was found that for every accident, 171,919.47 miles were safely flown, for every fatality 350,715.72 miles, and for each injury 219,197,325 miles.

RETURNING TO POINT OF DEPARTURE
WITHOUT FUELING

Duration—(United States) Lts. O. G. Kelly and J. A. Macready, U. S. Army T2, Liberty 400 h.p., at Wilbur Wright Field, Dayton, Ohio, Apr. 16-17, 1923, 36 hr. 4 min 34 sec

Distance—(United States) Lts. O. G. Kelly and J. A. Macready, U. S. Army T2, Liberty 400 h.p., at Wilbur Wright Field, Dayton, Ohio, Apr. 16-17, 1923 4050 km (2516.55 mi)

Altitude—(France) Sadi Lecoq, Nieuport-Delage, Hispano 800 h.p., at Issy-les-Moulineaux, France, Oct. 30, 1923. 11,145 m. (36,555 ft.).

Maximum Speed—(United States) Lt. A. J. Williams, U. S. N., Curtiss R2C1, Curtiss 500 h.p., at Mitchell Field, Mineola, L. I., Nov. 4, 1923. 429.025 km hr. (266.59 mi. hr.)

Speed for 100 km (62.14 mi)—(United States) Lt. A. J. Williams, U. S. N., Curtiss R2C1, Curtiss 500 h.p., at St. Louis, Mo., Oct. 6, 1923. 392.379 km. hr. (243.81 mi. hr.)

200 km. (124.27 mi.)—(United States) Lt. A. J. Williams, U. S. N., Curtiss R2C1, Curtiss 500 h.p., at St. Louis, Mo., Oct. 6, 1923. 392.154 km. hr. (243.67 mi. hr.)

500 km. (310.69 mi.)—(United States) Lt. Alex Pearson, U. S. A., Verville-Sperry R3, Wright 350 h.p., at Wilbur Wright Field, Dayton, Ohio, Mar. 29, 1923 270 km hr. (167.8 mi. hr.)

1000 km. (621.37 mi.)—(United States) Lt. Harold R. Harris, U. S. A., DH4B, at Wilbur Wright Field, Dayton, Ohio, Mar. 29, 1923. 205 km. hr. (127.42 mi. hr.)

1500 km. (932.05 mi.)—(United States) Lt. Harold R. Harris, U. S. A., DH4B, Liberty 400 h.p., at Wilbur Wright Field, Dayton, Ohio, Mar. 29, 1923. 184.03 km hr (114.85 mi. hr.)

2000 km. (1242.74 mi.)—(United States) Lt. Harold R. Harris, U. S. A., DH4B, Liberty 400 h.p., at Wilbur Wright Field, Dayton, Ohio, Apr. 17, 1923. 183.83 km. hr (114.22 mi. hr.)

2500 km. (1553.42 mi.)—(United States) Lts. O. G. Kelly and J. A. Macready, Army T2, Liberty 400 h.p., at Wilbur Wright Field, Dayton, Ohio, Apr. 16-17, 1923 115.60 km hr. (71.83 mi. hr.)

3000 km. (1864.11 mi.)—(United States) Lts. O. G. Kelly and J. A. Macready, Army T2, Liberty 400 h.p., at Wilbur Wright Field, Dayton, Ohio, Apr. 16-17, 1923 115.27 km. hr (71.62 mi. hr.)

4000 km. (2174.79 mi.)—(United States) Lts. O. G. Kelly and J. A. Macready, Army T2, Liberty 400 h.p., at Wilbur Wright Field, Dayton, Ohio, Apr. 16-17, 1923 113.93 km hr. (70.79 mi. hr.)

In 1923 the International Aéronautic Federation (Fédération Aéronautique Internationale—F. A. I.) announced a new category of records for airplanes refueled in flight before returning to point of departure. These records were subject to ratification by the F. A. I. after the regulations covering this new category had been formulated at the 1924 General Conference in Paris. Up to March, 1924, Lieuts. L. H. Smith, and J. R. Richter, U. S. A. A. S., who had developed an effective method of refueling, at Rockwell Field, Santiago, Cal., on Aug. 27 and 28, 1923, flying in a DH4B plane, made a record for duration of 37 hours, 15 minutes and 48.8 seconds, and for a distance of 5300 kilometers or 3,293.26 miles. In the course of this flight speed records for distances from 100 kilometers to 5000 kilometers were made as follows:

AÉRONAUTICS

Distance in kilometers	Distance in miles	Speed km. hr.	Speed mi. hr.
100	62.14	140.96	87.59
200	124.27	142.29	88.41
500	310.69	143.48	89.15
1,000	621.37	144.56	89.92
1,500	932.05	144.53	89.81
2,000	1,242.74	144.01	89.48
2,500	1,553.42	142.78	88.72
3,000	1,863.11	141.17	88.15
3,500	2,174.79	142.17	88.34
4,000	2,485.48	142	88.23
4,500	2,796.16	142.36	88.45
5,000	3,106.85	142.53	88.55

Distance Flights. When Louis Blériot first crossed the English Channel in 1909 in his monoplane the possibilities of long trips over sea were clearly indicated, and naturally transatlantic flight became a goal for aviators which loomed up nearer with the achievements of the military and naval aviators in the War. In May 8, 1919, the United States navy planes NC1, NC3, and NC4, left the naval station at Rockaway, N. Y., for Trepassey Bay, Newfoundland, two of the planes arriving at their desti-

nation the same day, and the *NC4*, which had been forced down near Chatham, Mass., reached Newfoundland a few days later, after a new engine was substituted. The three planes left Trepassay Bay on May 16 for the Azores, the *NC4* reaching Horta, 1250 miles distant, in 15 hours and 13 minutes. The *NC4*, the only airplane in good flying condition, then proceeded to Ponta Delgada, and on May 27 it flew from there to Lisbon, a distance of 810 miles, in 9 hours and 43 minutes; or for the entire trip across the Atlantic of 2472 miles, an actual flying time of 26 hours and 51 minutes. The next stage was to Ferrol, Spain, and the last was to Plymouth, England, where the flight terminated.

The success of the United States navy expedition lent interest to the attempt of Commander Grieve and Maj. Harry Hawker in a British Sopwith biplane, flying from St. Johns to make a non-stop transatlantic flight, but they were forced down 1000 miles from their starting point and rescued by a passing Danish steamer. Engine trouble was responsible for the interruption of the flight. On June 14, 1919, the Vickers Vimy bomber, a bi-motored Rolls-Royce biplane with two 4-bladed propellers, piloted by Capt. John Alcock, who lost his life on December 18 of the same year in a crash in France, and navigated by Lieut. Arthur W. Brown, made a landing at Clifton, Ireland, after a 1960-mile flight in 16 hours and 12 minutes, at an average rate of 120 miles per hour. This trip won the London *Daily Mail* \$50,000 prize for the first non-stop flight across the Atlantic. On Aug. 11, 1919, a Farman Goliath biplane flew from Paris to Morocco with 10 passengers in 16 hours and 20 minutes, a record that was, perhaps, as notable as any at this time and indicated the possibilities of long-distance aviation. Capt. Ross Smith in a Vimy bomber, won a prize of £10,000 by flying from Hounslow aerodrome in England to Port Darwin, Australia, 11,500 miles. This was within the 30 days stipulated, being accomplished in 27 days 20 hours and 20 minutes or from November 12 to December 10. In the United States, Lieut. B. W. Maynard in a *DH4*, equipped with 400-horse power Liberty motor, flew from New York to San Francisco and return, or 5402 miles, Oct. 8 to 30, 1919.

Transcontinental Non-stop Flight. The first non-stop flight across the United States, making a record for distance 2700 miles in 26 hours and 50 minutes, was successfully accomplished May 2-3, 1923, by Lieuts. Oakley G. Kelly and John A. Macready, U. S. A. A. S., in an Army-Fokker T2 plane, with Liberty engine. In the previous year these aviators had flown from San Diego to Indianapolis, where a forced landing was made, and at Dayton, Apr. 17, 1923, had made an endurance record of 36 hours, 5 minutes, and 20 seconds. The 1923 transcontinental trip was made in the same plane as was used for the other record-breaking flights, but the plane was improved from the original construction and increased gasoline capacity given to it.

Dawn-to-Dusk Flight. An equally notable flight across the American continent was made on June 23, 1924, when Lieut. Russell L. Maughan, U. S. A. A. S., in a Curtiss pursuit plane (Type PW8, 1924) with a 400-horse power Curtiss D12 engine and supplementary fuel tanks, accomplished a dawn-to-dusk trip from Mitchel Field, N. Y., to Crissy Field, San Francisco, making the 2700 miles in a total elapsed

time of 21 hours, 44 minutes, and in a total flying time of 17 hours, 52 minutes. Lieutenant Maughan divided his trip into six stages. This flight demonstrated the ease with which pursuit planes of the United States Army Air Service, numbering but 25 in 1924, could cross the continent from coast to coast in time of emergency, traveling at an average flying speed of approximately 150 miles per hour.

Around-the-World Flights of 1924. In 1924 a number of important attempts to fly around the world were organized, and representatives of the United States, Great Britain, and France started on carefully organized trips, meeting with varying degrees of success, but all contributing to the development and knowledge of the conditions of long distance flying. On Mar. 17, 1924, the United States Army Air Service started its flight around the world with an itinerary measuring between 25,000 and 26,000 miles. This flight started at Santa Monica, Cal., and extended north to Seattle and thence along the coast to Alaska, thence to Japan from which it was continued to China, India, and the Mediterranean. Extensive preparations had been made for this trip, and the airplanes and engines employed were all American in design, material, and construction, built by the Douglas Company of Santa Monica. The fuselage was made in three detachable sections of steel tubing and divided into an engine section, a middle section, and a rear section. The wings were of standard box beam and built-up rib construction. The upper wing was made in three panels, while the lower wing was made in two. These wings could be folded so that they required but small storage and shipping space. A vertical fin and a horizontal stabilizer were made of standard I-beam and built-up rib construction, while the elevator and rudder were of steel tubing. The axles were of alloy steel tubing, heat-treated after fabrication. For the struts steel tubes were used, streamlined with wood, and the water landing gear consisted of wooden floats of built-up wood construction; the top covering was of three-ply veneer and the bottom of two-ply mahogany.

These world cruisers were biplanes and were designed to serve interchangeably as land and seaplanes, depending on the landing gear. The cruiser, when fitted as a seaplane, weighed, empty, 5100 pounds, and could carry a load of men, equipment, gasoline, fuel oil, etc., of 2615 pounds, making its gross weight 7715 pounds. As a land plane with the landing gear shown in the accompanying plate it weighed, empty, 4300 pounds. With the same load mentioned it would weigh 6915 pounds, so that it would have faster speed. In either case there would be a gasoline capacity of 450 gallons. As a seaplane there would be a wing loading of 10.9 pounds per square foot, and as a land plane of 9.7 pounds per square foot. As a seaplane the load would amount to 18.3 pounds for each horse power, and as a land plane 16.3 pounds per horse power.

The Liberty engine was of the usual 400-horse power type. The wing span for both the upper and lower wings was 50 feet, while the span of the airplane with the wings folded was 20 feet 2 inches. The height over all was 13 feet 7 inches, and the length over all was 35 feet 6 inches. When rigged as a seaplane the world cruiser could attain a normal altitude of 7000 feet and fly at a normal maximum speed of 100

miles per hour, with a landing speed of 35 miles an hour. With the lighter equipment of a land plane it could climb to 10,000 feet, fly 103 miles an hour, and land at a speed of 53 miles per hour. For the round-the-world flight 15 extra Liberty engines were distributed along the route, and 200 per cent replacements in the airplanes were made available. Where long over-water flights were scheduled, 14 extra sets of pontoons were held in readiness. The first part of the flight was made to Seattle with incidental stops en route, and on April 6, the four world cruisers officially started from Seattle flying to Prince Rupert, B. C. On April 10 they proceeded to Sitka, Alaska, and on April 13 they flew directly to Seward. Three of the ships flying from Seward reached Chignik, a distance of 450 miles, but Major Martin's plane failed to arrive, and the expedition was temporarily checked. Bad weather and other difficulties also delayed the flight in Alaska. On May 10 word was received that Major Martin and Sergeant Harvey had safely reached Port Moller, an isolated point on the Bering Sea shore of the Alaskan Peninsula. They had crashed into a mountain in a fog at 1230 A.M. on April 30, on their way from Chignik to Dutch Harbor. The ship was a total wreck, but the aviators were able to reach safety and were brought back to the United States on May 9.

The remaining three cruisers, under the command of Lieut. Lowell H. Smith, flew on May 9 from Nazan to Chicagoff on the Island of Attu, a distance of 530 miles, which marked the completion of the first of the seven divisions into which the grand journey of 27,000 miles was divided. On June 3 Lieutenant Smith, who with the squadron had successfully reached Japan, was designated permanent commander of the flight, on the personal request of Maj. Frederick L. Martin, who had returned to the United States after the accident to his plane in the Alaskan mountains. On June 26 the American aviators were at Calcutta, where wheels were substituted for floats, motors changed, and new wings fitted. The squadron had accomplished some 12,000 miles, or almost half way around the world. Leaving Calcutta on July 1, they flew across India and on to Constantinople. On July 13, they left Bucharest, and with a stop for luncheon at Budapest, reached Vienna at 3 P.M. Leaving Vienna the following day, they arrived at Paris in time to participate in the observance of the French national holiday commemorating the Fall of the Bastille. London was reached on July 16. The following day Brough was reached, and after repairs departure was made for Kirkwall. On August 2, Lieutenant Nelson made Hornafjord, but Lieutenant Wade was forced down by motor trouble and his plane wrecked.

British World Flight. The British world flight began on March 25 under the command of squadron leader Maj. A. Stuart Maclaren, R.A.F., with flight officer W. N. Plenberlieth as pilot. The airship *Vulture* was selected to make the trip. On April 23 Major Maclaren reached Karachi, India, completing the first of the five divisions into which the British globe circling route was divided. The total distance flown was 4890 miles, and Major Maclaren, by long-distance fast flying, was able to make up his schedule, notwithstanding two weeks lost at Corfu for replacement of engine.

Reaching Calcutta, Major Maclaren proceeded to Akyab in Burma, where he arrived on May

21, but on May 24, he crashed in the harbor of Akyab when he was about to proceed to Rangoon. This accident probably would have led to the abandonment of the flight, but a spare airplane which had been sent to Hakodate, Japan, was forwarded to Akyab by two American destroyers and made it possible for Maclaren on June 25 to resume his flight, the next stage of which took him to Rangoon, Burma. Leaving here on June 28 he flew to Bangkok, Siam, whence on the following day he proceeded to Haiphong in French Indo-China. Hong-Kong was reached on June 30, and on July 3, after a stop at Foochow, Shanghai was made. On July 4, Major Maclaren flew across the Eastern Sea to Kagoshima, Japan, and on July 6, he made Kushimoto after a forced landing at Susami to refuel. He landed in Lake Kasumi near Tokyo on July 7. On July 13 Major Maclaren left Kasumigara and reached Minato. Proceeding by several stages, West Kamchatka was reached on August 1, but leaving here the plane was wrecked on the following day and the flight abandoned, as no more planes were available.

French Expedition. The French Paris-to-Tokyo expedition, which consisted of Lieut. Peltier d'Oisy, pilot, and Sergeant Vesin, mechanic, left Paris on April 24, arriving in Agri, India, on May 3, and flew thence to Calcutta, making the 850 miles in 6½ hours. This gave a flying time from Paris to Calcutta of 51 hours and 55 minutes, and a total elapsed time, for 6300 miles distance, of 12 days. Hanoi, the capital of French Indo-China, was reached on May 13, and a new 400-horse power engine was substituted, notwithstanding the fact that the original engine had served the fliers without any trouble for 900 miles and doubtless would have held out until Japan was reached. On May 18 their departure was made from Hanoi, and 620 miles to Canton, in southern China, was accomplished in 5½ hours, most of the time in heavy rain. Captain d'Oisy unfortunately smashed his plane on May 20 in landing at Shanghai, China, but the Chinese governor presented him with a Breguet plane in which he flew to Peking, a distance of 650 miles. From Peking, Captain d'Oisy proceeded to Mukden in Manchuria, and on the following day he flew from Mukden to Pingyang in northern Korea, and then crossing the Korean Strait on June 8, reached Japan. The flight terminated at Tokyo. It was notable as the first trip of the kind, extending from Paris, France, to Tokyo, Japan, a distance of 11,000 miles.

Air Mail. One of the earliest suggested applications of the airplane was to the transportation of mail and small packages where time was an important consideration. This was attempted spasmodically before the War, and during that conflict airplanes were employed to transmit dispatches and various articles or small freight. In the United States during the War, there was inaugurated, on May 15, 1918, a regular air mail service between Washington and New York, which functioned for a year with a performance of 92.73 per cent, carrying 7,720,840 letters with revenues from the sale of airplane mail stamps amounting to \$159,700 as against a cost of service of \$137,900.06. This air mail was started by the United States army aviators, but on Aug. 10, 1918, it was turned over to the Post Office Department, by which all such activities were subsequently conducted. On May 15, 1919, the Cleveland-Chicago air route was established,

and on July 1 of the same year New York and Cleveland were connected, the combined service making possible a substantial reduction of the time of transmission for letters between these centres, enabling them to catch mail trains, or advancing them over mail-train time. On July 18, 1919, the rate on airplane mail was reduced to \$.02 an ounce, the regular first class rate; from that time, the air mail was on the same basis as other means of transportation. In Europe also a beginning was made in aerial mail service, and during the British railway strike of 1919, mail was carried by airplane. The first regular French aerial postal service was inaugurated, Nov. 10, 1919, when mail was transported to England from Bourget, near Paris, and service was maintained between that place and Hounslow near London. On longer and shorter routes air mail lines were established.

On Sept. 8, 1920, the first transcontinental mail left Mineola Field near New York City, reaching Marina Field near San Francisco on September 11. This was made possible by the establishment of definite routes or stages with depôts at the change points, and while through mail was not carried as a regular thing, the ordinary mail was advanced wherever possible.

In 1923 United States mails were carried under contract between Seattle and Victoria, B. C., on Puget Sound; from New Orleans, La., along the coast by the Gulf Coast Air Line; and in Alaska between Fairbanks and McGrath, where the airplane was given a thorough and successful test in competition with dog sleds for the transportation of local mails.

The transcontinental mail service at first was not a through service but aimed to advance the railway mail over the various stages and thus cut down the actual time of transportation materially. So regular and reliable was this service that in the week ending Aug 25, 1923, tests were made showing the practicability of a direct 28 hour service between the Atlantic and Pacific coasts by relays of mail planes flying both day and night over a distance of 2680 miles. These night flights, which made continuous movement of the mails possible, were made on the specially equipped and lighted airway between Chicago and Cheyenne, and it was shown conclusively that direct service between New York and San Francisco could be maintained as soon as authorized by Congress, which action came in the following year. The experience and developments of the United States postal air service demonstrated that in commercial flying all meteorological obstacles except fog had been overcome.

Under authority provided by Congress in the spring of 1924 the Postoffice Department was empowered to establish a transcontinental mail which would permit direct transportation from the Atlantic to the Pacific Coast. For this service there was established a graded charge ranging from \$.08 to \$.24, the country being divided into zones, as from New York to Chicago, Chicago to Cheyenne, and Cheyenne to San Francisco. The airplanes used in the test flights of 1923 to determine the feasibility of a regular through mail service from coast to coast used night flying for this service along with special planes of new types. The illuminated airways were available for regular mail work, which was begun on July 1, 1924, on a basis indicated in the accompanying plate.

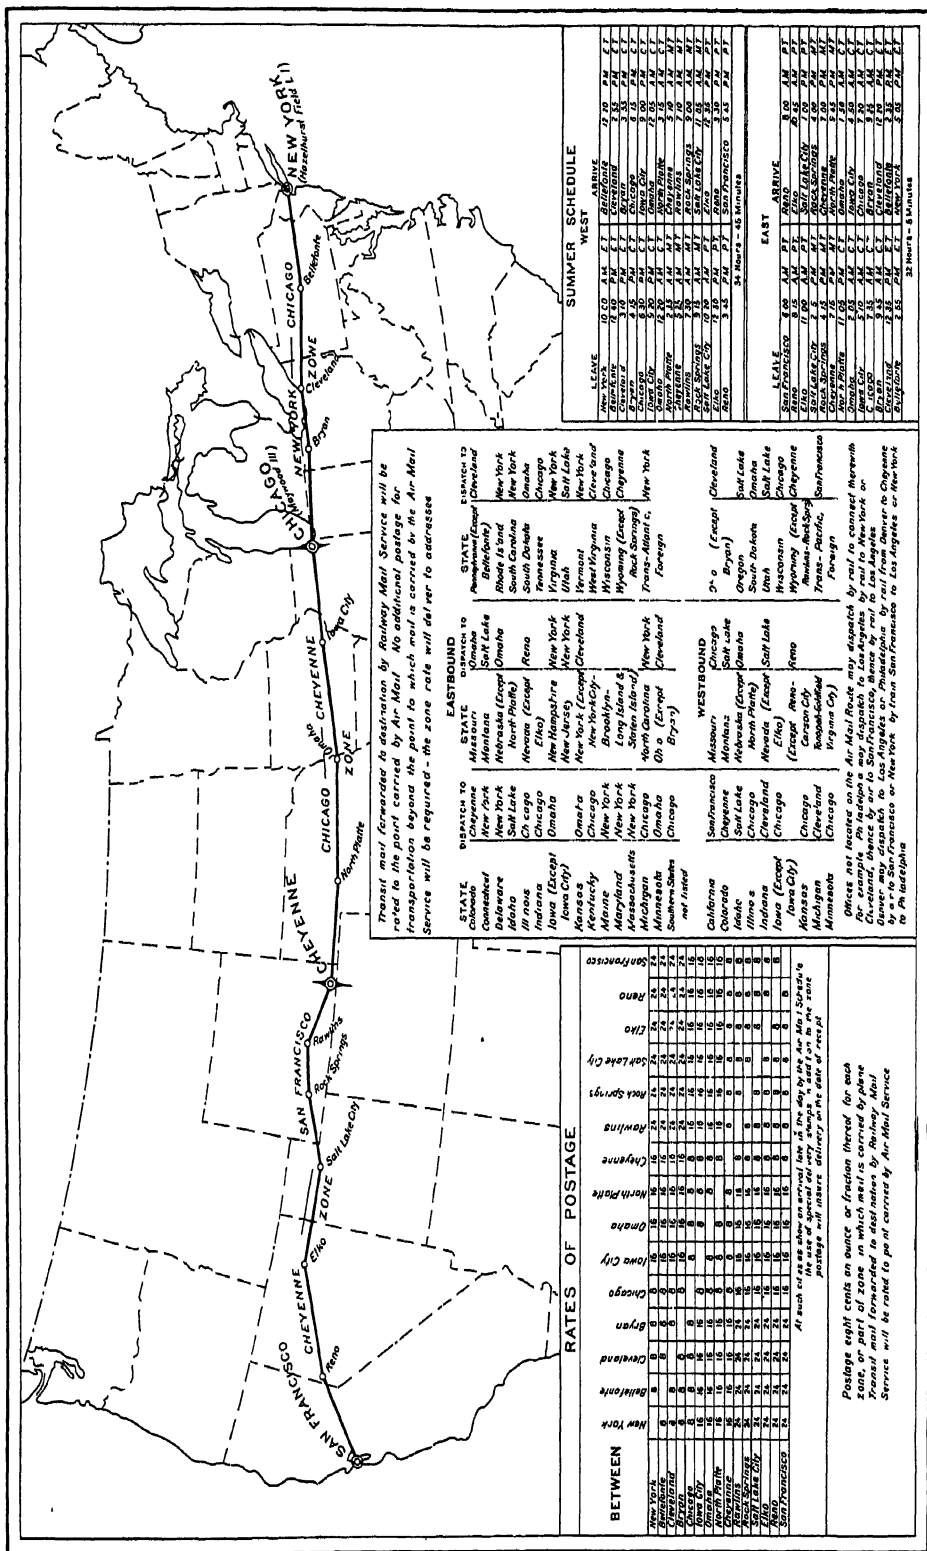

STATISTICS OF U. S. AIR MAIL

	1923	1918-1923 (inclusive)
Trips scheduled ...	8,072	33,060
Trips defaulted ...	225	2,157
Trips attempted ...	7,847	30,903
Trips uncompleted ...	111	984
Trips in fog, storm, etc.	3,745	12,118
Trips in clear weather	4,102	18,800
Miles scheduled ...	1,603,110	6,717,422
Miles flown with mail	1,545,280	6,168,395
Miles, testing and ferry	325,142	983,850
Total miles flown	1,870,422	7,152,245
Percentage of performance	96.37	91.82
Number of letters carried ...	65,295,920	225,769,520
Cost of service	\$1,910,422.54 *	\$6,204,643
Forced landings.		
Mechanical	175	1,549
Other ...	327	7,041

* Includes experimental flying at night.

Aerial Photography. During the War the observers in airplanes flying over the enemy lines very early proceeded to take photographs which gave an adequate representation of the terrain below. These photographs were very valuable both to the high commands and to the fire control officers of the various batteries, and it did not take long to develop the work on a systematic basis as a means of adding to the information contained on the military maps. After the close of hostilities it was realized that photography from airplanes had valuable scientific and commercial applications, and accordingly a number of the government bureaus proceeded to employ airplanes and photographers in coast and topographical surveys and mapping for rapid reconnaissance examinations of new country. It was found also that photographs made from airplanes afforded an extraordinary picture of a wide range of territory, and in addition to maps and topographic studies such photographs of water fronts, terminals, factory sites, and other similar objects for industrial uses in connection with engineering and construction purposes were in increasing demand. Substantial improvements were made in the apparatus, and a new film magazine was designed which permitted aerial enlargements on a more efficient basis. There was also developed in 1922 what was known as a hypersensitized panchromatic film several times faster than the film first used, and this contributed to the success and character of the pictures. One of the best of recent airplane views is shown in the plate accompanying the article New York.

The government coast surveys after some comprehensive tests reported that shore lines could be mapped accurately and expeditiously and shoals and sunken obstructions readily detected by such means. The United States Coast Survey employed photographic surveying on the New Jersey coast, at the mouth of the Mississippi River, on the Olympic Peninsula in Washington, and elsewhere. A map of Guantanamo Bay was prepared for the United States Hydrographic Office, while extensive aerial surveys were made in connection with conservation and irrigation projects. In Canada a reconnaissance survey of considerable accuracy was carried on at slight expense and with considerable speed on the boundary between northern Manitoba and Saskatchewan. Similar surveys also were made in India, while in new country generally such work

USE OF AIRPLANES IN AGRICULTURE

has proved useful and economical. Furthermore on a smaller scale topographic surveys or aerial photographs are now made of cities or suburban districts; these show the landmarks and divisions with great faithfulness and accuracy and aid materially in any scheme of city planning. For city mapping aerial surveying found constantly increased use; and in 1923, 620 square miles of Greater New York were mapped photographically, while in addition extensive surveys of similar nature were made in connection with the port developments.

The advertising value of photographs and maps made from the air was early recognized, especially in connection with the sale of real estate and land development, to afford an adequate idea of the character of large industrial plants and extensive tracts of lands. Quite different from this, was the advertising known as "sky writing." Here aviators would discharge smoke-producing compounds from flying planes so as to make letters in the sky, spelling the name of some product to which public attention was to be called. Aircraft were also used to carry aloft at night illuminated signs attached to the under side of the wings.

Other Applications. In the United States the various government agents were quite willing to make extensive experiments with the airplanes for various purposes when the machines could be placed at their disposal. The Department of Agriculture carried on some notable experiments to combat various insect pests, in which powdered calcium arsenate was distributed over cotton plants from an airplane flying at heights of 25 to 50 feet. This dusting of the cotton plants with the calcium arsenate worked effectively to destroy the boll weevil and was found very practical. (See PLANTS, DISEASES OF.) The gypsy moth was attacked in somewhat similar experiments carried on with a motor balloon, while in the Philippines a plague of locusts was handled in the same manner. Not only in surveys but in crop reporting, aircraft were used extensively and afforded a rapid and convenient method of obtaining information as to the extent and condition of crops. The patrol of the forests by airplanes during the dry season, as in some of the Pacific States, proved a very efficient way to detect incipient fires; a report by radio telephone would immediately bring the matter to the attention of the nearest forest ranger or fire fighting force.

International Aeronautic Federation. On Oct. 14, 1905, the International Aeronautic Federation (Fédération Aéronautique Internationale, F.A.I.) was formed, for the purpose of recording aeronautic performances throughout the world and soon became the sole international authority in aeronautic sport. The authority of this body in aeronautic sport and technical matters was recognized and duly enforced by national aero clubs or aeronautic associations of the following countries in 1924: Argentina, Austria, Belgium, Brazil, Chile, China, Czechoslovakia, Denmark, Finland, France, Great Britain and Ireland, Italy, Japan, the Netherlands, Norway, Poland, Portugal, Rumania, Serb-Croat-Slovene Kingdom, Spain, Sweden, Switzerland, Uruguay, and the United States. The headquarters of the F.A.I. are in Paris, France. Its representative in the United States is the National Aeronautic Association.

National Aeronautic Association. On Oct.

12, 1922, the National Aeronautic Association was formed at Detroit, principally to "foster, encourage and advance the science of aeronautics and all kindred and allied sciences." This national body maintained its headquarters at Washington, D. C., and took over the function formerly exercised by the Aero Club of America as the national representative of the International Aeronautic Federation, transmitting to the headquarters of that body for approval records and other matters requiring international sanction.

Aeronautic Chamber of Commerce. In 1921 there was also established with headquarters in New York City the Aeronautic Chamber of Commerce of America, made up of persons, firms, and corporations engaged in the business of manufacturing, buying, selling, and dealing in aircraft motors and aircraft parts and accessories of every kind, and to advance in general aeronautical industry and commerce. In addition to various activities of a purely commercial nature, this organization in 1919 began the publication of *Aircraft Year Books*, authoritative annuals which soon established themselves as invaluable to the student of aeronautical progress and to which this summary is indebted.

Bibliography. Since 1914 the literature of Aeronautics has been increased by a number of notable works dealing with theory and practice. Both military aeronautics and the engineering and constructive sides are treated in the following representative books: Loening, *Military Aeroplanes* (Boston, 3d ed., 1916); Muller, *Manual of Military Aviation* (Menosha, Wis., 1918); Page, *Aviation Engines* (New York, 2d ed., 1919); Rathbun, *Aeroplane Construction and Operation* (Chicago, 1919); United States Navy, Bureau of Navigation, *Courses of Instruction and Required Qualifications of Personnel for the Air Service of the Navy* (Washington, 1916); Fales, *Learning to Fly in the United States Army* (New York, 1917); Hayward, *Practical Aviation* (Chicago, 1919); Shaw, *A Textbook of Aeronautics* (London, 1919); Williams, *The Dynamics of the Airplane* (New York, 1921); Chadwick, *Aviation Engines* (New York, 1919); Chatley, *A Textbook of Aeronautical Engineering* (3d ed., London, 1921); Wilson, *Aeronautics* (New York, 1920); Cowley, *Aeronautics in Theory and Experiment* (2d ed., London, 1920); Wiener, *Flieger Kraftlehre* (Leipzig, 1920); Vivian and Marsh, *A History of Aeronautics* (London, 1921); Mitchell, *Our Air Force* (New York, 1921); Raleigh, *War in the Air* (vol. 1, Oxford, 1922); Sykes, *Aviation in Peace and War* (London, 1922); Fuchs and Hopf, "Aerodynamik" in *Handbuch der Flugzeugkunde Band 2* (Berlin, 1922); Hurt and Laidler, *Elementary Aeronautical Science* (Oxford, 1923). An important technical work based on sound experimentation was the record of the Göttinger Aerodynamic Laboratory, *Ergebnisse der Aerodynamischen Versuchsanstalt zu Göttinger*, edited by Dr. L. Prandtl in collaboration with C. Wieselsberger and Dr. A. Betz (2 vols., Munich and Berlin.)

Much valuable material is to be found in the *Technical Notes* of the National Advisory Committee for Aeronautics, published from time to time by that body at Washington, D. C.

Annuals. *Aircraft Year Books* annual beginning with 1919 (New York). A valuable summary of the world's progress and invaluable

in its discussions of American developments; Jane, *All the World's Aircraft* (London).

Periodicals. *International Aeronautics* (New York); *Aviation* (New York); *Aeronautical Digest* (New York); *Society of Automotive Engineers Journal* (New York); *U. S. Air Service* (Washington, D. C.); *National Aeronautical Assn. Review* (Washington, D. C.); *The Royal Aeronautical Society Journal* (London); *Flight* (London); *The Aeroplane* (London); *L'Aéronautique* (Paris); *L'Aéroplane* (Paris); *Bulletin de la Fédération Aéronautique Internationale* (Paris); *La Technique Aéronautique* (Paris); *L'Indicateur Aérien* (Paris); *Revue de l'Industrie Automobile et Aéronautique* (Paris); *Technique Automobile et Aérienne* (Paris); *Revue juridique internationale de la locomotive aérienne* (Paris); *L'Air* (Paris); *La Conquête de l'Air* (Brussels); *Luftfahrt* (Berlin); *Zeitschrift für Flugtechnik und Motorluftschiffahrt* (Berlin); *Illustrierte Flug-Woche* (Leipzig); *Wissenschaftlichen Gesellschaft für Luftfahrt, Berichte und Abhandlungen* (Munich); *Flugsport* (Frankfurt). See INTERNAL COMBUSTION ENGINES; PHYSICS; STRATEGY AND TACTICS.

ÆSTHETICS. In this as in most other sciences of man, the empirical and the metaphysical are so intermingled that scarcely a writer can be found who does not at one point or another confound the two. The modern tendency is to reject metaphysical interpretations and to concentrate upon the positive scientific aspects of problems, but more often than not this praiseworthy approach, because it is unaided by any philosophic analysis of the concepts involved, results in metaphysical dogmas baptized in the name of science. All of these contain much empirical truth; but this truth, when generalized out of its proper context, becomes an obstacle to further truth. With this word of caution, a survey may be attempted of the flux of æsthetic theories since the beginning of the War. In this period the philosophic school was represented by Bosanquet and Croce. Both of these men, with somewhat varying viewpoints, made the idea of the beautiful into a *drapeau* or standard around which to orient much if not all of the activity of life. Bosanquet stressed chiefly the Greek notion of contemplation, in which the finite being finds a brief but ineffable union with the eternal and the absolute. Croce's conception reflected more the dynamic and active aspect of æsthetic experience; he made all art and even the enjoyment of art consist in the expression of an intuition. This intuition, it may be explained, is really nothing more than the act of judgment or perception in so far as it affirms, perceives or creates a unity. The æsthetic experience, according to both Bosanquet and Croce, is created by the perceiving subject; created entirely, according to Croce; created by the mind in an act of union with a reality which he does not completely control, in the more Platonic conception of the British philosopher.

The philosophic view of æsthetics deliberately ignores the more empirical problems as to what makes a specific object beautiful. This line of attack has been taken up by the psychologists and sociologists of æsthetics. In psychology the effort was made for a long time to run down the æsthetic experience by experimentally confronting the state of mind with the laboratory stimulus which a subject was so indiscreet as to call beautiful. This method yielded no results of

any consequence. Out of this approach, the notion of empathy, what the Germans call *Einfühlung* or sympathetic attribution of qualities to an object, alone has survived. Researches into the psychology of æsthetics have been continued along more literary, less rigidly experimental lines. Among those who worked in this field may be named Langfield, Marshall, and C. K. Ogden.

The sociological approach to æsthetics was prevalent in the writings of the French æstheticians. What they attempted to do was to treat æsthetic phenomena in much the same way that modern scholarship treats moral and religious customs, as a function of the changing society. This approach has yielded more results in connection with literature and architecture than with the fine arts. We come here to the question of *motifs*, which are the carriers, as it were, of the æsthetic emotion. There can be no doubt that these *motifs* are responsive to social changes. A corollary more or less improperly deduced from this fact is that art and literature should be used as vehicles for social and moral propaganda. This view was largely championed by political radicals and others interested in morally reforming or revolutionizing society. In Soviet Russia, it may be noted, the revolutionary conception of art and culture was carried to an extreme. The attempt was made to create a special culture representative of the proletariat—the so-called *proletkult*. The absurdity of the programme became apparent even to such men as Trotsky, who in 1923 threw all his influence against the movement. In times of social stress, it is also to be expected that art would be used as an agent for the conservation of values. This tendency was manifested in practically all countries. In America the group headed by Irving Babbitt, Paul Elmer More, and Stuart P. Sherman expounded a certain variety of classical humanism, which was to serve as a bulwark against the subversive influences of social romanticism. In France the jealous courting of the muses by rival social factions was to be seen in the clash of the *Action Française* group with the writers of advanced opinions affiliated with the *Clarté* movement. From a reaction against the attempts to drag æsthetics into the politics of the right and the politics of the left developed a recrudescence of the ivory tower conception of art. The *Creed of an Æsthetic* was loudly proclaimed in England and America by such men as Clive Bell and Leo Stein. Such manifestoes were met by the iconoclastic fire of Bernard Shaw, who knew better than most radicals how to synthesize art and social idealism without disobeying the dictates of good sense. An interesting sidelight on the philosophic aspects of this problem is provided in a prize memoir submitted by Charles Lalo to the French Academy of Moral and Political Science. To the question whether art can emancipate itself from morality, M. Lalo replied that they ought to live together in Platonic friendship. The union is difficult, but it is also necessary and unavoidable.

No exposition of modern æsthetics can be regarded as complete without a discussion of psychoanalysis. The doctrines of psychoanalysis contain gleanings from a number of philosophies. In their emphasis on the will to live and the expression of the unconscious they are linked up with Nietzsche, von Hartmann, Schopenhauer, and their various intellectual ancestors. But besides these conscious philosophical elements,

there is in psychoanalysis a subconscious tendency, to use a Freudian term, to view all things from the point of view of the psychiatrist. The therapeutic value of art was recognized as early as the days of Aristotle; in a vaguer manner the relation of art to the pathological expressions of the sex instinct was also perceived. The distinct and daring originality of psychoanalysis lies in the fusion of these scattered intuitions into a more or less coherent system. Art, according to Pfister's version of psychoanalytic doctrine, is the expression or sublimation of inhibited tendencies. By the act of objectification, the artist gets relief from his emotional sufferings. This theory at once accounts for the prevalent preoccupation of art, particularly the literary arts, with sexual themes, for there is no doubt that in civilized society, it is the sex instinct rather than the food and shelter instinct which because of its imperiousness must needs be restrained.

From the point of view of the psychiatrist, who must take the biological categories for granted, it is inevitable that art should be regarded as a biological safety-valve. But this is obviously not the whole story. The instincts and tendencies which the psychiatrist accepts as given, the philosopher would call into question. Freud himself, when in his philosophic moments he transforms all tendencies into derivatives of the great *Libido*, becomes a metaphysician, and as such must take all the risks of metaphysics. The *Libido* cannot have a concrete sexual significance; it becomes the *Eros* of Plato, the *will to live* of Schopenhauer, the *intellectual love of God* of Spinoza. But these conceptions are beyond the realm of empirical science, although they make the shortcomings of that science comprehensible.

Bush, Leo Stein and Katherine Gilbert in *Journal of Philosophy*, vol. xx, 1923; articles by Clive Bell in *The New Republic* (1916-23), and Bernard Shaw's reply to Bell, *ibid.* (1922); also article by Stuart P. Sherman on literary movements in the United States in the French *Revue de Métaphysique et de Morale*, vol. xxx (1922).

AFFLECK, SIR JAMES ORMISTON (1840-1922). A distinguished consulting physician and extramural teacher of clinical medicine of Edinburgh. He was educated at Edinburgh University and associated during most of his medical career with the Edinburgh Royal Infirmary and the Longmore Home for Incurables, of which he was co-founder. He was an authority on eruptive fevers. Besides being an ex-

aminer in medicine at Edinburgh University, he was medical editor of the ninth edition of the *Encyclopædia Britannica*. He was a Fellow of the Royal College of Physicians of Edinburgh (1875) and was knighted in 1911.

AFGHANISTAN. An independent monarchy of Central Asia bounded by British India on the South and East, Persia on the West, and Russian territory on the North. The southern boundaries, long undetermined, were fixed by a convention with Great Britain in 1921. The total area is estimated at 245,000 square miles, the population at 6,380,500. The dominant racial element was the Afghan, which embraced Islam, and the leading languages were Persian and Pushtu. The capital, Kabul, had an estimated population of 150,000. The other large cities were Kandahar (31,500) and Herat (20,000). The activities of the Afghans continued to be centred in the plains and valleys, and agricultural and grazing products were the chief support of the country. Copper and lead were reputed to be found in the northern districts, though no extensive mining was carried on. Gold mines were worked under the British at Kandahar. The trade was chiefly carried on with India and Bokhara. The exports into India included timber, fruits and vegetables, grain, silk, cattle, hides, tobacco, asafoetida, and particularly wool. The articles imported from India included cotton goods, indigo and other dyes, sugar, hardware, and silver treasure. In 1917-18 the Indian statistics reported for this trade exports into India of £1,147,000; imports from India, £1,258,000; for 1920-21, exports, £1,328,500; imports, £1,543,200, for 1921-22, exports, £809,500; imports, £1,353,700. No large improvements were made in the modes of transportation, and Afghans still resorted to camel and horseback. Intercourse was somewhat furthered by the establishment of telephone communication between Kabul and Kandahar, Jaka and Jalalabad. Under the Amir Habibulla, motor roads were constructed for short stretches, principally from Kabul to Kandahar, and from Kabul to Dakka.

In the period 1914-24, Afghanistan played a part in Central Asiatic affairs that seemed hardly warranted by its isolation geographically and its backward state economically. Its position between Russia and India and the fact that it remained one of the few countries still preserving the spirit of militant Islam enhanced this importance. Afghanistan, during the decade, was thus courted assiduously by Russia, Great Britain, and Turkey in turn. The friendly relations that the British government of India had maintained with Afghanistan since 1907 served the Allies in good stead during the War. With the outbreak of hostilities in 1914 the British succeeded in securing a pledge from the Amir Habibulla Khan, that his country would observe a strict neutrality. The Amir's position became increasingly difficult with Turkey's entrance on the side of Germany for attempts were made by German and Turkish officers and Indian nationalists to preach a Holy War. The Amir successfully kept the Afghans aloof from the struggle, and as a result of his activities in checking the unruly frontier tribes he earned the lasting gratitude of the British Indian government. Unfortunately for Great Britain's peace, Habibulla was assassinated on Feb. 20, 1919. His successor, Amanulla Khan (the third son of the late Amir), at once proclaimed the

external independence of the country and attempted to establish relations with the Soviet government at Moscow. An Afghan army was dispatched to the Indian frontier in May, 1919, and but for the prompt action of the British might have caused serious disaffection among Indian Moslems. Fighting with irregular Afghan troops continued until the signing of peace in August, 1919. As a result of the Anglo-Afghan treaty, Afghans were denied the privilege of importing arms through India; the Amir's demand for the payment of the arrears of the national subsidy was refused; and the subsidy was entirely discontinued. On the other hand the treaty freed Afghanistan from its dependence upon the British government for its external policy, and left the country free in both its domestic and international relations. The awakening interest of Soviet Russia in eastern affairs served further to complicate matters. A Soviet mission from Moscow arrived at Kabul in January, 1920, and negotiated a treaty which caused the British Indian government grave concern. This document, signed at Moscow on Feb. 28, 1921, provided for the establishment of five Russian consulates in Afghanistan, several of them to be near the Indian frontier; it recognized the independence of Bokhara and Khiva, and promised the Amir a yearly subsidy of one million gold rubles to replace the discontinued British grant. The Russians also pledged themselves to construct a telegraph along the line of Kusha-Herat-Kandahar-Kabul. This new Afghan temper was further encouraged during this period by the activities of the Turkish Nationalists, who signed with Afghanistan at Moscow (Mar. 1, 1921) an offensive-defensive treaty; by the penetration of Bolshevik propaganda into Persia, by the political disorders in India, the reappearance of a Pan-Turanian propaganda, especially in 1923, and by the ever-recurring question of the political independence of Islam under the Turkish Algir. Djemal Pasha, former Turkish minister, on his arrival at Kabul in November, 1920, was accorded a friendly reception, and his aid was employed in the construction of a powerful military establishment. All these evidences of a changed attitude on the part of Afghanistan that could bode no good for Britain's security in India caused the dispatch of a British mission under Sir Henry Dobbs to the Amir in 1921. The resultant Anglo-Afghan Treaty of Nov. 22, 1921, did not succeed in offsetting the gains that Russia had made. Afghanistan was permitted once more to import arms by way of India and was again guaranteed its freedom and independence. Nothing was said of the former subsidy or the Russian grant. Nor did the Amir indicate any desire to relinquish his policy of neutrality. To aid in the commercial development of the country, Great Britain signed with Afghanistan a trade convention, June, 1923, granting favored transportation and customs rights. The same conciliatory attitude was shown in the tactful protest which the British government sent in December, 1923, when brigands on the border accounted for the slaying of several English nationals.

In 1921 a constitution for Afghanistan was promulgated by the Amir, though the form of government continued autocratic. The Amir reserved for himself the place of prime minister and in fact invested himself with most of the legislative and executive authority. Under the

promptings of European influence compulsory education was decreed, and in January, 1921, slavery was abolished. During the period, hand in hand with the greater nationalistic consciousness went a steady march toward westernization. Roads were built, agricultural methods improved, education and administration were reformed. The faith of Afghans in their own ability was shown by the opening of diplomatic relations with Russia, Turkey, Persia, China, France, and Italy; by the strengthening of the frontier guards, the inauguration of a modern discipline in the army, and the breaking of ground in 1924 for a new capital city. Foreign engineers, too, notably Italians and Germans, were invited in 1924 to take charge of road construction and the building of a railway from Kabul to Daruaman.

AFRICA. A continent of the eastern hemisphere with an estimated area of 11,500,000 square miles, exclusive of islands. Detailed accounts of African developments in the period 1914-24, political, geographic, and economic, will be found under the heads of the separate political divisions. See **ABYSSINIA**, **ALGERIA**, **EGYPT**, **MOROCCO**, **TUNIS**, **SOUTH AFRICA**, etc.

Explorations. During this period, French exploration parties carried on an intensive work in the only region still practically unknown to Europeans, the Sahara. In the eastern Sahara and in the Libyan Desert the expedition under Col. Jean Tilho (1912-17) succeeded in clearing up many doubtful points in hydrography and orography. Some of the achievements of the Tilho expedition were the demonstration of the absence of any connection between Lake Chad and the Nile Basin; the exploration of the Tibesti and Endi mountains through the penetration of a region of 1200 miles previously unvisited, and the discovery of a mountain formation in the Libyan Desert. Exact longitude and latitude determinations of many places were fixed by wireless communication with the Eiffel Tower, and surveys were completed for more than 6000 miles. Similarly Mr. W. J. H. King and Mrs. R. Forbes carried on explorations in the Libyan Desert. In 1919, Captain Augiéras, one of the best known of the African explorers, made public his researches in the western Sahara. He clearly indicated the extent of the central plateau lying between 6° and 9° W. long. and 28° to 31° N. lat. French research was also prosecuted vigorously in the little known Atlas region. Captain Augiéras, in 1920, crossed the southwestern Sahara of Morocco and as a result was able to make many corrections in the surveys of the region, particularly in the Draa plateau. In 1921 Commandant Lauzanne crossed the western Sahara by a journey of 1000 miles, and opened up a new route between western French Africa and Algeria. In 1923, Hassanein Bey crossed unexplored parts of the Libyan Desert, laying his route from Sollum to Siva, Jarabub, Jalo, Kufara, Hawari, across the oases of Arkenu and Oswenat, to the capital of Darfur. In 1922, 1923, and 1924, particularly, French energies redoubled, so that these years saw at work the following expeditions: the irrigation problems of the Niger Valley under Proust, Valude, and Audoin; the collection of fauna and flora of the mountains of the Sahara under Babault; Tunisian ornithology under Balzac; fauna and flora of Central Africa under Bruneau de Laborie. In the Nile Basin, English parties explored the Sobat river system, the country be-

tween Bahr-el-Jebel and Lake Rudolf, and the divide between the Congo and Nile Rivers. In Central Africa, boundary commissions representing the British, Belgian, and Portuguese governments, surveyed the Congo-Zambezi watershed (1911-14), for the more exact determination of frontiers. A French-British commission set to work in 1922 on the determination of the Darfur-Wadai boundary. War operations added much to the knowledge of the whole continent, not only ethnologically but geographically; for this, the airplane was used to advantage. In 1920 a British aviator, flying over the Nile Basin, discovered a hitherto unknown range of volcanic hills north of Khartoum. It is interesting to note that the end of the War saw an awakened interest in scientific and economic research apart from pure geographical exploration. The activities of the French in the Sahara have been alluded to. A British expedition (1919-20) under the Rev. John Roscoe carried on extensive ethnographical investigations in the Uganda. Biological expeditions also figured prominently. A Smithsonian Institute party was maintained in Central and South Africa, covering the Transvaal, Kafue River valley, Lake Tanganyika, and the Budongo forest, for the collection of fauna and flora. One investigator (Mr. L. H. Shantz) gathered 1600 specimens of plants, including forage and nut plants, fruits and vegetables, for introduction into the United States. Similarly, in 1921, Prince William of Sweden in explorations in the regions south and southwest of Uganda, collected 1000 mammals, 2000 birds, and more than 6000 insects. Italian research workers discovered in Eritrea, near the Abyssinian frontier, important bodies of chloride of potash. Finally, in 1922-24, of the many expeditions at work, may be noted the investigation of the etiology of the tribes in the Mongalla district by an Anglo-Egyptian group and the exploration, for geographical and zoological purposes, of the Central Sahara by the British and Rothchild Museums.

Communications. Hand in hand with the geographical researches went the extension of the means of communication. An Atlantic-Indian Ocean route by water and rail was completed in 1914-15, so that it became possible to travel from west to east by water along the Congo, thence by rail from Kakalo on the Upper Congo to Albertville on the west shore of Lake Tanganyika, across the lake by water, and finally by rail from Kigoma to Dar es Salaam on the Indian Ocean. An east-west route along South Africa was similarly completed in 1915 so that Walfish Bay and Delegoa Bay became linked. Along the Cape to Cairo route the progress made was from Ndola on the Belgian Congo frontier to Bukama, a distance of 442 miles (1909-18), and extension of this line along the Lualaba River to a point better adapted for large vessels. Thus it was possible to travel from Cairo to the Cape by rail and water almost completely, except for two breaks of 300 miles, one from Tabora to Mwanza on the Victoria Nyanza, the other between Nimule and Rejaf along the Upper Nile. The territorial changes after the War brought the Cape-to-Cairo line wholly within British territory, so that it was evident that the next few years would see the work pressed to completion. Two other general schemes need mention. Railroads were started by the French from Dakar

(Senegal), Konakry (French Guinea), Abidjan (Ivory Coast), and Katonu (Dahomey), with the purpose of pushing all of them into the French Sudan and then uniting all the lines by a single railroad running from west to east. The work was delayed during the War, and the French were slow up to 1924 in taking it up again. The 1924 announcement of a north and south Saharan railway project was even more ambitious. After a spirited domestic controversy the French government announced its acceptance of the Pabatie route which called for a railway line from Arzeu and Oran in Algeria through Tosaye on the Niger to Wagadagu, the capital of Haute Volta in the "Loop" of the Niger. Of this, 112 miles were already built across the Atlas range to Raz-el-Mao; the scheme called for the construction of 2090 miles more at a cost between 1,400,000,000 and 1,700,000,000 francs. (For local railroad construction see under the headings of the separate African countries and territories.) A further development was the use of the airplane as a means of communication and transport. In 1920 two British aviators flew from Cairo to Cape Town, a distance of 5206 miles, in 72 hours of flying time. In the same year a French plane flew across the Sahara from Algiers to Dakar. An interesting experiment was undertaken in December, 1922, when an expedition of five motor cars with caterpillar attachments made a successful journey to about 2000 miles across the Sahara from Tugurt (Algeria) to Timbuktu (on the Niger). The whole trip took only 20 days.

History. The map of Africa, in the period 1914-24, was subjected to many changes as a result of the War. Shortly after the outbreak of the hostilities in Europe, Belgium inquired of France and Great Britain whether they intended to maintain the neutrality of territories in the conventional basin of the Congo, in accordance with the General Act of the Berlin Conference, of Feb. 26, 1885; the German government, likewise, proposed the maintenance of neutrality in this region, on the ground that solidarity of the white race was necessary to preserve European ascendancy in Africa. Great Britain and France, having already begun hostilities against the German colonies, rebuffed the German offer of neutrality, and proceeded, with some aid from the Belgian Congo, to conquer the German possessions. British forces from the Gold Coast and French from Dahomey mastered Togoland in August, 1914, German Southwest Africa was successfully invaded in September, 1914, and occupied before July, 1915, by British South African troops. French and British columns, convergently penetrating Kamerun, completed the conquest of that colony in the spring of 1916, after encountering stubborn resistance. German East Africa, resolutely defended by a small German garrison supplemented by native contingents, was not swept clear of German forces until November, 1917, and then only after an ambitious plan of invasion, designed by General Smuts, had been carried out by British, South African, Indian, and native troops and coöperating Belgian forces. During the War France and Great Britain by secret agreements arranged in advance the partition of the German colonies, and by the Treaty of London (1915) they promised Italy an extension of territory in Africa if they should succeed in carrying out their designs. The Treaty of Ver-

sailles (1919) required Germany to surrender all overseas possessions to the principal allied and associated powers, transferred all German public property in the colonies to the new possessors, exacted reparation for damage done to French nationals by German encroachments in French Equatorial Africa before the War, and compelled Germany to relinquish all former treaty rights in the French protectorate of Morocco. The Treaty further provided that Togoland, Kamerun, and German East Africa should be Class B mandates, with safeguards of native rights and of the open door, whereas German Southwest Africa should belong to Class C, to be administered as an integral part of the mandatory; but the distribution of these mandates was left to the allied powers. A preliminary division of the territories was effected by the Supreme Council on May 7, 1919, as follows: German East Africa to Great Britain, German Southwest Africa to the Union of South Africa; Togoland and Kamerun to be disposed of by Great Britain and France. Subsequently the districts of Ruanda and Urundi, in the northwestern part of East Africa, were assigned to Belgium as mandatory; and the remaining nineteen-twentieths of East Africa, under the new name of Tanganyika Territory, became a British mandate. Of the Cameroons (former Kamerun), about five-sixths went to France, and only a small strip along the Nigerian border to Britain. Togoland was split, France taking almost two-thirds and Britain a little more than one-third. The mandate for German Southwest Africa (now Southwest Africa Protectorate) was formally approved by the Council of the League on Dec. 17, 1920; the Class B mandates for the other German Colonies, divided as described, were delayed until July 20, 1922. Other minor adjustments were made. Portugal recovered a district known as the Kionga triangle, which had been included in German East Africa. In order to insure an unbroken route for the Cape to Cairo Railway, Belgium transferred to Britain a strip of Ruanda-Urundi. Moreover, in fulfillment of the Treaty of London by which Italy had been promised compensation for Anglo-French gains, territorial concessions were made to Italy. Italy had desired territorial additions in French Somaliland (particularly Jibuti); the extension of Tripoli to Lake Chad; rectifications in the Libyan Desert in the neighborhood of the oasis of Jarabab; and the addition of territory along the Juba River. France ceded to Italy the Ghadames and Trummo districts on the western border of Italian Libya; further than this France would not go. Egypt, at Britain's behest, transferred a long, narrow strip, the Jarabab region, to extend the eastern frontier of Libya. Great Britain expressed herself in 1919 as willing to make concessions to Italy by additions to Italian Somaliland, but the Italian demand for more territory left the question open. In 1924 Ramsay MacDonald declared for the English government that it, like the former Baldwin government, planned to link the disposition of Jubaland with that of the Dodecanese, and inasmuch as Italy had received the latter by the treaty of Lausanne (1923), there was little likelihood of any favorable settlement being reached, at least as far as Italy was concerned. But in June, an amicable settlement was reached when the 1919 Milner-Scialoja line was accepted. Late in 1923 Italian ambitions encountered another set-

back in the discussions over the status of Tangiers (q.v.). Among other territorial changes were the settlement of the boundary between Wadai and Darfur in 1921 by France and Great Britain and the independence of Egypt. Egypt in December, 1914, first became a British Protectorate, and then, on Feb. 28, 1922, gained its independence under its own king and legislative assembly. The disposition of the Anglo-Egyptian Sudan still remained a source of contention between Britain and Egypt in 1924. Thus 1919-24 saw the elimination of the German territories, covering an area of 1,030,000 square miles, and the re-partitioning of Africa along the following lines:

Countries	Area square miles
Great Britain, (not including Egypt) ..	4,014,000
France	4,245,000
Italy	591,000
Spain	129,000
Belgium	910,000
Portugal	927,000
Egypt	350,000
Abyssinia	350,000
Liberia	40,000

Like other parts of the world after the War, Africa became the scene of nationalistic aspirations, which threatened white supremacy. Of the Egyptians' successful fight for native sovereignty an account is given under EGYPT; the contest between Indians and British in the Kenya Colony is recounted under KENYA; the Union of South Africa's determination to check the economic and political aspirations of the Negroes and Indians (largely the work of General Smuts) is told under SOUTH AFRICA, UNION OF. As far as the Europeans were concerned, a more disquieting movement was that of the Negroes of the continent to gain a fuller hearing for their demands for racial equality. In 1919, 1921, and 1923, representatives of Negro groups in America and Africa, more particularly from the latter, met in Paris, London, and Lisbon, under the aegis of the Pan-African Congress, and there set out a charter of liberties for their people. Their purpose was plainly the development of Africa for the benefit of Africans, and not merely for the profit of the Europeans. They sought political, educational and economic equality, the restoration of native lands, e.g., in Kenya, Rhodesia, and South Africa; the curbing of commercial exploitation, in the Belgian Congo; release from the hold of large industrial monopolies, in Portuguese East Africa, where a British-financed company rendered nugatory the good intentions of the liberal Portuguese code, and the appointment by the League of Nations of direct diplomatic representatives in the mandated territories with powers to investigate and report. It was too early to ascertain whether the movement was gaining strength. In the 1921 Congress 30 countries were represented as against only 13 in the 1923 Congress. But its implications indicated a serious challenge to the purposes of European imperialism. The cry of Africa for the whites was being met by that of Africa for the Africans.

AFRICA, EARLY CIVILIZATION OF. See ETHNOGRAPHY.

AGAR, FREDERICK ALFRED (1872-). An American clergyman, born in London, England. He studied at the Louisville Theological Seminary and was ordained Baptist minister in 1893. He was medical missionary to the Congo Free State (1893-4) and after holding various pastorates he became efficiency and methods secretary of the Northern Baptist Convention in 1913. He is a specialist in church methods and is author of *Church Finance* (1915), *Dead or Alive* (1916), *Help Those Women* (1917), *Personality and Possessions* (1917), *Democracy and the Church* (1918), *Church Officers* (1918), *The Stewardship of Life* (1919), *Modern Money Methods* (American Baptist Publication Company, 1921), and several pamphlets.

AGEE, ALVA (1858-). An American agricultural educator, born at Cheshire, Ohio. He attended Marietta College and the University of Wooster. From 1907 to 1912 he was in charge of agricultural extension work at the Pennsylvania State College and from 1912 to 1918 performed the same service and was professor of soil fertility at Rutgers College. In 1890 he became associate editor of the *National Stockman and Farmer* and contributed many articles on agriculture to periodicals. From 1916 he was secretary of agriculture for the New Jersey State Department of Agriculture. He wrote *Essentials of Soil Fertility, Crops and Methods for Soil Improvement*, and *Right Use of Lime in Soil Improvement*.

AGEE, FANNIE HEASLIP LEA (1884-). An American author, born at New Orleans and educated at Tulane University. She has been a frequent contributor to *Harper's Monthly*, *Century*, *Scribner's*, *Collier's Weekly*, *Woman's Home Companion*, etc., and is the author of *Quicksands* (1911), *The Jacometta Stories* (1912), *Social Ann* (1914), *Chloe Malone* (1916), and other volumes.

AGER, WALDEMAR (THEODOR) (1869-). An editor and author, born in Fredrikstad, Norway, and educated in the common schools. He came to America in 1885. He joined the Fremad Publishing Company, Eau Claire, Wis., in 1892, and in 1903 was appointed manager and editor of *Reform*. He was also made secretary of the Norwegian Society of America and editor of its quarterly. He is the author of *Kristus for Pilatus* (1911), *Paa veien til smeltepotten* (Eau Claire, Wis., 1917), and short stories and histories in Norwegian. He is also known as a lecturer.

AGNES SCOTT COLLEGE. An institution for women at Decatur, Ga., founded in 1889. The student enrollment increased from 225 in 1914 to 500 in 1923-24, the number of members of the faculty from 35 to 55, and the library from 4000 to 11,000 volumes. The endowment in 1924 was \$850,000, with pledges of \$200,000 payable within the two years following, as compared with an endowment of \$175,000 in 1914; and the income in 1923-24 was approximately \$225,000, in contrast with \$100,000 at the beginning of the decade. The land holdings of the college were more than doubled, and the buildings were increased about 50 per cent. An extensive building programme was also projected. President, James Ross McCain, A.B., LL.B., A.M., Ph.D.

AGNEW, WILLIAM HENRY (1881-). An American clergyman and educator born in Westphalia, Kan., and educated at St. Louis University. He was ordained priest in the Roman Catholic Church in 1915 and was appointed dean of the department of Science and Mathematics at Loyola University in 1921. He has been at various times chaplain in hospitals in Illinois and New York and in the Blackwell's Island workhouse. He is a well-known lecturer in religious and educational institutions. He was at one time editor of *The Queen's Work*.

AGRICULTURAL CREDIT. This term has come into prominence in the years 1914-24 in several distinct senses, among which may be recognized: rural credit (mortgage bond loans); marketing credit (loans for the sale and carrying of farm products); and productive credit (loans made for farmers' expenses during the period of putting in and har-

vesting crops). Due partly to the growth of an agrarian movement in many quarters and partly to the unsatisfactory position of the farmer as the result of the changes in prices during and since the War, the problem of furnishing the farmer with an adequate mechanism for supplying these different kinds of credit has assumed the position of a political issue in several countries and particularly in the United States.

Rural Credit. By rural credit is meant the extension of loans to working farmers for the purpose primarily of improving their land and of equipping them with suitable farm buildings and in some cases with the more permanent and lasting types of machinery. Since the farmer has usually little or nothing upon which to base his application for credit except the title to his land, this form of agricultural credit becomes a system of advancing money upon farm mortgage. Since farm mortgages are costly and difficult to supervise and crop failures suspend interest payments and sometimes necessitate the surrender of title to the land, mortgage banking has been developed in connection with agricultural operations and has been worked out on the cooperative principle, which is intended to put behind the loan the protection of a joint guarantee derived from claims upon a considerable number of pieces of property. This plan of cooperative mortgage banking was first developed in Germany and came into definite existence about 1775, continuing in various forms since that date. Parallel systems have been introduced into nearly all of the European countries and some Oriental states with varying success. The typical form of the plan is found in an organization of cooperative groups or associations whose members' applications for loans are passed on by their neighbors or associates in the group. Under the German plan, the next step is the issue of a bond or obligation which is jointly binding on all members of the group and their lands, and which the recipient, the applicant for the loan, then sells to as good advantage as he can. Mortgage banks have been established for the purpose of assisting in this marketing process. Under other variations of the scheme, the recipient obtains his loan in money, mortgaging his land to the cooperative association, which is organized with a small capital. The association then sells the mortgage to a land bank which places it and a series of other mortgages given by contemporary borrowers in a pool or trust fund. Bonds against these mortgages are sold to investors; thus the mortgages serve as collateral to protect the bonds.

Federal Farm Loan Act. The Federal Farm Loan Act adopted in 1916 by Congress is based upon the last described form of the cooperative mortgage system. Farm loan associations are formed in designated areas under conditions prescribed in the law, and their members are borrowers only. The borrowers submit applications for loans under specified conditions and restrictions as to size, security, and valuation of the land. When such loans are approved by the association after careful appraisal of the property, the mortgages are transferred to a Federal land bank. Twelve of these banks have been organized in districts covering the whole of the continental United States. They sell bonds issued in series against the mortgages which they have thus purchased. All bonds are

guaranteed by the twelve banks. The Federal Farm Loan Board, an appointive body in the Treasury at Washington, supervises the operations of the loan associations and the banks, and assents to or rejects applications for the issue of bonds. During the period from 1916 to early in 1924, about 4500 farm loan organizations were formed, and under the cooperative principle the capital of the land banks was increased with the loan associations, which take out capital in proportion as they sell mortgages to the land banks. Thus a total of about \$750,000,000 of bonds has been placed in the hands of the public by the twelve banks. Under the Federal Farm Loan Act provision was also made for institutions known as Joint Stock Land Banks. These were to operate in somewhat the same way as the Federal land banks, except that the former were originally founded with government capital and were steadily overseen by the government. The joint stock land banks were to be organized with private capital and were to make mortgage loans direct to farmers, instead of following the procedure as in the case of the farm land banks, purchasing the mortgages from local loan associations, which obtained them from the farm borrowers who were their members. The joint stock land banks early in 1924 numbered about sixty. The total issues of bonds put out by them up to the close of 1923 was about \$300,000,000. In general, the effect of the farm loan act was undoubtedly to reduce the average rate of interest on first-class landed security by 5 to 7 per cent, according to location; and it also tended to establish a comparatively high degree of uniformity between different parts of the country.

Intermediate Credit Banks. Because farm land banks and joint stock land banks were strictly limited to mortgage security, i.e. first mortgages on farm lands, and were not authorized to make any extensions of funds for conducting agricultural business, sharp demand arose in the United States in the years 1920-22 for some system of banking which would provide for loans running up to two or three years in maturity protected by ordinary paper or chattel mortgages. Such loans were especially designed to meet the requirements of the cattle and wool raising industries and to some extent for the use of fruit growers and others who required period loans of a duration greater than could be obtained from the ordinary bank and shorter than those contemplated by the land mortgage act. On Mar 4, 1923, Congress accordingly provided for the creation of twelve intermediate credit banks to be operated in connection or as departments of the twelve land banks. Each was to have a capital of not more than \$5,000,000, the actual amount to be determined by the Secretary of the Treasury and paid in by him out of any funds in the Treasury not otherwise appropriated. Each bank was to be allowed to do business with ordinary banks and with loan associations and corporate lenders of various kinds. It was to be permitted to place its securities in trust, to issue tax exempt debentures, and to sell these to the public in an amount not to exceed twelve times its capital stock. Such debentures were to be purchasable by Federal Reserve Banks. In lieu of issuing debentures, the intermediate banks might make acceptances against commodities in warehouses; and such acceptances might be discounted with Federal Reserve Banks, so as to give the farm-

er access to the commercial banking funds of the country under specified conditions. In 1923 these banks were organized with a capital of \$1,500,000 each.

War Finance Corporation. During the War a War Finance Corporation was formed whose purpose was to make loans to hard pressed enterprises which might be unable to obtain banking accommodation through ordinary channels. The concern had a nominal capital of \$500,000,000 paid out of the Treasury. It did a limited amount of business during the War, but after the close of the struggle it was largely liquidated and practically closed under the Administration of Secretary of the Treasury Houston. The Harding Administration which came into office in 1921 expanded and revived the operations of the concern and devoted it largely to agricultural relief with direct loans to banks and under certain conditions to corporations, for the purpose of promoting export trade and enabling banks with frozen assets to obtain assistance on a long term basis on a larger scale than they otherwise could. The War Finance Corporation was extended from time to time, with operations in its most active year amounting to about \$465,000,000 of loans. When the intermediate credit banks were organized, it was supposed that they would take over the business of the War Finance Corporation, but they did not prove able to do so, owing to the less flexible conditions under which they operated. The result was successive extensions of the life of the corporation to Dec. 31, 1924.

Federal Reserve Operations. None of the long term or intermediate mortgage banking enterprises already referred to has any bearing on the question of currently financing the farmers' crops. For many years, this matter had presented serious difficulties in the United States, largely because so great a proportion of American agriculture is of a seasonal nature. Cotton, for example, which comes to maturity and is practically all gathered in by the middle of November, must be financed over the period during which it is to be consumed either at home or in the course of the exporting period. That is to say, funds must be provided from some source with which to pay harvesting and producing expenses, and other obligations incurred by the farmer during the growing season. If he sells the cotton, he is able to pay his expenses out of the proceeds so far as they go. Observation, however, has shown that in general the lowest prices of the year prevail for some weeks immediately after the peak of the harvesting season. Hence there was a desire to put the farmer into a position to carry his crop until it could be gradually sold at a price up to the average. This gave rise to the establishment of Federal warehouses and also to the adoption of State warehouse systems operating under the uniform warehouse law. It also led to the creation of cooperative marketing associations whose function is to receive the cotton from their members, store it, and carry it until favorable opportunity for selling presents itself. In order to carry the crop in this way, the farmer or the cooperative association must be able to obtain satisfactory accommodation at the banks, and in order to insure such accommodation, the Federal Reserve Act made provision for an unusually long period of credit on farm paper, six months instead of three, and also contemplated the use

of the resources of the system so far as needed for the orderly marketing of crops. Under the administration of the Federal Reserve Board, this idea of orderly marketing came to signify the holding of the crop during the consumption period, with the understanding that it should all be placed on the market prior to the advent of a new crop. What is said here of cotton applies also to other staples and is a general characterization of the crop-moving problem at large. The working of the Federal Reserve system in connection with short term farm paper has been very satisfactory, enabling the agriculturist to get at low rates all of the funds to which he could be considered reasonably entitled.

Agrarian Discontent. Very decided agrarian discontent has prevailed in the United States for several years past. One reason for it was the artificially high prices that were fixed for food-stuffs during the War. These tended to encourage farmers to bring too much land under cultivation for certain crops and to neglect the diversification of certain products. They also tended to encourage a speculative movement and inflated level of values in the farming community, with the result that many cultivators purchased or in some way took over land at valuations which could not thereafter be maintained. After the close of the War, the fixed prices for agricultural products were terminated and a considerable slump in farm prices and values set in. This reaction was by many ascribed to deflation, an effort on the part of the banks and especially of the Federal Reserve system to curtail the amount of credit going to the farmer. One outcome of this discontent was the so-called agricultural inquiry of 1921, conducted by a joint committee representing the House and Senate. The findings of the committee exonerated the system for its discount policy but blamed it for allowing expansion to occur as rapidly as it had, notwithstanding that the inevitable result was reaction and deflation. Dissatisfaction continued throughout the northwest and some parts of the Middle West, and during the years 1922-23 a considerable movement of population away from the farms occurred, with many foreclosures and defaults in mortgage loans and an unusual volume of bank failures in the farming regions. These troubles continued to be attributed to poor or inadequate credit, and the result was steady agitation in Congress and out of it for some sort of relief. One result of the agitation was the Intermediate Credits Act of March 4, 1923, already described.

Farm Cooperation. Perhaps the most practical development in the field of agricultural credit and at the same time the most helpful measure from the standpoint of the farmer himself was the development of coöperative credit associations and the coöperative marketing associations already incidentally mentioned. There was a rapid growth of both classes of institutions in the cotton and fruit growing regions and to some extent in the grain sections as well. It was asserted that the effect of coöperation in the cotton regions was to save the farmer an amount equal to about \$20 per bale of 500 pounds either in reduced marketing expenses or in actually higher prices.

The method of the coöperative association is to exact from its members an agreement to keep a specified amount of land under cultivation

for a certain kind of crop over a given period of years or at all events to cultivate no other crop on that land, thus assuring a steady supply of the product in question. The farmer agrees to deliver his output through the association and to abide by its rules, which provide for grading, holding, and selling the product under conditions determined by the board of directors and other authorities. The association then provides for financing and carrying the combined output furnished by its members. This financing has been done in two principal ways; by direct loan at banks with warehouse receipts representing the title to the cotton as collateral, and by acceptances furnished by banks with which arrangements have previously been made. The acceptances are protected by warehouse receipts in the same way and then marketed by the association, or in some cases by the accepting bank. The best of these agreements provides also for regular marketing of the warehoused crop at a specified rate per month and reduction of the outstanding acceptances in corresponding amount. This method has provided an economical and apparently very safe form of financing. Altogether the coöperative association seems to furnish the key to a difficult problem of agricultural marketing.

Future of Farm Credit. The discussion of the 1920's in the United States and elsewhere confirmed the opinion that sound farm credit can be based only on careful adjustment of acreage to demand and that the holding or storage of surplus products merely intensifies the problem of prices at a later date, even though it may temporarily advance them. Although a great number of bills were urged in Congress with a view to providing for government subsidies to farmers of specified classes or for the formation of agricultural purchasing corporations designed to fix the prices of farm products by buying at a specified rate, no legislation of the sort had been enacted up to July, 1924. The passage of such laws had become the basis of a movement represented by the so-called farm bloc in the Senate and by similar organizations in foreign legislative bodies. Improvement of marketing methods and facilities and elimination of middlemen's charges both for selling and financing appeared to offer the best solution of the problem. See FINANCE AND BANKING

AGRICULTURAL EDUCATION. During the decade 1913-23 agricultural education in the United States broadened greatly, in research, graduate and undergraduate work in colleges, courses in secondary and elementary schools and extension work. A larger measure of public funds was devoted to these enterprises than previously, and a considerable number of private institutions were devoted to the work. The interest of the farming folk in agricultural education was sharpened and found new expression through their organizations. The American system was profoundly strengthened in this period by the operation of the Smith-Lever Coöperative Extension Act of May 8, 1914 (see AGRICULTURAL EXTENSION WORK), and the Smith-Hughes Vocational Education Act of Feb. 23, 1917. The United States Department of Agriculture and the agricultural experiment stations (q.v.), which with few exceptions were departments of the agricultural colleges, supplied more largely the new information on

which improvement in the subject-matter of agricultural teaching was based.

The Agricultural Colleges. In 1924 instruction in agriculture was given in 52 land-grant colleges for white students in the 48 States, Alaska, Hawaii and Porto Rico, 25 of these in connection with State universities. It was also featured in 17 institutions for negroes in the Southern States. In 1921 instructors in agriculture in the white colleges numbered 2032 men and 96 women. The total number of students of agriculture in all courses was 32,186 men and 3183 women, of whom 751 men and 71 women were in graduate courses, 14,676 men and 487 women in four-year undergraduate courses, and 14,997 men and 1996 women in subcollegiate work, including short courses, summer schools and correspondence courses. In 1910 these colleges had only 8859 students in regular college courses in agriculture. In the land-grant college institutions for negroes, in 1921, there were 11,527 students, of whom 853 were in collegiate work and 847 in agricultural courses. In the white colleges the expenditures for resident instruction in agriculture in 1921 totalled about \$9,500,000.

The Federal appropriations for instruction in the land-grant colleges were increased under the provision in the Vocational Education Act for teacher-training and the Federal acts for Rehabilitation of Veterans of the World War. But by far the greatest increase of revenue came to these colleges through State appropriations for buildings, equipment and current expenses. The agricultural divisions of these colleges received a good portion of these funds. Many large buildings for agricultural work were erected and well equipped. Additional farms, livestock, machinery, libraries, etc., were purchased. The number and variety of courses were greatly increased. The courses in agricultural production under the heads of agronomy, horticulture, forestry, animal husbandry and dairying were strengthened in various ways, but chief emphasis was increasingly placed on the development of courses in rural engineering and in rural economics and sociology.

The Graduate School of Agriculture under the auspices of the Land-Grant College Association was held in 1914 at the University of Missouri and in 1916 at the Massachusetts Agricultural College, after which it was discontinued. This was largely due to the development of regular graduate courses leading to advanced degrees at most of the agricultural colleges and particularly at universities and the stronger colleges. In the undergraduate work special attention has been paid to better organization of the curriculum, the adoption of a group system of electives, provisions to meet the needs of individual students according to their interests and capabilities, promotion of better teaching, and recognition of the importance of expert supervision of the educational work as a whole by the appointment of directors of resident teaching or similar officers. College authorities generally agreed that during the first two years in college, students should be required to take general basic courses, including a technical knowledge of what the farmer needs to know in order to carry on his work intelligently. The specialization through group courses could then be undertaken at the beginning of the junior year.

In 1922 all the land-grant colleges had de-

partments offering courses in general psychology, educational psychology, methods of teaching and other professional studies. A number of them had courses in methods of teaching agriculture. The training of teachers of agriculture for the secondary schools under the Smith-Hughes Vocational Education Act was committed to the land-grant colleges. They had also become interested in the professional training of the college teachers. The Land-Grant College Association, through its Committee on Instruction in Agriculture, Home Economics and Mechanic Arts, urged that instructors in the technical department pursue graduate work in education and study the problems of teaching in their respective fields. Heads of departments were asked to guide young teachers and give them opportunity to teach a variety of subjects and to commit the teaching of introductory and basic subjects to experienced and successful teachers. The association also has adopted a recommendation that beginning with 1925 candidates for teaching positions in the colleges be required to have professional training.

The School of Agriculture for the American Expeditionary Force. In 1919 a unique educational enterprise was undertaken for the benefit of the American soldiers in France. This was planned and inaugurated by the Young Men's Christian Association, and afterwards was taken over by the Army Education Commission. This plan included a college of agriculture located at Beaune which enrolled 6000 students and a nearby farm school at Allery with 2000 more. Thorough extension work courses in agriculture were carried to thousands of soldiers in practically every regiment. Numerous trips to French farms and forests supplemented the classroom work. In charge was President K. L. Butterfield of the Massachusetts Agricultural College, with whom were associated a large number of the ablest agricultural educators from the colleges throughout the United States. More than 150 were selected from the army, representing 40 agricultural colleges.

Agricultural Training for Disabled Ex-Service Men. Under the Vocational Rehabilitation Act of June 27, 1918, the Federal Board for Vocational Education included agriculture in its programme for training disabled ex-service men. In 1921 the rehabilitation work was transferred to the Veterans' Bureau. Up to June 30, 1921, about 15,000 men took advantage of such training. They were distributed among the agricultural colleges and schools. Some of them could join the regular classes, but for the most part their general education was too limited to permit this and special instruction had to be given them. During the fiscal year 1922-23 more than 11,000 men were given training in agriculture. Of these, about 2000 were pursuing college courses leading to a degree, about 4000 were taking shorter college courses and about 5000 were in special practical courses. Thousands of farms and other agricultural enterprises were utilized as placement and project training opportunities for men on the job. In 1923 there were over 5000 men in institutional training and about the same number in training on the job. The latter method proved more effective, especially for men of limited education, and their health was improved.

Secondary Education in Agriculture. In 1923 there were 170 special agricultural schools, and agriculture was being taught in about 4500 high schools. About 3000 of these schools received Federal and State funds under the provisions of the Smith-Hughes Vocational Education Act of Feb. 23, 1917. This act was administered by the Federal Board for Vocational Education, which had a division for agricultural education, and by State boards in all the States. Plans for the work in agriculture, as in other subjects, were initiated in the States and approved by the Federal Board as the basis for allotment of Federal funds. The instruction was for students from 14 years of age and might include work in all-day or evening schools or in other part-time courses. Supervised practice work in agriculture during six months of each year was required of all students.

The Federal funds for vocational instruction in agriculture increased from \$547,027 in 1918 to \$1,759,219 in 1923 and were offset by more than this amount of State and local funds. The Federal fund will reach its maximum in 1926, when it will aggregate \$3,021,987. In 1918 vocational agriculture was taught in 609 schools by 895 teachers to 15,453 pupils and in 1923 in 2673 schools by 3012 teachers to 71,298 pupils. A report of the Federal Board showed that of 8340 students who had received one or more years of such instruction, 4888 were engaged in farming. Experience showed the advantage of connecting the Smith-Hughes work in agriculture with the local high schools because thus the pupils lived at home and as a rule carried on their practice work on the home farm. This also made the school a factor in improving the agriculture of the local community. The agricultural instruction in the Smith-Hughes schools was largely conducted on a project basis. This led to an attempt by the Federal Board, in coöperation with the division of agricultural instruction in the Department of Agriculture, to make job analyses of the different agricultural enterprises and several publications were issued showing how such analyses may be used in the teaching of agricultural subjects.

Elementary Agricultural Education. 1923 and 1924 saw considerable progress in the teaching of agriculture in the rural elementary schools. The former year, 28 States had laws requiring elementary agriculture to be taught in the rural schools, and several others encouraged such teaching. In about 20 States elementary agriculture and nature study were taught effectively in many rural schools, especially consolidated schools. A number of the State departments of education published outline courses in elementary agriculture for the use of teachers, partly by coöperation with the agricultural colleges and the United States Department of Agriculture. The agricultural colleges, through summer schools and in other ways, were helping to train teachers for this work. These colleges and the United States Department of Agriculture were also aiding the rural teachers by the distribution of publications, lantern slides and other illustrative material and by personal services of the State and county extension agents. The boys' and girls' clubs organized by the extension agents are in many cases closely associated with the rural schools. Many normal schools and high schools have courses through which teachers are trained for

work in agriculture and nature study in the rural schools.

Foreign Countries. Institutions for agricultural education increased in number and variety throughout the world, including colleges, secondary and practical schools and special schools for horticulture, forestry, dairying, poultry, etc. In the European countries the regular work of the agricultural institutions was greatly abridged during the War, but at that time and afterward, special arrangements were made for the instruction of disabled soldiers in several countries. In Great Britain the Development Commission under the law of 1909, in coöperation with the Ministry of Agriculture and Fisheries, greatly stimulated agricultural education and research, through the establishment of centres of research at the Rothamsted Experiment Station, and at Cambridge, Oxford, and other universities and colleges, promotion of the resident teaching at these and other institutions, assistance to local authorities in maintaining short courses of 10 to 12 weeks (called farm institutes) by itinerant teachers and broadening of the extension work through county representatives and other expert advisory officers. For this work Parliament had made large grants of money to supplement local funds.

In Canada, agricultural colleges and the teaching of agriculture in many high, consolidated and elementary schools were maintained in all the provinces under direction of the provincial departments of agriculture and education, aided by the Dominion Department of Agriculture, which beginning with Mar. 31, 1914, had an appropriation of \$10,000,000 for 10 years to be distributed among the provinces according to population for education and research. In 1917 the Agricultural Instruction Act, providing for district extension agents, made special arrangements for instruction of convalescent soldiers by these agents. At St. Joseph, Trinidad, the West Indian Agricultural College was opened for students, Oct. 16, 1922. It was designed as a centre for research and education in tropical agriculture. The Imperial Department of Agriculture for the West Indies was transferred from Barbados and located at this college.

In Belgium a royal decree of Apr. 8, 1920, reorganized the higher agricultural education. The course for a bachelor's degree was to occupy four years, but a license in agricultural science could be obtained on completion of a two years' course. A higher normal institute of farm management has been established at Laeken. In France the law of Aug. 21, 1912, reorganized the departmental and communal system of agricultural education and provided a bureau of agricultural services for each department. Laws enacted in 1918 and 1920 further systematized agricultural education and provided better opportunities for specialization in different branches of agriculture, the training of teachers, winter courses for farmers, continuation courses for boys and girls leaving the primary schools and agricultural instruction for women.

In Denmark, agricultural education was given in the Royal Danish Agricultural College at Copenhagen, at which the regular course occupied two years, with additional special courses covering two more years; and in 22 agricultural schools, with nine-month courses and special shorter courses lasting from a few days to several weeks. In Norway there were the high school of agriculture, with a three-years' course; the

State Training School for Teachers to Small Holders, with a two-years' course; and 41 county or district agricultural schools, with courses of six to eighteen months and several schools of forestry, horticulture and dairying.

In China an educational survey in 1916 showed the great need of more practical education, and that year the National Association of Vocational Education was formed. The National Alliance of Provincial Educational Associations also favored vocational education. This movement greatly stimulated progress in agricultural education in colleges and secondary and primary schools. In 1919 there were seven colleges with 1550 students and two missionary colleges at Canton and Nanking, with 225 students; 54 secondary schools with 640 teachers and 5998 students; and 240 primary schools with 622 teachers and 9784 students.

An interesting development of agricultural education was connected with missionary colleges and schools in several countries. Many mission boards were promoting this side of their work, and young men were being trained in colleges in the United States and elsewhere for it. A survey in Africa by the African Education Commission showed the importance of correlating missionary enterprises with the agricultural and community life of the African peoples, through practical instruction and extension work in connection with mission schools.

AGRICULTURAL EXPERIMENT STATIONS. The work of the experiment stations in the United States and Europe found unusual application during the emergency period of the War, and their officials and experts were called upon for a variety of unusual advisory service. Many of the men were drafted into war activities, while others in large numbers took positions in the industries. The drain upon the station forces was therefore a very heavy one, and for a time research suffered a temporary setback. The more important lines of investigation were, however, kept alive, and after the Armistice the forces gradually returned and State appropriations were increased to some extent. In the United States there were, in 1924, 61 separate stations, some of the States maintaining more than a single station. In addition to the main stations many branch stations were maintained for typical regions or the study of special branches of agriculture, and cooperation with the United States Department of Agriculture increased extensively. Experiment stations were maintained by the Federal government in Alaska, Hawaii, Porto Rico, Virgin Islands, and Guam, and stations were also maintained in the Philippines under the Insular Government. A system of forest experiment stations was inaugurated under the United States Department of Agriculture in 1922-23, quite largely in cooperation with the State experiment stations. (See **FORESTRY**). In addition to these public agencies, the Thompson Institute for Plant Research, supported privately, was opened at Yonkers, N. Y., in 1921. In the same year the Food Research Institute was established at Stanford University, California, with funds supplied by the Carnegie Corporation of New York, for the study of both the scientific and economic aspects of food supply and use.

The total funds of the agricultural experiment stations in the United States for 1923 aggregated approximately \$9,500,000. This compares with a little over \$5,000,000 in 1914, much of the ap-

parent increase, however, being absorbed by the increased cost of services and supplies. The stations employed 2260 persons in connection with their research and administrative activities. About half of these were members of the teaching staffs of the agricultural colleges. During the year they issued over 900 publications, which were distributed to regular mailing lists aggregating about 900,000 names, in addition to many copies sent in response to special requests. A considerable part of the technical research was published in scientific journals, which served to increase materially the volume of published matter. The stations were carrying a total of more than 5000 separate projects in 1923, covering practically every phase of the agricultural industry and varying from quite practical experiments to abstract inquiries on the frontiers of science. The growing interest in economic problems of agriculture was reflected in an expansion in that field as far as funds permitted, to include studies of production costs, marketing and distribution of products, farm management, agricultural cooperation, and the like. Among other new developments was the subject of horticultural manufactures, dealing with canning, preserving and drying of fruits and vegetables, and the utilization of residues or by-products in various ways. Another new line in the western States was work in range management and the handling of stock under range conditions. In most of the States the field of the station work has expanded on new lines, and it has become increasingly technical in order to meet the type of problem and the demand for accurate information.

In Great Britain the repeal of the war-time measure known as the Corn Production Act was accompanied by the granting of £1,000,000 for agricultural education and research, about half of which has been allocated to research and advisory work among various institutions. A new agency known as the Rowett Research Institute, for work in animal nutrition especially, was organized at the North of Scotland College of Agriculture, contributions coming mainly from private sources. In Canada, the Dominion government was compelled to withdraw its assistance to the agricultural institutions in the Provinces in 1923, which was expected to result in serious curtailment of agricultural investigation.

Despite the financial stress in France, an appropriation of 2,000,000 francs was made for experimental work in 1921, and an Institute of Agricultural Research was established under the Ministry of Agriculture, to which the existing stations and laboratories hitherto administered by the Department were assigned, with authority to establish other stations and make grants for research. This reorganization brought under the Institute 88 stations and laboratories with a total personnel of 236. A central station with regional stations for the improvement of crop plants was more recently provided for, and eight additional central stations with regional branches to deal with the principal divisions of agriculture. The foundation thus was laid for a comprehensive system of agricultural research in France, utilizing the existing structure as far as possible and materially supplementing it. The State of Minas Geraes, Brazil, inaugurated a new institution for agricultural instruction and investigation, located at Vicosa; Colombia and Salvador each provided for a series of stations, and Venezuela opened a station for agriculture and forestry at Caracas. An institute of agri-

cultural research in Palestine, with a system of local stations, was planned under the Zionist movement.

Necrology. A number of scientists prominent in the work of the experiment stations died during the decade. Among these were Dr. H. P. Armsby, Director of the Institute of Animal Nutrition at Pennsylvania State College; Dr. E. W. Hilgard, for many years director of the experiment station in California; Dr. J. H. Kastle, Director of the Kentucky Experiment Station; Prof. F. Nobbe, founder of the experiment station for plant physiology at Tharandt, Saxony, and of the first seed control station in 1869; Dr. Cyril G. Hopkins, head of the Department of Agronomy in the Illinois University and Experiment Station; Dr. William Frear, head of the Department of Experimental Chemistry and Vice-director of the Pennsylvania Experiment Station; Dr. J. C. Whitten, Specialist in Horticulture at the California College of Agriculture and Experiment Station; Dr. F. W. Woll, Professor of Animal Nutrition in the same institution and an agricultural writer; Prof. S. A. Beach of the Iowa State College and Experiment Station, a national authority on fruit growing.

In addition to the changes brought about by death, a number of the leading station directors retired, among them Dr. W. H. Jordan of the Geneva Experiment Station in New York, Prof. Charles E. Thorne of the Ohio Station, Dr. Charles D. Woods of the Maine Station, Dr. W. P. Brooks of the Massachusetts Station, Dean E. Davenport of the Illinois College and Station, Dr. E. H. Jenkins of the Connecticut Stations, and Dean Thomas F. Hunt of the California College and Station. Dr. A. C. True, long Director of the Office of Experiment Stations in the United States Department of Agriculture and more recently Director of the States Relations Service, retired from administrative duties, continuing his study of the history of agricultural education and research.

AGRICULTURAL EXTENSION WORK.

Agricultural extension work includes whatever instruction on subjects related to agriculture and country life is given by educational institutions to persons other than resident students. Most of this work is done away from the institutions, but it may include meetings or short courses held there. In the United States, courses at the institutions exceeding two weeks in duration are usually not classed as extension work. Most of the agricultural extension work in the United States is done coöperatively by the State agricultural colleges and the United States Department of Agriculture under the terms of the Smith-Lever Extension Act of 1914 and related Federal and State legislation. This act brought about a combination of three more or less distinct lines of work previously conducted by agricultural in-

stitutions: (1) farmers' institutes (see article in *NEW INTERNATIONAL ENCYCLOPEDIA*), (2) farm demonstration work (see article in *NEW INTERNATIONAL ENCYCLOPEDIA*) and (3) the correspondence and short courses, lectures at farmers' meetings, exhibits at fairs, competitive judging of live stock and other products, etc., carried on by the agricultural college.

From their beginning the agricultural colleges and the Department of Agriculture disseminated agricultural information among the farming people through correspondence, distribution of publications, and addresses at meetings by members of their staffs. The colleges gradually enlarged the scope of their extension work, particularly in the decade beginning about 1905, when extension divisions were organized. During this period the work was considerably influenced by the general movement of university extension, of which it was often considered a part. In 1908 the colleges, through their Association, began to ask Federal aid for extension work and several bills were introduced in Congress. Finally a bill introduced by Hoke Smith of Georgia in the Senate and Asbury F. Lever of South Carolina in the House was passed, and was approved by President Wilson, May 8, 1914. This act provides for agricultural extension work to be carried on by the land-grant colleges in coöperation with the United States Department of Agriculture and in accordance with plans annually submitted by the colleges and approved by the Secretary of Agriculture.

"Coöperative agricultural extension work shall consist of the giving of instruction and practical demonstrations in agriculture and home economics to persons not attending or resident in said colleges in the several communities, and imparting to such persons information on said subjects through field demonstrations, publications, and otherwise, and this work shall be carried on in such manner as may be mutually agreed upon by the Secretary of Agriculture and the State agricultural college or colleges receiving the benefits of this act."

To each State \$10,000 annually was permanently appropriated, and additional sums beginning with \$600,000 in 1914 and increasing by \$500,000 for seven years thereafter, after which \$4,100,000 annually was to be permanently appropriated. Since 1920 supplementary funds were added by Congress. To receive the additional sums the States were required to offset them with equal amounts, provided by States, county, college, local authority or individual contributions within the State.

"No portion of said moneys shall be applied, directly or indirectly, to the purchase, erection, preservation, or repair of any building or buildings, or the purchase or rental of land, or in college-course teaching, lectures in colleges, promoting agricultural trains, or any other purpose not specified in this act, and not more than five per centum of each annual appropriation shall be applied to the printing and distribution of publications."

Soon after the passage of this act the Department and the colleges generally entered into a formal agreement, through a "memorandum of understanding," under which the Department agreed to conduct all its extension work through the college, provided the college created an extension division and put at its head a director who would be the joint representative of the college and the Department and have charge of all the coöperative agricultural extension in the State. For the Department's business necessitated by this act, a committee was at first organ-

ized, but on July 1, 1915, when the States Relations Service was created, general supervision was given to the director of that service, under whom were put two extension offices transferred from the Bureau of Plant Industry, one for 15 Southern States and the other for the 33 northern and western States. In 1920 the two offices were combined and in 1923 when the States Relations Service was abolished, the Coöperative Extension Office became a part of the new Extension Service, which contains also the Office of Exhibits and the Motion Picture Laboratory. The Extension Office administers the Smith-Lever funds and direct appropriations to the Department for farmers' coöperative demonstration work, which are used mainly in connection with the Smith-Lever work in the States but also for the maintenance of the Washington Office. Representatives of the different bureaus of the Department also do extension work in the States, under the supervision of the Extension Service.

In the States the college organization consists of the extension director, leaders of county agricultural, home economics and club agents, and extension specialists in the various branches of agriculture and home economics, together with the men and women agents located in the counties. This nation-wide system of practical education for the farming people had hardly become well organized when the War brought to it unusual responsibilities. To aid in stimulating agricultural production and food conservation the States Relations Service was given \$4,348,400 in 1917 and \$6,100,000 in 1918 to supplement the regular extension funds. In war-time the extension organization was pushed forward very rapidly until over 2400 counties had agricultural agents and about 1700 counties and 200 cities had home demonstration agents. About 2,000,000 boys and girls were enrolled in clubs. The supervising officers, extension specialists and clerks in headquarters at the colleges and the department were also greatly increased in numbers. At one time about 7000 persons were included in the coöperative extension forces, which were accomplishing a great work in aiding the farmers to produce an adequate food supply and our people generally to conserve this supply. To accomplish this task it was necessary to organize the farming people more thoroughly. The extension forces, therefore, were very active in promoting the older organizations and forming new ones. In the Northern and Western States special advantage was taken of an organization called the farm bureau. This was originally a division in the Chamber of Commerce of Binghamton, N. Y., but was soon taken over by the farmers in that State, who organized county farm bureaus to work with the State agricultural college and Department of Agriculture in extension enterprises. This movement spread to other States and in war-time the extension agents were active in organizing farm bureaus in many counties.

After the War, when economic conditions aroused the farmers to the importance of coöperative marketing and legislation relating to agriculture, the farm bureaus expanded their work beyond the educational field and formed State federations and a national federation called the American Farm Bureau Federation. The farm bureaus spread into almost all of the States and became one of the strongest and most influential of our farm organizations. It was then necessary to readjust the relations of the extension

forces to the farm bureaus and to confine these forces to educational work broadly defined. When the war emergency funds were withdrawn, the number of extension workers materially decreased, though the expense of the work greatly increased and the farmers were in a very difficult situation. The people retained their interest in extension work and the number of county extension workers again increased. The emphasis in the agricultural work shifted from production to economics, particularly coöperative marketing.

In 1923, out of 3044 counties reporting agricultural products, 2097 had men county extension agents; 846 had women agents. The men included 56 directors and State leaders, 109 assistant State leaders, 2177 white county agents and assistants and 179 colored local agents. The women agents were 43 State leaders, 75 assistant State leaders, 838 white county agents and 103 colored local agents. The men and women agents did much work with children but there were also special agents for boys' and girls' clubs, as follows: State leaders 41, assistant State leaders 59, county leaders 153. In addition, there were about 750 extension specialists and several hundred clerical assistants, making a total extension force of nearly 5000. Over 600,000 boys and girls were enrolled in clubs. The total funds allotted for coöperative extension work in the United States in 1923-24 were approximately \$19,149,450, of which \$7,104,450 were Federal funds, including \$5,588,000 under terms of the Smith-Lever Act, \$1,284,450 for farmers' coöperative demonstration work, and \$30,000 for work by bureaus of the Department of Agriculture. From sources within the States \$11,955,000 were contributed, of which \$5,324,000 were State and college funds, \$5,743,000 county funds, and \$888,000 from farm organizations and other sources. In Alaska, Guam, Hawaii, Porto Rico, and the Virgin Islands, extension work was conducted by the Federal experiment stations.

Foreign Countries. Many countries had more or less elaborate systems of agricultural extension work, usually under the general supervision of departments of agriculture and often connected with agricultural colleges and schools. In England and Wales extension work was conducted through County Agricultural Councils, with approval of the Ministry of Agriculture, and aided with Government funds by the Development Commission. The work is done by agricultural organizers, itinerant lecturers, and specialists from agricultural colleges and the Ministry. A similar organization existed in Ireland. In Scotland the work was done through the universities. In Canada a large number of extension agents were employed under the supervision of the provincial departments of agriculture. Similar work was done in Australia, New Zealand and the Union of South Africa. In France under the Ministry of Agriculture were inspectors-general, directors of agricultural services and their staffs in the several departments (counties) and extension specialists. A similar system existed in Belgium. The Belgian Peasants' League, with over 90,000 members, also carried on much work. In Denmark, the Department of Agriculture, Royal Agricultural Society and local agricultural associations joined in the work. In Italy there were over 300 itinerant teachers of agriculture. The government and agricultural societies conducted the work in Norway, Sweden, Holland and Germany. There was or-

ganized work in Spain, Switzerland, Bulgaria, India, Burma, British West Indies, Chile, Argentina and other South American countries.

AGRICULTURE. The decade from 1914-24 was one of unusual significance for agriculture. The War brought it into a prominence in the countries of Europe and America which it had never before had in modern times, and the period following the Armistice was marked by a sharp reversal of prosperity in that industry and an unexpected change of public attitude towards it. The periods during and following the War represented the two extremes of stimulation and depression, from both of which the stability and the condition of farming in general suffered severely. The depression in the United States was the greatest agriculture had ever known, and in varying degrees it was in evidence in most other countries. But if the decade presented these remarkable contrasts, in America at least it also marked a new epoch in farming. The economic aspects of the industry began to receive much attention. Statistics were gathered on the cost per unit of production, the labor return of the farmer, and the factors affecting prices received by him and decreasing his share of the returns. Official standards were established for leading products, regulatory measures enacted to preserve competition and to prevent unfair price manipulation, coöperation in marketing and distribution and in buying farm supplies was given great impetus, and in general the organization of the farming people to promote their welfare and to make themselves heard in State and national legislative bodies assumed unprecedented proportions. There was a movement also towards greater adaptation of agriculture to the special conditions of localities, an attempt to shape production of large staples more definitely to actual needs, to reduce narrow specialization, and develop greater diversification as being economically and agriculturally safer and more advantageous. In no previous decade was there so much legislation looking to the interests of agriculture, some of these measures marking a decidedly new departure in national legislation and in recognition of the people living by the land.

Agriculture During the War. In most of the leading countries agriculture was well prepared to meet the unusual demands upon it. In 1913 the world crop of wheat was equal to or greater than any of record, and the oat crop ranked among the largest ever grown. In the United States the season of 1914 was notable for producing the highest total value of crops and animal products which had been recorded in the country's history, estimated at \$9,872,936,000, a part being accounted for by the rise in prices which had already set in. The wheat crop was the largest of record to that time and the cotton crop the second largest. There was a wheat surplus of about 290,000,000 bushels, mostly available for export, exceeding the amount of any previous year, including flour. The total production of the six leading cereals (including corn) was estimated at approximately 5,000,000,000 bushels or nearly half a billion bushels in excess of 1913. Compared with this, the aggregate shortage in the wheat crop of the world for 1914 was placed at approximately 386,000,000 bushels, that in Europe alone amounting to 323,000,000 bushels. The shortage in Germany was offset to the extent of about one-half by the surplus of rye production. Most

of the leading countries of Europe had been giving special attention for years to the promotion of food production. France was noted for the large number of its small farms and its thrifty agricultural class, more than half of whom were landowners.

For years Germany had pursued a policy of encouraging and safeguarding industry, leading the world in its agricultural investigation, instruction, and favorable consideration for the industry. The growing of food was looked upon as a measure for the common good and was a part of its campaign for supremacy. At the outbreak of the War Germany was producing about 82 per cent of its requirements in edible grains (including flour), 93 per cent of its meats, 92 per cent of its dairy products, 67 per cent of its poultry, and 99 per cent of its vegetables—about 88 per cent of the total food requirements of that country. France was producing about 93 per cent of the required edible grain, 98 per cent of meats, 80 per cent of poultry, and slightly more than it consumed of dairy products, vegetables, and fruits. Austria-Hungary was almost entirely self-sustaining in food supplies, while Russia was a surplus producer of food stuffs, exporting about 19 per cent of its production of edible grains. Great Britain, on the other hand, had allowed its agriculture to languish, and along with an attitude of neglect or unfavorable action, had developed the policy of purchasing its food in large measure abroad. It grew only 27 per cent of the required food grains, 53 per cent of the meats, 62 per cent of the dairy products, and 58 per cent of the poultry consumed—in other words, only about half of the food required. Prior to the outbreak of the war two-thirds of the total farm area was in permanent grass and only one-third in cultivated crops, whereas in Germany the proportion was exactly the reverse. It was said that British agriculture fed with home-grown food a third more people and employed a third more labor in 1870 than it did in 1913, because in the meantime the country had so largely turned from cultivated crops to grass farming. The war soon served to demonstrate the inadequate state of British agriculture.

At the outset all of the European countries took steps to conserve their food supplies, to increase production of the most necessary staples, and to adapt the production to the military needs and requirements of the people. The feeding of bread grains to live stock was largely restricted or prohibited. The amount of grain used for brewing and distilling was cut down, and closer milling of cereals was required, the addition of substitutes being first permitted and later enjoined. Non-essential crops like tobacco were prohibited and bulb growing and hop growing were much reduced. With the development of the aeroplane flax growing became a war necessity, and in Great Britain particularly it was stimulated and placed under strict regulation. In Germany the whole question of production was systematized and brought under Government regulation, and in France organization was carried to a high degree. Laws in the latter country permitted neglected land to be taken over by the commune. The Government subsidized the purchase of expensive labor-saving machinery by coöperative societies or communes, and bounties were offered and prices guaranteed for essential products. In most of the warring countries labor soon became scarce, owing to the

extension of the draft, and women began to take the place of men in farm work. The seriousness of Great Britain's position was intensified when the submarines became active. That country declined, however, to guarantee the price of wheat, but made patriotic appeals to farmers and landowners to plow up their grass land and pastures and increase the acreage under wheat. This met with much objection in the absence of a well defined permanent policy towards agriculture. Later such a change in farming was enjoined, and acts passed, enabling the taking over of such land and placing a penalty on neglect of owners to practice good farming.

The world wheat crop of 1915 was much the largest ever produced. Great Britain shared in this, its wheat crop being the largest in many years, but in spite of this, three-fourths of its wheat supply had to be imported. In that year the United Kingdom imported agricultural products valued at \$1,342,000,000, while France bought food products costing \$492,000,000. The United States produced the greatest wheat crop ever raised, passing the billion-bushel mark for the first time and representing about one-fourth of the entire world's production. This was in response to the appeal from Europe and to increasing prices. The export of wheat to Europe, which was less than 100,000,000 bushels before the War, jumped to two and three times that amount. In 1916 the crops of wheat, barley, oats, and maize in the Northern Hemisphere were decidedly less than in 1915, causing prices to rise and anxiety to increase. With the continuance of the War the preeminent position of agriculture in the welfare of the countries involved became more unmistakable, and its importance was conceded as second only to that of the military activities. With thousands of acres devastated, relations with other countries interrupted, and a vast number of farmers and farm laborers drafted into the army, not only unusual demands but unusual conditions had to be met. Extreme measures were taken to make the countries as far as possible reliant on their own food production.

To overcome its disadvantage Great Britain made most urgent appeals and adopted numerous measures to readjust the systems of farming. War committees and borough war societies sought to assist the farmers in the matter of information, labor, seed, fertilizers, etc., and attention was turned to the cultivation of land not ordinarily employed in agriculture, such as parks and pleasure grounds, the use of woodland for raising pigs, etc. Farmers were urged to shorten the period of grass and clover in rotations and to reduce the acreage of bare fallow. There was widespread effort to prevent the depletion of live stock in the warring countries, especially the work animals, milch cows, and breeding stock. In view of a tendency in Great Britain to dispose of cows on account of shortage of labor, the Board of Agriculture made every effort to help dairymen to retain indispensable laborers, and women were trained for milking. Scarcity of gasoline (petrol) for tractors and other machines, high prices of fertilizers and the scarcity and cost of seeds were other handicaps. Forage was unusually high and was requisitioned in large amounts by the armies. Farmers felt that the well-nigh impossible was being urged upon them. Prisoners of war, to whom there was at first objection, were success-

fully used in France and England and generally found to be submissive. In 1917 Great Britain enacted a comprehensive measure known as the Corn Production Act, guaranteeing prices of wheat for a period of six years, establishing prices for oats and barley, and fixing a minimum wage for agricultural labor. A live agricultural policy was put into effect in that country under the Defense of the Realm Act, enabling the taking over of waste lands and commons and compelling the breaking up of grass land and the use of the cultivated land in accordance with the needs of the country. It was estimated that in 1917 an additional million acres were put under the plow in that country.

When the United States entered the War in 1917, renewed efforts were given to increasing production of the essentials, for home use and for the Allies. The Selective Service Law made agriculture one of the industries for which exemption could be claimed. The United States Food Administration fixed the price of the 1917 wheat crop at \$2.20 per bushel for Number 1 hard, and a Federal Grain Corporation was formed which took over the purchase of wheat for export and for the larger flour mills. The price had risen to \$3.18 and the fixing of a price which was represented as little above the actual cost of production under war prices raised considerable opposition, but was accepted as a patriotic measure. While the wheat crop of 1917 was light, the aggregate of all cereals in the United States was approximately a billion bushels, over the average of the previous five years. In most of the Allied countries the production of cereals fell off materially, showing that Europe was fast declining in food-producing power. Restrictions on the use of any material suitable for human food became more stringent. Horses were placed on rations and even the feeding of game and migratory birds was prohibited. Shortage of tonnage and increased risk practically eliminated from the market such surplus grain-producing countries as India, Australia, and Argentina. This laid the heavier burden on the United States and Canada. The latter country had made a remarkable showing, and in 1918 responded with the largest areas on record in that country for all food crops except corn. In the United States a carefully considered agricultural programme was laid out, the first of its kind in America, in which special emphasis was laid upon the wheat crop, with the aim of a billion bushels. The necessary acreage was apportioned among the States and the duty of meeting the apportionment and assisting the farmers was assigned to the County extension agents, State Councils of Defense, and other agencies. The President in a message to the farmers called upon them for a supreme effort, and Congress appropriated \$2,500,000 to be used as a revolving fund in supplying farmers with suitable seed in certain sections of shortage, the fund being administered by the Department of Agriculture.

The response to this nation-wide campaign is better shown by acreage figures than by yields, as the season was adverse over considerable sections. The acreage in wheat exceeded the previous record by 3,500,000 acres, and the production, while it did not reach the billion-bushel goal, amounted to 917,100,000 bushels, the largest amount ever raised except in the record year of 1915, exceeding the preceding five-year average by nearly 107,000,000 bushels. Equally striking

were the results in producing large supplies of other crops, meat, and dairy products. The labor situation became even more acute, with the extension of the draft and the large opportunities offered by other industries. Organized effort was made to meet the shortage. A Boys' Working Reserve was organized, students were recruited to work on the farms during their vacation, colleges lengthened the summer vacation, and a Women's Land Army went into training. Business men, clerks, and factory operatives worked on the farms after regular hours and in their vacations to gather in the world's bread crops without loss. On the whole the results furnished a new evidence of the remarkable resourcefulness of American agriculture.

Under stress of the emergency Great Britain redoubled its efforts and added another 2,000,000 acres to its tilled area, the increase in wheat being 752,000 acres. The labor situation became increasingly acute, and unusual and part-time labor had to be resorted to. More than 300,000 whole-time and part-time women workers were reported to be engaged on the land in the United Kingdom. The acreage in wheat, barley, and oats in that year was the highest ever recorded in British agriculture and that in potatoes the largest since 1872. The harvest was not only greater than in any previous year, but the yields per acre were equal to the best recorded. It was estimated that the production would provide forty weeks' supply of bread stuffs for the entire population of the United Kingdom at the prevailing scale of milling and consumption, a remarkable achievement for a country which only a few years before imported its food stuffs in such large measure. The estimate, moreover, takes no account of food produced on allotments, of which there were fully 800,000 more in England and Wales than in 1916. France likewise made strenuous efforts to extend its food production in 1918, but by reason of its reduced man power had about reached its maximum. While the wheat crop was larger and of better quality than in the preceding year, production had dwindled with the continuance of the war and even with the 1918 increase was much below the normal for that country. The potato situation was particularly grave, the crop being not over two-thirds of the ten-year average.

A systematic campaign like that of the previous year was prosecuted in the United States in the fall of 1918, with the objective of a great liberty wheat harvest for 1919. The response was an acreage 13,000,000 acres greater than any previously recorded. Although the season was not favorable for the spring-sown crop, wheat production amounted to 941,000,000 bushels, considerably in advance of the 1918 crop and the second largest in history. The total area sown to leading cereals in the crop of 1919 was 33,000,000 acres greater than the pre-war average for 1910-14 and produced 635,000,000 bushels more than that average. At prevailing prices the value of all crops in the United States in 1919 was estimated at \$15,873,000,000, compared with the pre-war average of \$5,827,000,000. This was due in part to the higher prices but also represented the increased response to the appeal for food. The world crops as estimated by the International Institute of Agriculture, while large, were not over 70 per cent of food requirements in the European countries. There was a decided decrease in the area devoted to cereals

and potatoes in Great Britain, with a consequent decrease in production. There were corresponding decreases in livestock, with a disquieting prospect for milk and a falling off of young stock and sheep. The Armistice, therefore, found Europe largely dependent on imported food, with enormously increased demand. The large part which agriculture had had in determining the result of the war was everywhere conceded, and in Great Britain especially a more definite and favorable agricultural policy promised, with the appointment of a Royal Commission under the Ministry of Reconstruction.

Agriculture Following the War. After the Armistice the United States Department of Agriculture, realizing the possible dangers of overproduction as a result of the opening up of the channels of trade and the resumption of farming in Europe, recommended a reduction in the wheat area of about 15 per cent and advised safe farming. The season was unfavorable, the labor shortage continued, amounting to approximately 37 per cent, and wages rose to an appalling point. This, with the continued high cost of fertilizers, machinery and supplies, all of which had greatly increased since 1914, made the hazard unusually large. Altogether the American farmers had to meet the most difficult situation in 1920 they had ever experienced. In spite of this the harvest was the largest of record, with a single exception. It met a falling market, however, in the late summer and autumn, with the worst slump in the history of grain prices. This threw the farmers and the banks supporting them into panic and resulted in the most severe agricultural depression the country had ever known. While Europe was still in need of outside food, difficulties of transportation, unfavorable exchange, and inability of the countries to buy worked against export. Moreover, Canada and British India, two prominent exporting countries, had a combined wheat crop 195,000,000 bushels greater than in 1919.

While agriculture shared a general business depression in America, no other industry was affected so soon or so seriously. Farmers had not been allowed to profit by the war emergency as other industries had. Prices had been held down by price limitation of the Food Administration and by agreement. Farmers had produced their crops at maximum costs, and the inflation in land prices had necessitated many buyers' executing heavy mortgages. Agriculture was one of the very first industries to be affected by deflation, which in its case was sudden and precipitate, not gradual and regulated as in most other industries. The unusually heavy harvest of 1920, produced at maximum costs, was worth \$3,000,000,000 less than the smaller crop of 1919. Live stock and its products likewise declined to an extent causing serious loss to producers. The total value of animal products in 1920 was about \$200,000,000 less than in 1919.

Congress, called upon for relief, revived the War Finance Corporation to aid local banks in carrying farmers and marketing crops, and passed an emergency tariff favorable to agriculture. Price conditions continued in 1921, with production far in excess of domestic needs, high freight rates, inability of Europe to buy, and general business depression. Wheat fell below \$1 a bushel, with its purchasing power less than the low price of 49 cents in 1894. Corn on the farms of the corn belt was lower than for 25 years. It was estimated that one-fourth

of the farmers of the country were facing bankruptcy or had been wiped out. Similarly land rents, which had doubled, trebled, and increased even more in the prosperous years of the war, caused many renters to lose not only their labor but their savings. The purchasing power of the principal farm crops became lower than ever before, and that of the major grain crops was little more than half the average for the five pre-war years. The farmers' wages were reduced to about the pre-war level, while the wages of workers in other lines remained near the war level. At the close of the year the cost of getting farm products to market frequently exceeded the amount the farmer himself received in return. The situation attracted such attention that Congress appointed a Joint Congressional Commission of Agricultural Inquiry, which in the winter of 1921-22 made a series of illuminating reports, and urged the necessity for the formulation of a definite programme looking to the permanent development of agriculture, with a view to relating it to the various agencies of distribution in such a way as to avoid duplication, waste, and loss in reaching the consumer.

The severe agricultural depression continued in 1922 with little abatement, while the cumulative effect noticeably increased and there was great discouragement on the part of the farming people. In most farming States taxes on farms had more than doubled since before the War. In the Central Western States these absorbed one-third of the farm income, as compared with less than one-tenth in 1913. Early in the year President Harding called a National Agricultural Conference at Washington, the first of the kind ever held in this country, with representatives from the principal farm organizations, agricultural institutions, and various lines of industry directly related to agriculture. This gave opportunity for a broadminded consideration of the situation and the outlining of remedial measures. The recommendations and the measures urged were notable for their sound constructive character. Favorable action was taken on many of them. The revival of the War Finance Corporation, making available more than \$350,000,000 for agricultural financing, saved thousands of farmers from bankruptcy and many banks in the agricultural regions from passing into the hands of receivers, besides restoring confidence and having a salient effect upon interest rates. The provision for greatly increased mortgage loans by the farm land banks and joint stock land banks enabled farmers in large numbers to refund their obligations and place them on a deferred payment basis. Unusual attention was given to aiding the marketing of farm products. A tariff law more favorable to agriculture was enacted; the Packers and Stockyards Act placed all packing houses, stockyards, and similar agencies under government supervision, giving assurance of open competitive conditions; and an act was passed extending government supervision over grain exchanges dealing in futures, in the effort to control another practice believed to be disadvantageous to agriculture. During this period the Farm Bloc in Congress became active and a source of great power, overriding party lines and giving the farmers' interest unprecedented force.

Although there were some marks of improvement in 1923 over the three previous years, the wheat situation became even worse, and it was only by comparison that the situation as a whole

appeared better. The 1923 wheat crop, nearly three-fourths as large as that of 1919, had a value of only \$726,000,000, compared with \$2,080,000,000 in 1919. The aggregate value of crops and live stock products, however, was estimated at \$12,204,000,000, nearly a billion more than in 1922. It was also greater than in 1921 or for any year prior to 1917. The index of the purchasing power of farm crops as a group was 75 as compared with 64 in 1922. Many farmers, however, had been reduced to the breaking point by the low price of wheat and the shrinkage in value of range cattle. Thousands went bankrupt and many more were impoverished. Statistics of fifteen wheat and corn producing States showed that 9.5 per cent of the farmers had lost their farms, while an additional 15 per cent were saved only by the leniency of their creditors. These continued four years of distress resulted in increasing unrest and dissatisfaction over the whole country and a drift to the towns and cities. Of the many remedies suggested and pressed with vigor, a common one was the guarantee of prices for wheat, which did not find favor. The country banks of the Northwest were given support by the banking interests of the country, but proposals for a \$50,000,000 loan to farmers of the Northwest to enable greater diversification was defeated in Congress after much agitation. The President raised the tariff on wheat 12 cents a bushel, bringing it up to 42 cents, to meet the competition of Canada. It was made clear, however, that the United States could not successfully compete with Canada in wheat selling in European markets, owing to cheaper production and more advantageous shipping facilities.

The wheat acreage declined from the peak of 75,000,000 acres in 1919 to 58,000,000 acres in 1923, only 11,000,000 acres above the pre-war average. The area sown in the fall of 1923 indicated a further decline of some 6,000,000 acres, which was still regarded as in excess of domestic needs. The unfavorable exchange and diminished ability of Europe to buy, taken in connection with the competition of other countries for the European market, emphasized the need of readjustment. The exports of wheat fell off from upwards of 293,000,000 bushels in 1921 and 208,000,000 bushels in 1922 to a little less than 155,000,000 bushels in 1923. There was also a considerable decline in exports of flour. Statistics collected by the U. S. Department of Agriculture in 1922 from over the country showed the average cost of producing a bushel of wheat to be \$1.23, while the average price received by farmers was \$1.11, and of oats 53 cents as compared with 48 cents.

While there was great revival of agricultural production in the countries of Europe, farming was in an abnormal condition in several localities and suffered depression. The wheat growers of Australia had had their market cut off by shortage of tonnage and wheat was accumulating in large quantities. The Government afforded relief by guaranteeing \$1 a bushel, later prepared for bulk storage and shipment, and administered the elevator system. Arrangements were made to finance the wheat pool, the Government advancing farmers three shillings per bushel f.o.b. Aid was also extended to the pastoral industry by a subsidy of $\frac{1}{4}$ d. a pound on beef. The Argentine live stock industry was reported in the most serious condition in its history, due to the slump in foreign demand, depreciation in the

value of grazing lands and threatened loss of herds through insufficient pasturage. South Africa, faced with a large cattle surplus and very low prices, had a government-provided bounty equivalent to one cent per pound on exported beef and \$.005 on live stock.

The cultivated area in Great Britain began to decline almost immediately after the War. Landowners, who had suffered severely during the War and were not permitted to raise rents although taxes went up, were under greater obligation to handle their land productively. Demands from tenants increased. Labor became scarce and wages advanced. Many large estates were broken up and sold. It was repeatedly urged from the lesson of the War that the use to which land was put was not a private concern of owners and occupiers, but had become a matter of vital interest to the nation. However, the recommendations of the Royal Commission were not enacted into law, and the essential features of a compromise passed in 1920, continuing a portion of the Corn Production Act and otherwise providing for greater security in arable farming, were repealed the following year, causing great disappointment and sharp criticism. In 1920 the acreage under wheat in England and Wales was only 70,000 acres more than in 1914, with an equal falling off in oats. In ten years the urban population had increased about 2,000,000, while rural districts declined about 50,000. The last payments under the guaranteed minimum grain prices, originated in 1917, were made in 1922. The maintenance of this guarantee during six years cost the country approximately £14,000,000. The plight of British farmers in 1923 was well-nigh desperate. In that year 400,000 acres of plowed land were laid down in grass. The wartime increase in cultivated acreage disappeared, and wages of agricultural labor became so low as to afford only the scantiest livelihood. Despite this, the net returns on large estates was only about 1 per cent. The depression was fast approaching that of the 80's. There was strong opposition to protective tariff, because of the large amount of unemployment in the industries and the demand for cheap food. An Agricultural Tribunal made a further report with recommendations, and finally, near the close of the year, an agricultural subsidy of £1 an acre was provided on arable land, including market gardens, fruit, and hops, contingent on the farmers' paying labor a wage of not less than 30 shillings a week. An Agricultural Credits Act was passed, and a reduction was effected in freight rates.

France recovered quite rapidly after the War. In less than two years after the Armistice nearly 50 per cent of the devastated land had been cleared and put under cultivation, and in a short time practically the entire area had been restored. Early assistance given farmers in that area was extended to those who wished to acquire farm land to replace that too seriously damaged for occupancy. By 1923 reconstruction had reached a point where wheat production was about 90 per cent of the pre-war figure. French millers were still required to mill closely and to incorporate from 8 to 10 per cent of substitutes in flour. As in several other European countries, rural depopulation became something of a problem. Many farmers and laborers were attracted to the towns by higher wages. Devastated lands in the Belgian war zone

were taken over by the government, restored and turned back to the original owners in good condition, with payment of 5 per cent interest on pre-war value while in government hands. Italy continued for several years to fix the price for wheat, and paid premiums for grain produced in the southern provinces or wheat produced in excess of that raised in 1918, the effort being to minimize importation.

Production in Germany recovered quite rapidly, but agricultural labor became a problem and live stock numbers were short. Farmers were slow to accept the Government Food Commission price for grain, and there was conflict of interest between city and rural population. Consequently food shortage continued into 1924. The three main aspects in connection with this were (1) the breakdown in currency, causing a collapse of distribution, (2) inability of merchants to finance the full annual margin of imports necessary to make up the usual deficit in domestic production, and (3) widespread unemployment, as a result of which millions of workers in urban and manufacturing districts were unable to purchase sufficient food, even if it were in the market. Russian agriculture recovered slowly, owing to the disorganized condition of the country and the indefinite land policy which contributed to distrust and uncertainty. Crop production in lines in which the country was formerly a leader and a large exporter decreased tremendously, while in many sections famine conditions prevailed. By 1923 the grain area was reported at about 80 per cent of the pre-war figures for the present Russian territory, but only small quantities were available for export. Besides the local confiscation of the land in Soviet Russia, there were various measures for breaking up large estates in Germany, Austria, Hungary, Poland, Rumania, and Czechoslovakia.

Census of Agriculture. The census of 1920 showed a total farm area in the United States of 955,883,715 acres, as compared with 878,798,325 acres in 1910, an increase of 8.8 per cent. There were 503,073,007 acres of improved land in farms in 1920, as compared with 478,451,750 acres in 1910, an increase of 5.1 per cent. The increase in total acreage was therefore somewhat larger than in improved farm land. There was a decrease of 12 per cent in farm woodland. The total number of farms in 1920 was 6,448,343, an increase of 1.4 per cent in the decade. The average size of the farms was 148.2 acres, of which 78 acres were improved land, a small increase in each case over 1910. The aggregate value of all farm property in 1920 was reported as \$77,924,100,338, representing an increase of over 90 per cent in the decade. This large increase, however, was less than that between 1900 and 1910, which amounted to over 100 per cent. The chief increase was in land, which rose from \$34,801,125,697 in 1910 to \$66,334,309,556 in 1920, the average value per acre being \$32.40 in 1910 and \$57.36 in 1920.

For the first time in the country's history the urban population exceeded that in rural territory, and the growth of the former had been at a considerably more rapid rate; i.e. over 12,000,000 in urban and only a million and a half in rural territory. Thus, while the increase in total population was nearly 15 per cent during the decade and the growth in urban population was 28.8 per cent, the increase in rural territory was only 3.2 per cent, and in the purely

country districts an actual decrease of over a quarter of a million was recorded. This change in the trend of population from the country to town and city caused no little comment. Agriculture was not keeping up with the growth of total population, considered from the standpoint of rural population, number of farms or acreage of improved land in farms. It was calculated that more than 4,000,000 people were diverted from agriculture to other industries in the growth of the 20-year period, 1900-20. This drift from the farms to the cities, due to larger urban opportunities, continued through the years of severe agricultural depression, 1920-23. It was estimated that fully a million more persons had moved from the land. This change could hardly fail to affect production, even with the increased efficiency of the American farmer. The peak of production per capita of inhabitants was reached about 1906 or 1907, and although the decrease since then had been slow it bade fair to be more evident with the shift of rural population. Meanwhile, for the first time in history the value of imports of agricultural products into the United States exceeded the value of exports. These imports consisted mainly of tea, coffee, sugar, tropical fruits, and nuts. In the fiscal year 1923 these imports, including forest products, were valued at \$2,135,000,000 compared with exports valued at \$1,927,000,000. This adverse showing was in part due to the low prices of export products and the high prices of imports.

Position of the United States in World Agriculture. Of the four countries which have stood preëminent in agricultural production, i.e. the United States, Russia, China, and India, the United States was the only one producing a surplus for export. It is the largest producer of corn, it is much the largest wheat producing country of the world, and since the decline in Russia it leads in the other cereals except rye and rice. No other country approaches it in cotton or tobacco. Nearly 70 per cent of the world's crop of corn, 60 per cent of the cotton, 50 per cent of the tobacco, and approximately one-fourth of the total cereal supply is raised in the United States. This is done with the labor of about one-fourth of the gainfully employed population, whereas 85 per cent of the population of Russia has been classed as agricultural and three-fourths of the people of China and of India derive their support from agriculture. The large share of the world's staple crops contributed by the United States is grown with less than 4 per cent of the farmers and farm laborers of the world showing the high efficiency of the American farmer. The increase in productivity of the American farm is estimated at fully 15 per cent in the past decade. There has also been a very marked upward trend in yield per acre in recent years. The United States also leads all nations in exports of agricultural products. Since the war the value of its agricultural exports has exceeded that combined value of those from all other nations in the world, and yet these exports amount to only one-eighth of its production. Four countries now furnish about 90 per cent of the world's surplus of agricultural products, i.e. the United States, Canada, Argentina, and Australia, with the United States contributing approximately half. Its four great surplus agricultural products are cotton, wheat, corn, and hogs.

Farm Organization. The farming people

made remarkable efforts during the decade to protect their economic interests, promote their welfare and improve their general condition through organization. The American Farm Bureau Federation, formed by the federation of the State farm bureaus, based in turn on the County bureaus organized to promote extension work, became the largest and most powerful national organization, with a membership of approximately a million. Under its leadership various coöperative ventures were launched and agricultural legislation promoted. The period of depression stimulated efforts toward organization, especially for the purpose of coöperation in buying and selling products. The United States Census reported that in 1919 more than 1,000,000 farmers marketed coöperatively products valued at \$722,000,000, while supplies to the value of \$84,000,000 were purchased through coöperative buying associations. Grain, milk, cream, butter, fruit, and truck crops were the most prominent products handled by marketing associations. Organization later spread to other branches, notably cotton and tobacco, for which large marketing organizations were formed. According to the Department of Agriculture more than \$2,000,000,000 of business was done by farmer organizations in 1923, a large percentage of it in selling farm products. Grain organizations did a total business of \$490,000,000, dairy organizations \$300,000,000, live stock shipping associations \$220,000,000, fruit and vegetable associations \$280,000,000, cotton coöperatives \$100,000,000, and tobacco organizations \$132,000,000. It was estimated that 10,000 coöperative organizations were in operation.

Many failures of coöperative enterprises have been traced to such causes as falling prices, inadequate financing, poor management, and too small volume of business in proportion to the overhead. Study has developed the essentials of successful organization and coöperation and is aiding the movement greatly. Many obstacles have been placed in the way of such organization because of its interference with existing business methods, and it was much hampered by prosecutions under the Sherman Law, but its legality was assured by an act in 1922 specifically recognizing the right of farmers to associate for purposes of marketing their products. In Great Britain the Ministry of Agriculture has stimulated coöperative societies for the marketing of products by the offer of loans to assist in financing their operation.

Standardization of Farm Products. Coöperative marketing, selling by contract, and warehousing have been greatly promoted through the establishment of Federal standards for agricultural products. Such standards, authorized by Congress, include cereals, cotton, hay, tobacco, and live stock, wool, and many of the most important fruits and vegetables. The cotton standards have been adopted by the leading cotton exchanges of Europe for American cotton. The warehouse act, stabilizing the receipts for products stored in licensed warehouses, necessitated such standards, as did also the inauguration by the Department of Agriculture of ship-point inspection of fruits and vegetables. Great benefit has been derived from this system of standards, although in their making they have been subject to sharp criticism. Their use has done away with many of the controversies between shipper and buyer which formerly arose,

PRODUCTION BY COUNTRIES IN 1922 AND 1923 OF WHEAT, RYE, OATS, BARLEY AND MAIZE IN BUSHELS AND OF COTTON IN BALES

Production by Countries. See accompanying table on p 43.

New Literature. The following may be noted among the more important of the recent books on Agriculture and Agricultural Subjects: L. H. Bailey, *Cyclopædia of Farm Crops* (New York, 1922); *Cyclopædia of Farm Animals* (New York, 1922); H. J. Waters, *The Essentials of Agriculture* (Boston and London, 1915); A. H. H. Matthews, *Fifty Years of Agricultural Politics, 1865-1915* (London, 1915); A. D. Hall, *Agriculture After the War* (Oxford, 1916); B. H. Hibbard, *Effects of the Great War upon Agriculture in the United States and Great Britain* (Washington, 1919); H. C. Taylor, *Agricultural Economics* (New York and London, 1919); J. M. Gillette, *Constructive Rural Sociology* (New York, 1916); J. E. Boyle, *Agricultural Economics* (Philadelphia and London, 1921); C. S. Duncan, *Marketing, Its Problems and Methods* (New York and London, 1920); O. B. Jesness, *The Coöperative Marketing of Farm Products* (Philadelphia and London, 1923); Helen Douglas Irvine, *The Making of Rural Europe* (London, 1923); H. L. Shantz and C. F. Marbut, *The Vegetation and Soils of America* (New York, 1923); L. Carrier, *The Beginnings of Agriculture in America* (New York, 1923); J. Shaefer, *The History of Agriculture in Wisconsin* (State Historical Society, Madison, 1922); G. F. Warren, *Prices of Farm Products in the United States* (United States Department of Agriculture, Bulletin 999, 1921); G. F. Warren, *Prices of Farm Products in New York* (covering 132 years) (New York, Cornell Experiment Station, Bulletin 416, 1923); J. T. Stewart, *Engineering on the Farm* (Chicago, 1923). See AGRICULTURAL EDUCATION.

AGRICULTURE, INTERNATIONAL INSTITUTE OF. The Institute, located at Rome, Italy, numbered 64 nations as adhering members in 1924. The United States had a larger number of votes than any other nation. The Institute continued its work with difficulty during the War, but maintained its organization and has since made notable progress. David Lubin, its originator and for many years the United States representative, died early in 1919. English has been added to French as one of the official languages of the Institute. The reporting service to the United States was greatly improved. The condition and estimates for important crops and live stock from the various countries reporting were cabled promptly. This information is broadcasted from the United States Department of Agriculture by radio, telegraph, and press release, so that the farmer may have the information as soon as the trader. This has gone a long way toward realizing the underlying purpose of its founders.

AGRICULTURE, UNITED STATES DEPARTMENT OF. This Department, established as a separate branch of the Government in 1862, has grown to be one of the large central agencies, working not only for the interests of the agricultural industry, but for those of the public welfare generally. The range of its service extends from food production and health to weather prediction, means of communication, and education. The chief functions of the Department may be classed as administration, service including information, regulation relating to the carrying out of various laws, and

research. In recent years the variety of its activities has been greatly enlarged and its work extended. It conducts research and inquiry in nearly every phase of crop and live stock production and distribution, is carrying out a systematic soil survey, and is actively studying the broad economic problems in the field of agriculture. It is supervising the greatest road building programme ever undertaken in history, by far the most extensive system for aiding farmers and their families directly through agricultural extension, and a nationwide system of agricultural experiment stations. It also is administering the National Forests, comprising upwards of 157,000,000 acres of land, and it is enforcing more than 30 regulatory laws for the health, safety, and general welfare of the public. Among the latter may be mentioned those relating to the inspection of foods and drugs, the inspection of live stock and their products after slaughter for food consumption, import and export of animals and control of interstate movement; laws regulating the importation of foreign birds and animals, interstate trade in game and protection of migratory and insectivorous birds, the inspection and quarantine of diseased or infested plants, road construction in cooperation with the States, cotton and grain standards, trade in grain futures, Federal licensing of warehouses, and control of stockyards and packing-houses.

Edwin T. Meredith of Iowa succeeded David F. Houston as Secretary of Agriculture in February, 1920, and in turn was succeeded by Henry C. Wallace of Iowa on March 4, 1921. In addition to the Secretary, there is one Assistant Secretary, and Directors of Scientific Work, Regulatory Work, and Extension, respectively. The organization includes the Weather Bureau, the Forest Service, the Bureaus of Animal Industry, Plant Industry, Chemistry, Soils, Entomology, Biological Survey, Public Roads, Agricultural Economics, and Home Economics; the Office of Experiment Stations, Agricultural Extension Service, fixed Nitrogen Research Laboratory, Library, and several smaller units. The Bureau of Home Economics was established as a separate unit July 1, 1923.

The personnel of the Department numbered more than 20,000 persons in 1924. Its funds for the fiscal year ended June 30, 1924, aggregated \$69,536,653, including \$32,300,000 for road building. In 1923 the Department issued over 1500 separate publications, about half of which were new, the remainder being reprints. The total number of copies issued was about 30,000,000. Included in these publications were periodicals entitled *Journal of Agricultural Research*, *Monthly Weather Review*, *Experiment Station Record*, *Crops and Markets*, and *The Official Record*, a house organ; upwards of 600 *Farmers' Bulletins*, an *Annual Report* of the Secretary, and the *Yearbook*. In addition to the above a large number of articles were prepared for publication outside, in trade, scientific, and popular periodicals. The Department has an extensive and varied correspondence, and maintains a press service for the dissemination of matter of immediate interest.

AHERN, MARY EILEEN (?-). An American librarian and organizer, born near Indianapolis, Ind., and educated at the Spencer (Ind.) High School, the Central Normal College of Indiana, and the Library School of the Armour Institute of Technology, Chicago. After beginning

her career as a public school teacher in Indiana, she held the offices of Assistant State Librarian of Indiana (1889-93) and of State Librarian (1893-5). In 1889 she organized the Indiana Library Association and was its secretary from 1889-96. She was organizer (1896) and secretary (1896-1907) of the library department of the National Education Association. In 1919 she was publicity agent of the American Library Association in France. She has lectured in schools and before clubs, and since 1896 she has been editor of *Public Libraries*. She is a contributor to library and educational journals.

AHMED FUAD PASHA. See **FUAD I.**

AHMED MIRZA (1898-). A Shah of Persia (see **VOL. I**). He was crowned in 1914, but the government of Persia was under the control of the cabinet, whose most powerful member was Reza Khan (q.v.).

AICARD, JEAN (1848-1921), French poet and novelist (see **VOL. I**). After 1914 he published several volumes of war poetry and two novels, *Ariette des Mayons* (1917) and *Gaspard de Besse* (1919). The last named work, in two volumes (*Gaspard de Besse, Raconté aux Poilus de France*, and *Gaspard de Besse, ses Dernières Aventures*) portrays a sort of Provençal Robin Hood, a man of the people who takes a truly Gallic pleasure in life and leads an existence which is care-free if hardly virtuous. He died in Paris, May 13, 1921.

AIKEN, CONRAD (POTTER). (1889-). American poet, born at Savannah, Ga., and educated at Harvard. After the appearance of his first volume, *Earth Triumphant and Other Tales* (1914), he became an important figure in the American poetical renaissance of the decade 1914-24, producing almost a dozen works in that period. Always an individualist, in his poetry, Mr. Aiken followed no contemporary beaten track. His work possesses a metaphysical quality, concerning itself with the consciousness of man rather than with the external world, and for this reason his manner is often obscure. Yet he has written poetry rich in color, varied in incident, and musical in technique and content, as in *Priapus and the Pool* (1921). Though the narrative poem is his favorite form, as in *The Jig of Forslin* (1916), *The House of Dust* (1920), and *Punch, The Immortal Liar* (1921), he has also written lyrics of a high order, particularly in *Turns and Movies* (1916). Mr. Aiken set forth his æsthetic credo lucidly and provocatively in a volume of critical essays, *Scepticisms* (1919). The title of this work and of two others, *Nocturne of Remembered Spring* (1917), and *The Charnel Rose* (1918), give something of the implications of his philosophical attitude. He has also written for *The Dial* short stories similar in manner and phrasing to his poetry. In 1923 he published *The Pilgrimage of Festus*, a narrative poem, which he called "a cerebral adventure."

AIKINS, SIR JAMES (ALBERT MANNING) (1851-). Canadian lawyer and administrator, born in the County of Peel, Upper Canada. He was educated at Upper Canada College and the University of Toronto. He was a member of Parliament from Brandon, Canada, 1911-15. As director of the Imperial Bank of Canada he took a prominent part in the financial affairs of the Dominion. He was counsel of the Canadian Pacific Railway Company at Winnipeg, 1881-1911; president of the Canadian Bar Association, 1914-21; president of the Confer-

ence of Commissioners on Uniformity of Laws and later Lieutenant-Governor of Manitoba. From 1887 to 1916 he was Honorary Bursar and Member of Council, University of Winnipeg, and later Honorary Lieutenant-Colonel of the 90th Regiment Winnipeg Rifles and Honorary Colonel of the 99th Regiment Manitoba Rangers.

AINSWORTH, WILLIAM NEWMAN (1872-). An American Methodist Episcopal bishop, born at Camilla, Ga., and educated at Emory College, Ga. He was ordained in the ministry of the Methodist Episcopal Church of the South in 1891 and served as pastor in various churches in the South until 1909, when he became president of Wesleyan Female College, Macon, Ga., for three years. He took up his duties again as pastor in 1913 and was elected bishop in 1918.

AISHTON, RICHARD HENRY (1860-). An American railway official, born at Evanston, Ill., and educated in the public schools. He entered the railroad service in 1878 as axman in the engineering corps of the Chicago and Northwestern Railway. After holding various other positions in the same company, he became assistant superintendent in 1895, superintendent in 1897, general superintendent in 1899, assistant general manager in 1902, and general manager of lines east of the Missouri in 1906. This last position he held until 1910. From 1910 to 1914 he was vice-president in charge of operation and maintenance, and from 1916 to 1920, president. He was director of the Western Division of Railways under the United States government from 1918 to 1920. In the latter year he became president of the American Railway Association.

AISNE, BATTLES OF THE. See **WAR IN EUROPE, Western Front.**

AITCHISON, CLYDE B. (1875-). An Interstate Commerce Commissioner. He was born at Clinton, Iowa, and educated at Hastings College (Nebraska) and the University of Oregon. He was admitted to the bar in 1896, and to the Supreme Court of the United States in 1908. From 1896 to 1903 he practiced in Iowa, going to Portland, Ore., in the latter year. In 1905-6 he was secretary of the commission to revise tax and revenue laws in Oregon. From 1907 to 1916 he was a member of the Railroad Commission of Oregon and of its successor, the Public Service Commission. He was solicitor for the National Association of Railway Commissioners in 1916-17; in the latter year he became a member of the Interstate Commerce Commission and served as chairman, 1919-20. He is author of *An Annotation of Iowa Decisions* (1902).

AITCHISON, JOHN YOUNG (1868-1926). An American Baptist clergyman, born at Cascade, Iowa, and educated at Central College, Pella, Iowa, Des Moines College, and the Divinity School of the University of Chicago. He was

ordained in the Baptist ministry in 1896 and held various pastorates in the Middle West from 1894 to 1909. He was secretary of the American Baptist Home Missionary Society of Chicago, 1912-16, and home secretary of the American Baptist Foreign Missionary Society from 1916-19. In 1919 he became director general of the Board of Promotion of the Northern Baptist Convention, which proposed to raise \$100,000,000 to advance the work of the church.

AITKEN, ROBERT INGERSOLL (1878-). An American sculptor (see VOL I). In 1915 he received the medal of honor of the Architectural League of New York for sculpture and the silver medal for sculpture at the Panama-Pacific International Exposition in the same year. He was commissioned captain in the United States army and assigned to Machine Gun Company, 306th Infantry. Since the War he has designed and executed a number of war memorials, chief of which is the one at Kansas City, Mo., in process of erection in 1924.

AKELEY, CARL ETHAN (1864-1926). An American inventor and taxidermist. He began his work with the Field Museum in Chicago in 1895 and with the American Museum of Natural History in New York City in 1909. During the War he served with the United States army as consulting engineer and also in the Emergency Fleet Corporation as special assistant in the concrete department. He invented the cement gun, the Akeley camera, etc. He studied big game in Africa, making several trips there for that purpose.

AKINS, ZOE (1886-). An American playwright and poet born at Humansville, Mo., and educated at home and in private schools. Beginning as a contributor to magazines, she attained considerable success as a playwright. Most of her plays have been very successfully produced. She published *A Book of First Poems* (London, 1912), and *Cake Upon the Waters*, a novel (1919), as well as short stories in popular magazines. Among her many dramatic works are *Papa* (1914); *The Magical City* (1916); *Déclassée*, produced in New York City in 1919 with Ethel Barrymore; *Foot-loose* (an adaptation), produced in New York City with Emily Stevens in 1920; *Daddy's Gone A-Hunting*, 1921, with Marjorie Rambeau; *The Varying Shore*, 1921, with Elsie Ferguson; *Greatness*, otherwise *The Texas Nightingale*, produced at the Empire Theatre in 1922, with Jobyna Howland; *A Royal Fandango* (1923), with Ethel Barrymore; *The Moon-Flowers* (1924), with Elsie Ferguson, and others.

AKRON. A manufacturing city of Ohio. The area increased from 7254 acres in 1915 to 16,120 acres in 1921; the population rose approximately 200 per cent, from 69,067 in 1910 to 208,435 in 1920. The city adopted a new charter of the commission manager type in 1920, but reverted to its old form in 1924. A city planning commission was appointed, and a comprehensive zoning ordinance was adopted, Aug 15, 1922. In 1915 a new municipal water system was established which represented an investment up to 1924 of about \$11,000,000. It included a reservoir in the Cuyahoga River with storage capacity of 2,385,200,000 gallons, a complete purification system, and a pumping station North Hill viaduct over the Cuyahoga River was opened in 1922. Elimination of the railroad grade crossings on the main lines of the Pennsylvania, Erie, and Baltimore and

Ohio Railroads through the city was started in 1924.

AKRON, MUNICIPAL UNIVERSITY OF. A coeducational institution at Akron, Ohio, founded in 1872 as Buchtel College, taken over by the city, and re-named in 1914. Buchtel College was retained as the name of the college of liberal arts of the university, which also comprised in 1924 a college of engineering, a school of home economics, and Teachers' College. The number of day students enrolled increased from 198 in 1914 to 878 in the year 1923-24, with 330 in the summer session of 1923; there were also 954 students in the night classes in 1923-24. The number of faculty members, including librarians and registrars, increased from 23 to 62 in the same period; the number of catalogued volumes in the library, exclusive of pamphlets and public documents, increased from 10,000 to 18,000; the productive funds from \$750,000 to \$975,000; and the total yearly income from \$115,000 to \$228,000. In 1920 bonds were issued to the amount of \$150,000 for the enlargement of the engineering laboratory, and in 1923 the alumni raised \$35,000 for the erection of a stadium seating 8000 persons. Teachers' College was erected in 1921 in coöperation with the Akron Board of Education. President, Parke Rexford Kolbe, Ph.D.

ALABAMA. The twenty-eighth of the United States in size (51,998 square miles) and the eighteenth in population; capital, Montgomery. The population increased from 2,138,093 in 1910 to 2,348,174 in 1920. The white population increased from 1,228,832 to 1,447,032; the Negro decreased from 908,282 to 900,652. The native white population rose from 1,209,876 to 1,429,370, while the relatively small foreign-born population decreased from 18,956 to 17,662. Both urban and rural populations mounted, the former from 370,431 to 509,317, the latter from 1,767,662 to 1,838,857. The populations of the largest cities increased thus: Birmingham (q.v.), from 132,685 to 178,806; Mobile, 51,521 to 60,777; Montgomery, 38,136 to 43,464.

Agriculture. In Alabama, as in the other cotton-producing States, agricultural conditions in the decade 1914-24 were affected greatly by the ravages of the cotton boll weevil, which became serious about 1912. In fact, cotton being the leading crop, the diminishing extent of cotton-raising was especially felt in this State. The boll weevil had spread through the cotton-growing area by 1915. Its effects were shown in both the production of cotton and the area devoted to it, the latter being reduced in the ten-year period about 1,000,000 acres, or nearly one-third, while the production declined about 400,000 bales, or about 35 per cent. The changed conditions are indicated by the fact that while cotton for many decades occupied from 36 to 38 per cent of all the cultivated land in Alabama, in 1920 it had dropped to 26.6 per cent. This condition led to the planting of other crops than cotton, the acreage of cereals increasing over 20 per cent and corn about 30 per cent in the decade. There was also a considerable increase in the growth of forage crops and in the raising of hogs and some other live stock.

While the population of the State increased 9.8 per cent during the decade 1910-20, the number of farms decreased 2.6 per cent, from 262,901 to 256,099, and the acreage from 20,732,312 to 19,576,856. There was, however, a slight increase in the improved land in farms,

which rose from 9,693,581 to 9,893,407 acres. The total value of farm property in the State apparently increased 86.6 per cent in the decade, or from \$370,138,429 in 1910 to \$690,848,720 in 1920; the average value per farm from \$1408 to \$2698. But it must be borne in mind in the statement of these values, and indeed in the statement of all comparative values of the decade 1914 to 1924, that the inflation of the currency in the latter part of that period is to be taken into account. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920.

The total percentage of land used for agricultural purposes in 1910 was 63.2, and in 1920, 59.7, a slight decrease. The percentage of improved farm land, however, increased from 46.8 to 50.5. Of the total of 256,099 farmers in 1920, 71,089 owned their farms, 741 were managers, and 148,269 were tenants. There was an increase in the decade of 4000 farmers and a decrease of 10,000 tenants. The white farmers in 1920 numbered 160,896, as compared with 152,258 in 1910, the colored farmers, 95,205 in 1920 and 110,443 in 1910. Of the white farmers 89,887 owned their farms, and of the colored farmers, 77,202. There was a decrease in the Negro population, 1910-20, of nearly 1 per cent, compared with an increase of nearly 10 per cent in the preceding decade, which noticeably affected the farm labor situation. The farms free from mortgage in 1920 were 64,498 and 74,504 in 1910. Those under mortgage numbered 27,854 in 1920, as compared with 27,457 in 1910. Live stock showed a considerable increase in the decade. In 1920 the total number of dairy cows was 491,163, as compared with 391,536 in 1910; swine, 1,496,893, as compared with 1,266,733. The number of sheep decreased from 109,112 to 81,968. The estimated production of the chief farm crops of 1923 was as follows: Corn, 48,108,000 bushels; oats, 4,971,000; potatoes, 3,931,000; sweet potatoes, 11,159,000; hay, 581,000 tons; cotton, 741,000 bales. Comparative figures for 1913 are as follows: Corn, 55,360,000 bushels; oats, 6,652,000 bushels; potatoes, 1,512,000 bushels; hay, 286,000 tons; cotton, 1,495,000 bales.

Mining. The important mineral products of Alabama are coal, iron ore, cement and clay products. In the decade 1914 to 1924 the mineral output remained fairly constant, although there was some fluctuation from year to year, and coal mining was hampered greatly by a protracted strike in 1921. The coal production in 1913 was 17,678,522 net tons. This fell to 15,593,422 net tons in 1914. In 1915 the output amounted to 14,927,937 net tons. In 1916 there was a considerable increase, the total coal mined in that year being 18,086,197. There was an increase of approximately 2,000,000 tons in 1917 and 1918. In 1919 the output fell again to 15,536,721 net tons. In 1920 the output remained about 16 million tons, fell to 12,570,000 tons in 1921, and in 1922 was 18,324,740 net tons. The production of iron ore in 1914 was 4,838,959 gross tons, compared with 5,215,740 tons in 1913. In 1915 the production was 5,309,354 tons, but in 1916 there was an increase of over 27 per cent, or a production of 6,747,900 tons. In 1917 there was a slight increase in value of shipments and in the quantity mined. The value of the shipments in 1918 was 14 per cent less than the previous year. There was a continued decrease in 1919, both in quantity

and in value. In 1920 the total production was 5,894,000 gross tons. In 1921 the production was 2,876,141 gross tons. In 1922 the shipments were 2,835,761 gross tons, valued at about \$5,000,000. In 1922 the production was increased to 5,234,568 gross tons. Alabama ranks third in the production of iron ore. The manufacture of coke is an important industry in the State. The production is between 3,000,000 and 5,000,000 net tons, but in 1921 it decreased sharply to 2,534,039. As a whole, the mineral production of the State increased from \$30,879,288 in 1914 to \$52,269,451 in 1921. The State ranked seventeenth in 1921 in the value of its mineral products. The census figures for 1919 show a total value of the products of all mines and quarries in the State as \$59,866,040, an increase of 145.8 per cent over the gross value reported in the census of 1909.

Manufactures. The industrial development of Alabama during the decade 1913-23 and especially in the latter part of that period was notable. The great undeveloped resources of the State were utilized by the government and by private corporations in the emergency resulting from the War. Great plate mills, costing over \$12,000,000 were constructed in Birmingham in 1917 by the Tennessee Coal, Iron and Railroad Company, and huge shipbuilding plants were erected by subsidiaries of the same company at Mobile. The Federal government undertook the development of the water power at Muscle Shoals, near Sheffield, chiefly for the purpose of recovering nitrogen from the air for the manufacture of explosives, and in October, 1917, the first atmospheric nitrogen was produced there. As development of the electric power there could not be completed in time to supply the electricity needed, it was necessary to erect a 50,000 horse power steam plant on the Warrior River, the current provided by which was carried to Muscle Shoals, a distance of nearly 100 miles, by transmission lines. The Federal Railroad Administration in 1919 decided to utilize the Warrior River for coal and iron traffic to the Gulf and Mobile, and purchased barges and equipment for the purpose. The utilization of the river for this purpose had been urged for many years, but private capital could not be induced to undertake it on a large scale. It was opened to navigation in 1920. River terminals were built at Shore Creek on the Warrior River to handle the traffic. Industrial progress in the State was hampered somewhat by coal mining strikes in 1919 and 1920. Another notable feature of water power development during 1920 was the joining of the Alabama power lines with those of Georgia, between Gaston, Ala., and Rome, Ga. By means of this connection Alabama water power is supplied for the mills of North and South Carolina during low water periods in those States, while when the rivers are low in Alabama, power from North and South Carolina is brought in. The manufacture of high grade phosphoric acid by the use of electric power was developed at Anniston in 1920. In the same year the shipbuilding plant at Mobile completed its fourteenth steel ship and ceased its war activities. In 1921 work undertaken to raise the height of the dams on the Warrior River to insure a depth of eight feet during the entire year, from Mobile to Birmingham, was completed. In the same year the Alabama Power Company began work which was finished in 1922 on its new dam

at Duncan's Riffle on the Coosa River, to develop 120,000 horse power, and also put into service another unit of the Lock 12 power plant on the Coosa River, adding 20,000 horse power.

The great power plant of Muscle Shoals was not completed by the government following the end of the War, and negotiations were carried on in 1922-3 for the purchase of this plant by Henry Ford. In September, 1923, the government granted the right to use a portion of this power to the Alabama Power Company. In October of 1923 work was resumed upon the construction of the dam across the Tennessee River on Muscle Shoals, but it was discontinued because of the lack of an appropriation by Congress.

The Fourteenth Census of Manufactures taken in 1919 indicated a vast increase in the industrial development of the State. The number of manufacturing establishments increased from 3242 in 1914 to 3654 in 1919; the number of persons engaged in manufacture from 89,053 to 120,889; the capital invested, from \$227,505,432 to \$455,592,733; and the value of products from \$178,797,633 to \$492,732,895. The chief manufacturing industries in 1919 were cotton goods, with a product valued at \$79,643,000; iron and steel works and rolling mills, \$64,980,000; iron and steel blast furnaces, \$57,018,000; and lumber and timber products, \$55,139,000. The chief manufacturing city in the State is Birmingham, which is one of the most important iron and steel manufacturing cities in the country. Mobile, during the War, was important as a shipbuilding centre. The steel ships manufactured, according to the census of 1919, amounted to \$15,909,618.

Education. Educational conditions in Alabama showed a marked improvement in the decade 1914-24, especially after 1918. A new school code was enacted by the Legislature in 1919, following a careful study of the school system of the State by representatives of the Federal Bureau of Education under the direction of the Alabama Education Commission. Considerable attention was devoted in the later years to vocational and exceptional education, the latter aimed especially at the removal of adult illiteracy. The enrollment in the elementary school grades in the decade remained practically constant. In 1913-14 the white enrollment in the elementary grades was 305,248; and in 1921, 358,743. In the elementary schools for Negroes the enrollment in 1913 was 146,602; in 1921, 164,340. According to statistics of the United States Bureau of Education, there was a total enrollment in the elementary and kindergarten schools of the State in 1919-20 of 543,507, and in the secondary schools, 35,433; or a total enrollment in that year of 569,940. The high school enrollment of white pupils increased from 15,094 in 1913 to 38,306 in 1921; Negro high school pupils, from 1210 to 1780.

Consolidation made considerable progress. In 1921 there were 245 consolidated school buildings in the State. Fourteen county training schools for Negro pupils are maintained, and summer schools for Negro teachers are conducted during the year. Illiteracy in the State showed a marked decrease from 26.2 per cent in 1910 to 20 per cent in 1920, among native whites, from 11.5 to 8.3, and among the Negroes, from 46.4 to 38.8.

Finance. For finance, see STATE FINANCES. **Political and Other Events.** During the

decade 1914-24 there was no change in the political complexion of State politics in Alabama. The State remained steadfastly Democratic. Oscar W. Underwood was elected United States Senator in 1914, to succeed Joseph F. Johnston, who died in 1913. At the same election Charles Henderson was chosen Governor of the State for four years. As a result of legislation previously passed, prohibition became effective in the State on July 1, but an attempt to place the woman suffrage amendment on the State Constitution was defeated in the Legislature. In the presidential election of 1916 President Wilson received a plurality of 68,969 votes. Only minor State officers and Congressmen were elected at this time. The State, during 1917, enjoyed remarkable industrial development, much of it traceable to the War. The quadrennial elections for governor and other State officers were held in 1918. Thomas E. Kilby was nominated for governor at the primaries and John H. Bankhead for the United States Senate. Both were elected with the entire Democratic ticket. Industrial prosperity continued during this year. The Legislature in 1919 refused to ratify the Federal woman suffrage amendment but approved the prohibition amendment on January 14. The only election held during 1919 was for Representative in Congress from the seventh district, following the death of Congressman John L. Burnett. C. B. Rainey was the successful candidate. In 1920 an extra session of the Legislature was called to pass measures putting into effect the Federal woman suffrage amendment. The same conditions which previously applied to male voters were expanded to include women, and in addition the Legislature submitted to the voters the amendment to the Constitution providing that in order to register a vote the elector must be of good character and must understand the duties and responsibilities of citizenship under our form of government. This amendment was designed to bar undesirable females of the Negro race from voting. Candidates for United States Senator were nominated at primaries held that year. Senator Underwood was a candidate for reelection. Senator Bankhead died on March 1, 1920, and it was necessary to elect a successor. Former Gov. B. B. Comer served as Senator by appointment from March to November. J. Thomas Heflin, member of Congress, received the nomination and both he and Senator Underwood were elected in November. In the presidential election of 1920 James M. Cox received 163,254 votes and Warren G. Harding 74,690. In 1920-21 a bitter coal miners' strike resulted in much harm to the industries of the State. There was much disorder, but the efforts of the miners to place the mines on a closed shop basis failed. The strike was settled on Feb. 22, 1921. The semi-centennial of Birmingham was celebrated in October, 1921, when President Harding was the guest of the city. At primary elections held in 1922, W. W. Brandon was nominated for governor and was elected in the November elections. During the summer of 1922 a railroad strike led to much violence, and the State troops were called into service. Governor Brandon assumed office the second Tuesday in January, 1923, and pledged himself to continue the programme of social reform in the State which had marked the administration of Governor Kilby. The term of the latter had been notable

for providing for the future abolition of the convict lease system, the building of new and improved prisons, enlarged schools and other reform measures. No elections were held in this year.

Legislation. The Legislature of Alabama meets every four years. A proposed amendment to make the session biennial was defeated in 1916. The Legislature in the same year passed six constitutional amendments relating chiefly to taxes and the banking system of the State. The Legislature of 1919 refused to ratify the woman suffrage amendment. The same Legislature passed a workmen's compensation law, an income tax law, which was later declared unconstitutional, and a measure penalizing combinations or agreements to strike. In the same year it adopted an eight-hour day and a forty-eight-hour week for children under 16 years in all gainful occupations. An elective workmen's compensation law was also enacted. The Legislature of 1923 deferred the effective date of the new law abolishing the convict leasing system for four years. Other measures passed were chiefly of local importance.

ALABAMA, UNIVERSITY OF. A State institution at Tuscaloosa, Ala., founded in 1831. The university increased greatly in size during the decade 1914-24. The number of students trebled both in the winter and the summer sessions, with an enrollment for the year 1923-24 of 2026 as against 652 in 1913, and an enrollment in the summer of 1923 of 2056 as against 562 in the summer of 1913. The faculty increased from 89 to 143, and the number of volumes in the library from 30,600 to more than 55,000. The endowment was raised from \$545,000 to \$1,208,000. President, George H. Denny, Ph D., LL.D.

ÅLAND ISLANDS. An archipelago made up of one large island and some 300 small ones at the entrance of the Gulf of Bothnia. Their inhabitants in 1920 numbered 26,911. From 1917 to 1921 the islands were the scene of unwonted turmoil. The work of the Russian Revolution of 1917 left its impress on the minds of the Ålanders, who, because they were bound to Sweden by ties of language, custom, and trade, proceeded to express their wish to be reunited to Sweden by a plebiscite in August, 1917. But the newly constituted state of Finland was opposed to the cession, offering as an alternative the establishment of local autonomy in the islands. It was plain, however, that Ålanders regarded union with Sweden as the only feasible plan. On the ground of self-determination they appealed to the Allied peoples in November, 1918. In February, 1919, their case was presented again before the Paris Peace Conference. But the Supreme Council denied its jurisdiction, so that in 1920 the dispute was placed before the League of Nations. A commission appointed to ascertain the state of opinion in Sweden, Finland, and the Åland Islands, reported back to the League Council in June, 1921. On June 24, the Council announced as its decision that the islands were to continue as a part of Finland but were to be neutralized with respect to military matters and also be guaranteed full local autonomy. Sweden protested but accepted the ruling, and the islands reverted to Finland.

ALASKA. The decade 1914-24 was marked by many important changes in Territorial affairs. From 1914 to 1918 Alaska suffered eco-

nomic and industrial depression incidental to the War, which materially reduced the population by drawing recruits for the army and navy and affected commerce. The census of January, 1920, numbered a population of 55,036, a decrease in ten years of 9320, of whom only one-fifth were natives. Considered generally, other discouraging conditions were few: reduction in mineral output, temporary diminution of commerce, and over-fishing of the salmon. Encouraging features were many: reorganization of government with a local legislature; enactment of progressive laws; increase of the fur-seal herds and renewal of the catch; utilization of forest resources; enlarged copper production; development of coal mines; improved roads; increase and scientific care of reindeer; land surveys; more productive farms; and especially the completion of the Alaska government railroad, extending from an ice-free port to the central mining districts of the Yukon watershed. Meanwhile education of whites and natives was widespread, and a College of Agriculture and Mining was established. The law-abiding natives improved their sanitation, built better houses and raised their standard of living. What was lacking was action by Congress, long urged and never granted, to coordinate Federal control and thus ensure future prosperity.

Population. The population decreased from 64,356 in 1910 to 55,036, one-fifth of whom were natives, in 1920. The loss of 1249 natives was due to epidemics of influenza. The great bulk of the decrease was due to enlistment in military service. During the last few years of the decade there was a steady and considerable increase of settlers.

Government. The governor, surveyor general, and judges of the four judicial districts are appointed by the President of the United States for four years. The Territory is represented in Congress by a Delegate, who has no vote. Under the Act of Congress of Aug. 24, 1912, its legislature, with limited powers, consists of a senate of eight members, two elected from each judicial district for four years, and a house of sixteen, elected likewise. Beginning in 1913, the legislature met biennially. Its laws are subject to veto by Congress. The divided and inefficient methods of Federal control of Alaskan affairs had long been recognized, but Congress for years failed to enact corrective legislation. When diminishing population, reduced mineral output, impaired transportation, and over-exploited fisheries brought matters to a crisis, Congress voted money for a government railway. Executive measures were finally taken to remedy business methods and save the situation. Upon the recommendation of a board of experts, the President authorized the creation of a permanent Inter-Departmental Commission on Alaska, with these functions: "To coordinate and bring together facts and suggestions touching matters affecting Alaska, and make recommendations for definite action . . . that duplication may be avoided and efficiency secured." As a result affairs under Federal control were being handled more efficiently in 1924. Congress remained silent, save in minor action on general land-leases, reindeer, and land-fur animals.

Local Legislation. The legislature met biennially from 1913 to 1923. None of its Acts was vetoed by Congress. Its legislation was along progressive lines; education was fostered, liquors and drugs prohibited, labor guarded as

to hours, safety, compensation and liens; road and fishery commission authorized, whereby co-operation with Federal bodies could be obtained; banks and corporations regulated, and the insane and indigent cared for.

Finances. The revenue is derived from license taxes, both Federal and Territorial. On Jan. 1, 1924, there was a balance in the treasury of \$218,345. The Federal taxes form the Alaskan Fund, of which 65 per cent is spent on roads, 25 on schools outside of incorporated towns, and 10 for relief of indigents by Federal judges. This fund received \$190,987 from licenses in 1923.

Banks. The 18 banks (3 of them national) had in 1923 a capital of \$780,000; surplus, \$607,000; and deposits, \$8,374,000.

Education. An Agricultural College and School of Mines was established. There are three classes of schools: within incorporated towns, without them, and native. In 1923 the 17 schools of the first class cost \$265,400 and had an enrollment of 2652. The 56 schools of the second class cost \$122,279, and had an enrollment of 1175 pupils. The native schools, constituting the third class, are maintained by the Federal government, under the Alaska Division of the Bureau of Education, and had an enrollment in 1923 of 4990.

Agriculture. The large areas of agricultural land in the interior valleys are being slowly occupied, as local needs make farming profitable. In the districts of Anchorage, Fairbanks and Matanuska there are 90 farms, where stock does well. The crops in order of value are barley, oats, spring wheat, winter rye, and winter wheat.

Forests and Parks. The important resources of the national forests, Tongass, 15,444,000 acres; and Chugach, 5,130,000 acres, amount to an estimated stand of 75,000,000,000 board feet. In 1923 there were cut for commercial use 31,000,000 board feet, besides large quantities free to settlers. Surveys were made at forty localities suitable for combined pulp mills and water power. Agricultural and mining lands have been largely segregated from forest areas. The administration of the national forests was improved and facilitated by the establishment of local headquarters at Juneau. See **FORESTRY**.

Commerce. Owing largely to War disturbances, Alaskan commercial shipments were seriously affected. From 1914 the volume of trade fell sharply but irregularly, with occasional increases, until 1922. The increase in 1923 over the previous year was approximately \$22,000,000, reaching a total, gold and silver shipments included, of \$83,000,000, of which \$53,000,000 was sent out from the Territory. Changes in prices in the later years somewhat affect the value of these data.

Natives. The Eskimo and Indian inhabitants were gradually taking more prominent parts in the activities of the Territory. This was especially true in southeastern Alaska, in the cannery settlements, and at other industrial centres. The efforts of the Alaska Division of the Bureau of Education to improve the condition of the natives was meeting with encouraging success. Under the direction of its agents, doctors, nurses, teachers, herders, etc., modern methods of sanitation, comfortable dwellings, more gardens, better schools, and higher standards generally had been promoted in many remote villages. Efficiency in industrial training was fol-

lowed by the organization of special settlements, entirely native, and the formation of cooperative associations, which were being successfully managed. Both the Metlakatla colony on Annette Island and the Indian town of Ilyadaburg were modern communities, with canneries, mills, electric power, cooperative associations, etc. Noorvik, on Kotzebue Sound near the Arctic Circle, had, with other modern plants, an electric lighting system. The natives in southeastern Alaska were taking important parts in the activities of that section, as clergymen, nurses, teachers, engineers, and navigators. In 1922 there were employed in the Alaskan salmon canneries 4192 natives. The life conditions of many Eskimos in remote regions, especially those located in the marshy, unhealthy deltas of the Yukon and Kuskokwim Rivers, were still distressing. Special efforts, with prospects of success, were being made to better them.

Fisheries. From year to year the fishery industry held its position as the most productive of the Territory. It will surprise many to learn that the aggregate value of fish caught exceeds by \$42,000,000 the entire mineral output of Alaska. The total value of fishery products to Jan. 1, 1924, was \$560,231,000. In its maximum year, 1918, the industry employed 31,213 persons, its investments in 1922 aggregated \$45,208,000. The value of the annual catch increased from \$15,739,000 in 1913 to \$59,844,850 in 1918. Decreases followed to \$24,087,000 in 1922, whence it rose yearly to about \$40,450,000 in 1923. The more important catches, in order of value, are salmon, herring, halibut, and cod. Far exceeding in importance other species, the salmon is the most valuable factor in Alaskan prosperity. The number of salmon caught and their value increased from 54,651,915 fish, \$19,564,381, in 1914, to 101,454,688 fish, \$53,464,812, in 1918. Of the salmon catch 95 per cent are canned. The great catch of 1918, which counted 6,505,535 cases, 48 eight-pound cans to a case, fell off alarmingly, 60 per cent, to 2,596,826 cases in 1921. There was an increase to 4,502,000 cases in 1922 and another unimportant increase in 1923. Although it was evident that commercial over-exploitation was destroying the salmon spawning grounds, endangering the food supplies of the natives, and ruining a most valuable national asset, Congress failed, despite urgent requests, to modify the old and inadequate law regarding Alaskan fisheries. The executive departments were obliged to adopt stringent measures, as far as the Federal laws permitted. By executive orders of the President in 1922, two fisheries reservations were created, the Alaskan Peninsula and the Southwestern. Under date of Oct. 25, 1923, regulations for fisheries on these and on the Aleutian reservations were issued. Fishing by the inhabitants is permitted for personal use, but corporations can only fish when licensed and under restrictions set forth in these rules. The herring industry was steadily expanding, due largely to the introduction of the Scotch method of curing pickled herring. The maximum value of \$2,320,116 came in 1922. Oversupply, storms, and decreased productivity of fishing grounds had reduced the halibut catch, which in 1922 amounted to 11,000,000 pounds, valued at \$1,035,000. Cod fell off in quantity and value from the maximum of 1918. The 6,135,000 pounds caught in 1922 had a value of \$464,169. A revival of the whale industry in

1922 resulted in the catch of 445 animals, valued at \$409,168. See FISHERIES

The fur-seal industry was formerly the most important in Alaska, but it had become far inferior to the fisheries and mines. The rookeries of the Pribilof Islands were estimated in 1867 to contain 4,000,000 seal. The herds were nearly exterminated by uncontrolled slaughter, and by pelagic hunting, so that by 1910 they contained only one-twentieth of the former number. By the treaty of 1912 between Great Britain, Japan, Russia, and the United States, pelagic sealing was made unlawful. Congress then enacted that the fur-seal industry should be a government monopoly, made the Pribilof Islands a closed reservation, to be governed by a commission of experts, and established a closed season so that the herds might recuperate. Under an excellent system of protection the herds were slowly but steadily increasing, their numbers rising from 294,687 in 1914 to 604,692 in 1923. During the decade the taking of seals was renewed, and about 30,000 animals were killed annually, the number varying from 25,318 in 1918 to 34,390 in 1919. The percentage of yearly increase was falling off, being in 1924 about 4.0 annually. The skins are sold at public auction, and the profits of the industry are in general \$1,000,000 a year above the cost of the service. Improved methods of taking pelts were adopted, and the fitting of the skins for the market, formerly done in England, became an American industry. The fur-seal industry gives employment to the 337 natives on the reservation.

From about 150,000 head in 1914, the reindeer increased to nearly 300,000, with a value of \$7,500,000. The enormous numbers, however, caused conflicts as to pasturage, introduced diseases and led to decadence, so that the Biological Survey had to be called upon for aid in locating suitable grazing areas, in combating diseases, and in improving herd management. Two-thirds of the deer were owned by the natives; the other third were being commercially exploited. The plan of introducing the meat of the reindeer to the markets of the Pacific Coast was successful, but its extent was strictly limited through lack of sufficient cold-storage plants on the commercial steamers. Originally introduced into the Bering Sea region, efforts were in progress in 1924 to distribute the reindeer so as to benefit the largest number of natives. Herds on the Aleutian and Pribilof Islands thrive, as also in the Matanuska Valley and in the Broad Pass region.

The destruction of the land game, which at one time was threatened, was stopped by means of closed seasons, game wardens, and custom inspections. The Bureau of Biological Survey had the matter in hand after the transfer of these duties to the Department of Agriculture, under the Act of Congress of May 31, 1920.

Minerals. The total mineral output to Jan. 1, 1924, amounted to \$518,000,000 distributed to include 1922 as follows: gold, \$335,526,000; copper, \$145,479,000; silver, \$8,834,000; coal, \$2,723,000; tin, \$938,000; lead, \$772,000; antimony, \$237,500; marble, petroleum, etc., \$3,476,000. Attaining an output of \$1,000,000 in 1892, it reached its maximum product of \$48,632,212 in 1916, and fell irregularly to \$17,000,000 in 1921. The estimated product for 1923 was \$19,000,000. For the decade the maximum annual output of gold was \$15,627,000 in 1916, after which it steadily decreased to \$6,150,000 in

1923. The decreases were primarily due to the increased cost of mining, while the value of gold remained almost unchanged. Placer mining was slowly passing as individual ventures, were replaced by dredges. The summer placer miners fell off from 4000 in 1913 to 410 in 1923. Quartz mines were increasing in number and average product. The large increase in silver values, rising from \$219,000 in 1913 to a maximum of \$1,039,000 in 1920 and only falling to \$600,000 in 1923, was due to its being almost entirely a by-product of gold and copper ores, though galena ore was being mined, in the Kantishna district.

Largely owing to the War, copper became the most valuable mineral of the Territory. In 1914, six mines produced 21,660,000 pounds, valued at \$2,852,934. Under pressure eighteen mines produced 119,655,000 pounds, worth \$29,484,291, in 1916. Although the output fell to 47,221,000 pounds in 1919, it rose to 86,000,000 in 1923. Most of the copper came from the Kennecott group and the Beatson-Bonanza mines, though some was mined at the Rush and Brown mine. From 28 tons in 1914, the production of lead exceeded 800 tons in three separate years. The maximum value was \$146,584, in 1917. The product in 1923 was worth \$60,000. Low prices had practically closed tin mines in Alaska.

Stimulated by the needs of the Alaska railroad under construction and operation, there were largely increased outputs of coal from mines along the line of the road. The product was almost entirely subbituminous and lignitic coal. The output rose from 1400 tons in 1914 to 100,000 tons in 1923. Despite constant efforts to uncover workable veins of high-grade coal in the Matanuska and the Bering River fields, no deposits of such fuels as can be profitably exported were discovered. Enormous reserves of low-grade bituminous and lignitic coal were located in various parts of the Territory, much of it easily accessible and cheaply mined. In 1922 more than 40 per cent of the coal burned in Alaska was imported. Up to 1924 the only oil produced was from the private wells in the Katalla field, which was barely sufficient to meet the local demands for gasoline. In 1922 there were imported into Alaska more than 19,000,000 gallons of oil of various kinds. Restrictions of Federal laws made impracticable the economical exploitation of petroleum fields. Under a later law, two companies began drilling in 1923 on the Alaskan Peninsula, but no success had been reported up to July, 1924. The Arctic Coast near Point Barrow was thought to be a promising field for oil, judging from seepages there observed. At the request and expense of the Navy Department experts of the Geological Survey were making an exhaustive examination of the adjacent region.

Transportation. The most important improvement in transportation was the construction by the United States of the Alaska Railroad, 543 miles in length, connecting the ice-free port of Seward with Fairbanks, the centre of the Tanana mining district. Apart from the main line the system had the following branches: Happy-Chatinka, 32 miles; Matanuska-Chickaloon, 45 miles; Healy coal mines, 4 miles. In January, 1924, there was a semiweekly train service to and from Fairbanks, which involved two days' travel with a lay-over at Curry. The Alaska Railroad serves directly the mines of the Kenai, Susitna, Matanuska, and central Yukon

districts. Traversing a rich coal region, it becomes the main source of fuel for the mines of the vast interior regions. It had already developed new mining grounds and brought farming settlers into the contiguous regions. The expenditures for the railroad amounted, up to June 30, 1923, to \$56,000,000, including systems purchased, roads built and reconstructed, and operation. As the total revenue from the road during 1923 was only \$543,521, it was evident that several years must elapse before the system became self-supporting. To replace the discontinued commercial transportation on the interior rivers, the railroad met the needs of the settlements of the lower Yukon by the establishment of a summer line of steamboats between Fairbanks and Holy Cross, where connection was made for the Norton Sound region with the launches of the Northern Commercial Company. Canadian boats in 1924 were caring for the settlers of the upper Yukon, while bringing ore to Fairbanks from the Klondike region. There had been constructed 6854 miles of roads and trails up to June 30, 1923, toward which the Federal government appropriated \$4,300,000. The main road of 410 miles, open throughout the year, is that from Valdez to Fairbanks, with a branch to Chitina. The expenditure during 1923 for construction and maintenance was \$740,000. Unfortunately road work was done under three separate departments, two Federal and one Territorial. Such aids to navigation as lights, buoys and signals were increased from 338 in 1915 to 634 in 1923.

Telegraphy. The importance of the signal corps system, with its 19 cables and 44 offices, may be gauged by its messages in 1923, whose tariffs approximated \$400,000. It had 2700 miles of cables, 840 miles of land wire, and a radio system. The governor reported: "The service rendered in the progress and development of Alaska cannot be overestimated." After 20 years' use the existing cables were inadequate for current business. New cables had been purchased and in the spring of 1924 were in process of installation. Supplementary to the army system was the Naval Communication Service, maintaining eight radio stations of great value to the public. See also LIGHTHOUSES.

ALASTRIM. See SMALLPOX.

ALBANIA. A Balkan country, whose boundaries were first fixed in 1913 and redrawn by the Council of Ambassadors on Nov. 9, 1921. Area estimated at 11,000 square miles; population, from 850,000 to 900,000. There were, according to a 1921 estimate, 584,675 Mohammedans; 158,215 Greek Catholics, and 88,987 Roman Catholics in the country. The estimated populations of the principal towns in 1921 were: Scutari, 26,000; Koritza, 22,000; Tirana, the capital, 13,000; Valona, 7000; Durazzo, 5000. Education was, of course, in its infancy. In 1921 the country possessed only one normal school, one secondary school, and about 500 primary schools.

Albania, because of its mountainous nature, possessed no real means of communication and was still a primitive pastoral and agricultural society. The leading products, cereals, olive oil, tobacco, rice, and wool, were raised for home consumption, though some exchange was carried on with the neighboring Jugo-Slav market towns to the North, and with Italy. The valleys of the South were more favorable for agricultural activities, and here it was that what prosperity

Albania could boast of was to be found. Natural resources reported capable of exploitation, but as yet little worked, were the timber lands, coal, iron pyrites, oil, asphalt, and hydro-electric power. Trade was insignificant. In 1921, exports totaled 2,189,796 gold francs, largely to Italy, Greece and Jugo-Slavia, and comprised skins, wool, dairy products, olives, olive oil, and tobacco; imports totaled 17,659,796 gold francs, covering purchases of cereals, fruits, oil, etc., from Italy, Greece, Great Britain. Because of the unfavorable trade balance a customs tariff was enacted, Feb. 5, 1922. During the War, the Austrians constructed a few narrow-gauge military railways, the most important of which was the line from Durazzo to Tirana, 23 miles. All these, however, fell into disrepair and were little used. Principal ports were San Giovanni di Medua, serving Scutari, Durazzo, and Valona. Italian boats were the only ones to call regularly. Government accounts for 1921 were expenditures, 18,797,455 gold francs, revenues, 18,500,000 gold francs, 5,000,000 in customs, and the remainder in direct taxes. There was practically no public debt. In 1914, Austria and Italy extended Prince William a credit of 10,000,000 francs; these claims were really eliminated, however, by the revenues collected by Austrians and Italians during the War occupation and retained at Vienna and Rome.

History. The conflicting aspirations of Russia and Austria left much to be desired in the Albanian settlement of 1913 as effected by the Ambassadors' Conference. It has been estimated that upward of 500,000 Albanians were separated from their homeland and apportioned among Serbia, Montenegro, and Greece. The choice of William of Wied, a German prince, as Mpret of Albania, was also a cause of much local discontent. He arrived at Durazzo, Mar. 7, 1914; stayed under the shadow of the Austrian guns in the harbor during his brief reign of six months, and fled the country for Germany on the outbreak of the War. Once more Albania was left without a unified control and at the mercy of the greater powers that surrounded it. Local chieftains dominated the scene until the conclusion of the War, though they were helpless in the face of the invading armies. For although it was neutral, Albania was a theatre of war during 1914-18. Austrian armies took possession of northern and central Albania, Italy was established at the harbor of Valona from November, 1916, on; the Serbs encroached on the northern frontier and the Greeks on the southern. By the secret Treaty of London (April, 1915), Albania had been disposed of rather baldly as part of the bargain for Italian support. The Allies in this convention recognized the Italian claim to Valona, while Italy on her side promised not to resist the possible desire of France, Great Britain, and Russia to distribute among Montenegro, Serbia, and Greece the northern and southern parts of Albania. It was, therefore, to protect her rights that Italy in June, 1917, announced a virtual protectorate over the country, and proceeded to occupy the whole of it when the Allied drive, in the autumn of 1918, banished the Austrians. Within the same year, matters were further complicated by the establishment of a republic under French protection in the neighborhood of Koritza, the presence of an Allied force at Scutari, and the threatening movements of the Serbs on the North and West. Throughout 1919

the Italians stayed on. Against the protests of Albanian leaders, Italy persisted in a policy of Italianization in the South, sending colonists and gaining control of the schools. Only the refusal of President Wilson at the Peace Conference to countenance either partition or the establishment of an Italian mandate prevented the submergence of the harassed country. Thus protected, Albanian resistance strengthened. In January, 1920, an assembly at Lushnja protested against partition; later in the year, a permanent government, strongly nationalistic in tone, established itself at Tirana and erected a regency cabinet of four, composed of a representative each of the Roman Catholics, Greek Orthodox, and the two Moslem sects, the Sunni and the Bektashi. Finally, in the middle of the year, desultory warfare began between Albanians and Italians which manifested itself first in uprisings in the coast towns and then in fighting inland. Italians were even besieged at Valona in June. The Italian adventure had proved futile, with the result that Giolitti, for Italy, signed a convention on August 2 which guaranteed the evacuation of the country and the surrender of Valona, too, except for the island of Saseno at the entrance to Valona Bay. The French had, meanwhile, left Koritza in the same year. There seemed at last a hope for a peaceful political development when, on Dec. 17, 1920, Albania applied and was admitted into the League of Nations. It was not until 1923 that Albania was cut free from international entanglements. It was plain in 1921 that admission into the League did not connote recognition of sovereignty or the frontiers of 1913. Jugo-Slavs still menaced on the North. Disquieting Greek claims were made on southern Albania or the Northern Epirus, a district containing the two important towns of Koritza and Argyrocastro and holding a population of 120,000 Greek Catholics and 80,000 or 100,000 Mohammedans, and where, in 1920, the Greeks had occupied a large strip to the Northeast of Koritza containing 26 villages. These claims were grounded on cultural sympathy and economic necessity. Albanian appeals to the League Council for intervention throughout 1921 were unavailing. The Powers insisted that the question was rightly the concern of the Council of Ambassadors. Meanwhile in the autumn, Jugo-Slavs had begun threatening military preparations in the North, and the danger of a Balkan flare-up caused Lloyd George, in November, to demand for Great Britain an immediate consideration of the whole question. Great Britain's sincerity was attested by the granting of formal *de jure* recognition to Albania. On November 5, therefore, the Council of Ambassadors announced a decision. Albania was recognized as a sovereign state; in the South, i. e. Northern Epirus, the boundary of 1913 was substantially promulgated though the Greeks were permitted to retain five of the seized villages; in the North, however, to placate Jugo-Slavia, modifications in her favor were ordered in the frontier in the Northeast of Scutari, to the West and South of Prizren, and between Dibra and Struga. Finally, a boundary commission was appointed for the delimitation of the line in question. The southern frontier was being worked on in the summer of 1923, the Greeks having given their approval by withdrawing their claims to the rest of the Northern Epirus, and it was in the course of these activities that the murder of General Tellini, on

the Council of Ambassadors' Græco-Albanian Boundary Commission, occurred at Janina, Greece, Aug. 25, 1923. (See GREECE and ITALY). By 1923, therefore, Albania's independence was assured, Italy's consistently friendly attitude since 1920 guaranteeing the result.

In internal affairs, some progress was made toward stability. Executive authority was in the hands of the Regency Cabinet, which was aided by an indirectly elected parliament of 72 members and a council of eight ministers responsible to the parliament. Steps were taken to create educational facilities, while movements toward hastening religious independence were perceptible in 1924. In 1922, the Albanian Greek Orthodox Church proclaimed its independence, and in the next year Albanian Moslems approved of the abolition of both polygamy and the veil for women. At the request of its officials in 1922, the League of Nations appointed to Albania a financial adviser who in 1923 had perfected plans for the creation of the country's first bank of issue. From Dec. 22, 1921, on, a coalition government made up of representatives of the two parties, the Progressive and Popular, and headed by Djafer Ypi as president of the Council of Ministers, was in control of affairs. This was followed by the ministry of Ahmed Zogu, December, 1922-June, 1924, under which the country remained unusually tranquil. But Albania again became a Balkan storm-centre in the spring of 1924, when a revolt, led by the liberal forces who opposed the mediæval tendencies of the government, successfully overthrew the Ahmed Zogu cabinet on June 10. In January, 1924, a constituent assembly met for the preparation of a constitution.

ALBANY. The capital of New York State. The population increased from 100,253 in 1910 to 113,344 in 1920, and to 117,375 by estimate of the Bureau of the Census for 1923. The land for several blocks between Broadway and the Hudson River, together with docks and wharfage rights, was bought by the city for a public park. Broadway and Quay Street were widened and extended. The privately owned Hudson bridge, which carried the main thoroughfare between Boston and New York, was bought by the State in 1919, and the tolls discontinued. The roadway leading up to it was widened and paved and the sharp blind turn into Broadway made easier. In 1918 and 1919, \$1,150,000 was appropriated by the Legislature to erect a new State office building. A city plan was made and zoning adopted. During the decade the city had a great industrial development. The value of its manufactured products increased from \$25,211,000 in 1914 to \$45,455,000 in 1919. Many large business buildings were erected. These included the Wellington Hotel, the Albany Journal building, the Henry Ford plant, and others. The New York Central Railroad constructed a great bridge and freight yards south of the city at a cost of \$16,000,000. Many improvements were made on the parks, especially Lincoln Park, and important street improvements effected. Great progress was made also along educational and recreational lines.

ALBEE, FRED HODDLETT (1876-). An American orthopædic surgeon, born in Alna, Me., and educated at Bowdoin College (A.B. 1899) and Harvard (M.D. 1903). He is widely known for his so-called bone inlay grafting operation for tuberculosis of the spine (Pott's disease),

first described by him in 1912. In 1916 he reported the results of 500 cases of "Albee's operation." In France in 1916 he was the first to use motor-driven tools in bone surgery. In 1917, after the entrance of the United States into the War, he was made a colonel of the Medical Reserve Corps, having meanwhile served as consulting surgeon in many hospitals. Among positions held by him were director of the orthopaedic clinic at the New York Post-graduate School and Hospital, and at the University of Vermont; director of the United States Army General Hospital No 3, and consulting surgeon to the Pennsylvania Railway System. He published his monograph *Bone Graft Surgery* in 1915 and in 1919 his large treatise *Orthopaedic and Reconstructional Surgery*.

ALBERS-SCHÖNBERG, HEINRICH ERNST (1865-1921). "The acknowledged leader of German medical röntgenology," a native and resident of Hamburg, where he practiced after graduation (MD) at Leipzig in 1891. His original bent was toward gynecology, but on Röntgen's discovery he at once opened an X-ray laboratory, one of the first on record, and by 1897 had founded the periodical *Fortschritte an der Gegend der Röntgenstrahlen*, followed in 1900 by *Archiv und Atlas der Normalischen und Pathologischen Anatomie in Typischen Röntgenbildern*. In 1903 appeared his textbook *Die Röntgen Technik* (5th ed, 1919). About 1902 he was appointed röntgenologist to the St. Georg Hospital, Hamburg, and a famous X-ray establishment was created in association with it. When the new University of Hamburg was established in 1919 he was appointed a professor of röntgenology, the first of the kind in Germany. He was a cofounder of the German Röntgenological Society. As a pioneer he made many discoveries not only in the physiology of the X-ray but in technical improvements of the apparatus, including the means of self-protection. He discovered the pernicious action of the rays on the genital glands. Incidentally he was a martyr to the rays, as one of the first to develop X-ray cancer as a result of exposure. Through the loss of an arm by amputation he managed to survive through many years of usefulness before finally succumbing. In addition to the magistral works mentioned above he wrote over 150 articles for periodicals. Among his minor works is a monograph on X-ray cancer (*Das Röntgencarcinom*).

ALBERT, DUKE OF WÜRTTEMBERG (1865-). A German general, born at Vienna. He was appointed general in command of the Württemberg army in 1908, and in 1913 he was appointed inspector-general of the 6th Army Inspection. He led the 4th army on the western front at the beginning of the War and in 1916 was made field-marshal-general. He became chief-in-command at the front in Alsace-Lorraine, where he remained till the end of the War. See *WAR IN EUROPE, Western Front*.

ALBERT I. King of the Belgians (see Vol. I). When Prince Albert ascended the throne of Belgium in 1909 he was perhaps the least known monarch of Europe, and even as King he escaped public comment. Following the invasion of Belgium by the Germans he was regarded as one of the foremost figures of the War. Rather than leave Antwerp with his ministers when the enemy was advancing through his country, he joined his troops and remained at the front throughout the War. Queen Elizabeth

remained near him, acting as a nurse in the Hôpital de l'Océan at La Panne.

ALBERTA. A province in western Canada with an area of 255,285 square miles, and a population in 1921 of 588,454, representing a gain of 214,159 or 57.2 per cent since the 1911 census. The rural population in 1921 was 62 per cent of the whole as compared with 75 per cent in 1901. As in the other prairie provinces, males continued in excess of females, the division in 1921 being 324,208 males and 264,246 females. The leading cities with their populations in 1921 were Calgary, 63,305; Edmonton, 58,821; Lethbridge, 11,097, and Medicine Hat, 9,634. Immigrants from the United States steadily increased in number so that the census of 1916 recorded 91,600 settlers of American origin in Alberta.

Industry. Under the impetus of vast irrigation projects, Alberta was rapidly converted into an agricultural country, so that by 1922 at least 13 per cent of the 74,000,000 acres of arable land in the province were under crops. At the end of 1921 irrigation projects took in 5,630,000 acres, of which 1,714,000 were irrigable. The result of such activity manifested itself in the appearance of a more diversified husbandry and a greater attention to root crops and alfalfa. However, the prairie country accounted for the importance of wheat. Of the 11,316,542 acres sown in 1923, 5,958,361 were under wheat. Next in importance were oats, barley, rye, hay and clover, and potatoes. That the live stock industry did not decline, in spite of the inroads of the farmers, may be seen from the following: cattle in 1912 and 1923, 745,229 and 1,520,924; sheep, 135,075 and 239,174, swine, 278,747 and 706,681. The total yield of field crops in 1923 was valued at \$165,340,000. The importance of the subsidiary activities may be gauged from these values for 1923: animals slaughtered and sold, \$11,584,000; dairy products, \$15,534,000; wool clip, \$264,000, game and furs, \$40,000; poultry and poultry products, \$6,264,000; horticultural products, \$1,860,000. In 1921, there were 83,431 farmers in the province. Minerals made up the second source of economic wealth. The vast coal area which covers almost the entire province accounted for 95 per cent of the annual output of all the prairie provinces. In 1922, 354 mines, representing a total capital of \$53,000,000, produced 5,990,911 tons of coal for a value of \$24,351,913, more than double the output of 1912. Proportions represented were 1 per cent anthracite, 47 per cent bituminous, and 52 per cent lignite. Other mineral products included cement, natural gas, sand and gravel, bitumen, gold, and salt. The total mineral production was \$27,872,136 in 1922, an increase of \$16,000,000 over the 1912 output. Local manufactures increased during 1910-21 from 290 to 2024; capital, from \$29,518,000 to \$55,539,000, employees, from 6980 to 10,324; and value added by manufacture, from \$8,790,000 to \$29,724,000. The leading industries were flour and grist mills, door and planing mills, slaughtering and meat packing. The horse-power resources were estimated at 475,281 h.p., of which 33,067 h.p. had already been developed on the Bow River in 1921. Lumbering and fishing were also important activities.

Trade and Communications. The articles entering principally into the interprovincial trade were grain, live stock, hams, eggs, fish, butter, mining, and timber products. In 1922

there were 4680 miles of railway in the province as compared with 2545 miles in 1914. The telephone system owned by the provincial government had 100,900 miles of wire in 1922. Throughout the province 64,383 telephones and 238,733 miles of wire were in use.

Government. The province's representation in the Canadian Parliament was increased to 6 in the Senate and 12 in the House of Commons. Revenues for 1922 were \$9,324,889, against \$5,399,905 in 1913, and expenditures \$11,235,192, against \$5,275,584 in 1913. The public debt in 1921 amounted to \$59,010,256. Education made steady advances. The 142,902 pupils enrolled in 1922 were more than double the number of pupils of 1912. The University of Alberta had more than 1200 students in attendance in 1922. Total expenditures for education in 1912 were \$6,667,282; in 1921, \$12,134,488. Women were granted the franchise.

ALCHEMY, MODERN. See **PHYSICS**.

ALCOCK, SIR JOHN (1892-1919). A British airman born at Manchester who obtained his training at the Empress motor works in his native city. He was instructor of flying at Eastchurch at the outbreak of the War and was afterward chief instructor with the aeronautic squadron. On the Turkish front he won the D.S.O., for an attack on three seaplanes, and established a record for long-distance bombing flights. In 1917 the Turks took him prisoner and held him till after the Armistice. In 1919 he won the prize offered by the London *Daily Mail* for the first successful flight across the Atlantic, with Lieut. A. W. Brown. Both men were knighted for this achievement. Alcock was killed at Côté d'Evvard, north of Rouen, in France, by the crashing of his airplane.

ALCOHOL, ETHYL. See **CHEMISTRY, ORGANIC**.

ALCOHOLISM AND INSANITY. See **INSANITY**.

ALDEN, CARLOS COOLIDGE (1866-). An American lawyer born at Wilmington, Ill. He received his degrees of L.L.B. and L.L.M. at New York University and in 1893 was admitted to the bar. He practiced in New York from 1893 to 1904 and was associate professor of law in New York University, 1896-8; professor, 1898-1904. In 1904 he became dean of the Buffalo Law School. He was legal adviser to Governor Hughes in 1909 and in the next year became New York State Commissioner on Uniform State Laws. He is the editor of *A Handbook of the Code of Civil Procedure* (1901), the second edition of *Abbott's Practice and Forms* (1907), the second edition of *Abbott's Forms of Pleading* (1918), and *Handbook of Civil Practice* (1921).

ALDEN, RAYMOND MACDONALD (1873-). An American scholar and educator (see Vol. I). His later works include *Tennyson, How to Know Him* (1917), *Critical Essays of the Early Nineteenth Century* (1921), *Shakespeare* (1922), and *The Boy Who Found the King* (1922).

ALDERSON, VICTOR CLIFTON (1862-). An American college president born at Plymouth, Mass., and educated at Harvard University. After teaching in middle western high schools, 1885-93, he became successively professor of mathematics (1893-8), dean (1898-1900), acting president (1900-1), and dean (1901-3) of the Armour Institute of Technology, Chicago. He was president of the Colorado School of Mines from 1903 to 1913 and resumed the office

in 1917. Between 1913 and 1917 he was president (1913-15) and consulting mining engineer (1915-17) of the Winnemucca (Nev.) Mountain Mining Company. He is author of *The Oil Shale Industry* (New York, 1920) and *Oil Shale: a Résumé for 1921* (Golden, Colo., 1923).

ALDIN, CECIL C. W. (1870-). An English illustrator (see Vol. I) whose latest published work includes. *Old Inns; Old Manor Houses* (1924) and *The Hunting Countries of England*.

ALDINGTON, HILDA DOOLITTLE ("H. D.") (1886-). An American poet, born at Bethlehem, Penn. She entered Bryn Mawr College in 1904 and later went abroad. Her poetry placed her among the most important of the Imagists. Her works, which have appeared in many periodicals, are distinctly Hellenic in their delicacy and cold beauty. Her publications include *Oread; Pear Tree; Heat; and Lethé*.

ALDRICH, CHESTER HOLMES (1871-). An American architect, born at Providence, R. I., and educated at Columbia University and the Ecole des Beaux Arts, Paris. He has followed his profession since 1902 in New York, as member of the firm of Delano and Aldrich, designers of many well-known public buildings and private residences. From 1917 to 1919 he was Director General of Civil Affairs of the American Red Cross Commission to Italy, and received various Italian decorations. He is a director of the Musical Art Society of New York and of the Music School Settlement, New York.

ALDRICH, MORTON ARNOLD (1874-). An American educator, born at Boston, Mass. After graduation from Harvard University in 1895, he was a student at the Universities of Berlin, Munich and Halle, obtaining the doctorate from the last named institution. He became successively instructor of economics at Harvard, assistant professor at Leland Stanford, and professor at Tulane University. Since 1914 he has been dean of the College of Commerce and Business Administration at Tulane University. As member of the American Economic Association and Secretary of the Association of Collegiate Schools of Business, Professor Aldrich has devoted himself to the practical application of economic doctrines to the needs of business administration.

ALESSANDRI, ARTURO (1869-). A president of Chile, born Dec. 21, 1869. After receiving his preliminary training in the Catholic schools, he took up the study of law at the University of Chile. When but 24 years of age he was successful as a lawyer and in 1898 was elected by the Liberal party to the Chamber of Deputies. Later he became minister of state, and held the portfolios of industry and public works. He was given important posts under nearly every administration. On Dec. 23, 1920, he took office as President of the Chilean Republic.

ALEXANDER, KING OF THE HELLENES (1893-1920). The second son of King Constantine and Queen Sophia was born on Aug. 1, 1893, and ascended the throne of Greece on June 12, 1917. His original attitude of active personal interest in his subjects and kingdom immediately won for him the loyalty of his people. The diplomatic triumphs of Venizelos, Liberalist leader, at the Peace Conference, met serious reverses with the sudden death of Alexander on Oct. 27, 1920, by blood-poisoning from

the bite of a pet monkey. The Venizelist party was defeated in the general election which followed, and the exiled King Constantine was recalled to the Greek throne.

ALEXANDER I (1888-). King of the Serbs, Croats, and Slovenes. The second son of Prince Peter Karajorgjevic, later King of Serbia, was educated at St. Petersburg, and entered (1904) the *corps des pages* at the Czar's court. He was formally recognized as crown prince in 1909. On the outbreak of the Balkan War he had nominal command of the First Army. Because of the ill health of King Peter he was made prince regent in 1914, and was therefore commander-in-chief of the Serbian army when the War started. The Prince personally became very popular with his soldiers, whose privations and hardships he shared. When the exiled Serbian government was established at Corfu, he was warmly received on his visits to Paris and London. On Dec. 1, 1918, he was formally recognized as regent in all the Jugo-Slav provinces by delegates of the Jugo-Slav National Council in Jagret. At the instigation of the Communists and other revolutionary groups, an attack was made on his life on June 28, 1921. He succeeded his father as King of Jugo-Slavia on Aug. 16, 1921.

ALEXANDER, CARTER (1881-). An American educator, born in Paris, Mo., and educated at the University of Missouri and Columbia University. He held various positions as teacher and as superintendent of schools in Missouri from 1898 to 1908. From 1908 to 1910 he was research scholar and later fellow in education at Columbia University. He was assistant professor of educational administration at the University of Missouri (1910-13), taught successively in the summer schools of Columbia and Chicago Universities, and from 1913 to 1918 was professor of school administration and chairman of the committee on graduate work at the George Peabody College for Teachers at Nashville, Tenn. He was first assistant to the State Superintendent of Public Instruction of Wisconsin (1918-21) and in 1921 became assistant director of the Educational Finance Inquiry in New York. Besides contributing to periodicals he published *Some Present Tendencies of Teachers' Voluntary Associations* (1910), *School Statistics and Publicity* (1919), and *Publicity Campaign for Better School Support*, with W. W. Theisen (1921).

ALEXANDER, HARTLEY BURR (1875-). An American scholar and educator (see VOL. I). During the War he represented the ultra-pragmatic wing of American philosophy and sought to apply philosophizing to the everyday problems of war and peace. *Liberty and Democracy* (1918) is a collection of such contemporary essays. *Letters to Teachers* (1919) is an appeal to educators to forego the academic routine. His other works include *Mythology of All Races*, vol. x: *North American* (1916); vol. xi; *Latin American* (1920); and a volume of poetry, *Odes and Lyrics* (1921). In 1919 he served as president of the American Philosophical Association.

ALEXANDER, HUBBARD FOSTER (1879-). An American ship-owner engaged in ocean transportation. He was born at Colorado Springs, Colo., and received a high school education. He began as wharf agent of Dodwell, Carlill and Company, Ltd., at Tacoma, in 1897, and in 1900 entered the Commercial Dock Company of Tacoma, of which he became president in 1901.

He was president of the Alaska Pacific Steamship Company in 1907, of the Alaska Coast Company in 1908, president of the Alaska Navigation Company in 1911, and in 1916 president of the Pacific Steamship Company (Admiral Line). Other offices which he has held are director of the Dollar Steamship Lines, director of the First National Bank of Seattle, and member of the National Foreign Trade Council, the American Bureau of Shipping, and the American Steamship Association.

ALEXANDER, JAMES STRANGE (1805-). An American banker born at Tarrytown, N. Y., and educated in the public schools. Entering the National Bank of Commerce, New York City, in 1885, he was made vice-president in 1908 and president in 1911. In 1907-08 he was treasurer of the American Express Company. He has been chairman of the board of the French-American Banking Corporation; director of the American Express Company, the American Foreign Securities Company, the Pacific Oil Company, the American Telephone and Telegraph Company, the Prudential Insurance Company of America, and the Federal Reserve Bank of New York; trustee of the American Surety Company; chairman of the executive company of the National Committee on European Finance; member of the New York Liberty Loan Committee, etc. He was a member of the New York Clearing House Committee, 1913-16 and 1919-21. He was decorated by various foreign governments.

ALEXANDER, MAITLAND (1867-). An American clergyman born in New York and educated at Princeton University, McCormick Theological Seminary in Chicago, and Princeton Theological Seminary. He was ordained in the Presbyterian ministry in 1892 and held several pastorates in New Jersey and New York (1893 to 1899). He accepted a pastorate in Pittsburgh in 1899 and became moderator of the Presbyterian General Assembly (1916).

ALEXANDER, ROBERT (1863-). An American army officer, born in Maryland. He graduated from the Army Staff College in 1910; was promoted through the grades, and reached that of colonel in 1917, after service in the Spanish-American War, the Philippines, Cuba, and Mexico. He went to France in 1917 as inspector-general, Line of Communications, was commander of the 41st Division in 1918, and of the 77th Division from August, 1918, to May, 1919. In this capacity he took part in the Oise-Aisne, Argonne-Meuse, and Marne-Aisne operations. On Aug. 4, 1921, he was appointed commander of the 3d F. A. Brigade.

ALEXANDER, SAMUEL (1859-). An English philosopher and educator (see VOL. I). With the publication of his Gifford Lectures, *Space, Time and Deity*, in two volumes (1920), he joined the ranks of the leading English philosophers. His work was hailed in many quarters as combining the sweep of the great German metaphysicians with the critical insight characteristic of the British tradition. From his point of view as a realist, Professor Alexander constructs a genuine ontological metaphysics. Space-time is his ultimate reality, and he regards the entire universe as a hierarchy of complexes of this primitive matter; new qualities evolve out of the lower complexes; it is thus that life, sensation, and mind come into being; and universals are patterns which are repeated at various places in the scale of

evolution. His conception of God is quite original. "God as actually possessing deity does not exist but as an ideal, is always becoming; but God as the whole Universe tending toward deity does exist." Unlike the American neo-Realists, Professor Alexander is opposed to behaviorism in psychology. He regards mind as a new quality and not as the neutral cross-section imagined by Prof. E. B. Holt. Professor Alexander was made Honorable Fellow of Lincoln College, Oxford, in 1918. His works since 1914 include a number of articles on mind, discussions at the Aristotelian Society, and a lecture on *Spinoza and Time* (1921). For a critical consideration, see PHILOSOPHY.

ALEXANDER, WALLACE MCKINNEY (1869-) An American sugar manufacturer born on the Island of Maui (H. I.), where he has extensive sugar plantations and refineries. He was educated at Yale University. He was appointed chairman of the commission visiting Japan (1920), chairman of the Japanese Relations Committee of California, and president of the San Francisco Chamber of Commerce (1921). He has been president of Alexander Baldwin, Ltd.; vice-president of the Matson Navigation Company, of the Hawaiian Commercial and Sugar Company, Ltd.; and of the Honolulu Consolidated Oil Company of California; and director of the California and Hawaiian Sugar Refining Company.

ALEXEYEV, MIKAIL (1857-1918). A Russian general. He entered the army in 1876 and completed his course at the General Staff College in 1890. He became a member of the Russian General Staff and in 1904 was made general. He took part in the war with Turkey and in the Russo-Japanese War. At the beginning of the War in 1914 he was chief of staff on the southwestern front, and credit for the Russian victory of that year in Galicia was given to him. In 1915 he was transferred to the northwestern front, where he had eight armies under his command. In August, 1915, he became chief of the headquarters supreme command and worked with the Emperor. A breakdown in health compelled him to resign late in 1916. After the revolution of March, 1917, he was made commander-in-chief but was dismissed in May. Kerensky called on him for assistance in September, and he was at headquarters for 12 days. Not wishing to work with Kerensky or Kornilov, he then left, and at the beginning of the Bolshevik rule he fought against it in South Russia. He died in 1918, of heart disease.

ALEY, ROBERT JUDSON (1863-). An American educator (see VOL. I). After acting as president of the University of Maine (1910-1921), he became the president of Butler College. Recently he has contributed to the *Educational Review, School and Society*, etc.

ALFALFA LEAF WEEVIL. See ENTOMOLOGY, ECONOMIC.

ALFONSO XIII (1886-). King of Spain (see VOL. I). He made tireless efforts during the War to assist refugees and to obtain information concerning prisoners and the missing. As a neutral, Spain was in a position to do a service of this sort; but recognizing that it was not a governmental duty, the King carried on the work entirely on his own initiative.

ALFRED UNIVERSITY. A nonsectarian institution at Alfred, N. Y., organized as a school in 1836 and as a university in 1857. The student enrollment increased from 447 in 1912 to

586 in 1924, the staff of instructors from 42 to 45, and the library from 25,000 to 36,000 volumes. The endowment, including buildings, equipment, etc., increased from \$500,000 to \$1,206,000. A central heating plant and a new laboratory hall were built and the Greene Block was taken over for college purposes. President, Rev. Boothe Colwell Davis, Ph.D., LL.D.

ALGERIA. A French colony and territory in North Africa. Its area is estimated variously from 222,180 to 343,000 square miles. The population according to the census of 1921 was 5,802,464, of whom the northern division contained 5,256,420, and the southern, 546,044. The population in 1911 was 5,563,828. Of the total population in 1921, Europeans numbered 831,040, against 681,772 in 1911, and the natives 4,971,424, against 4,711,276 in 1911. Frenchmen made up the majority of the European colonists, though it was estimated that Algeria contained 150,000 Spaniards and 40,000 Italians, who were attracted by the liberal land grants offered by the government. The chief towns reported the following population figures for 1921: Algiers, 206,595, an increase of 34,199 over 1911; Oran, 141,156; Constantine, 78,220; Bone, 45,171; Tlemcen, 43,090; Tizi-Ouzou, 35,171; Sidi-bel Abbès, 37,752; Blida, 36,384; Philippeville, 33,808; Sétif, 30,867. The native population, consisting of native Arabs, Berbers, Kabyles, and Mozabites, was entirely Mussulman. The chief Christian church was the Roman Catholic. Several Protestant churches and Jewish synagogues were supported by government grants.

Industry and Commerce. Agriculture continued the leading activity of the population. An enlightened government interest contributed to its continuous development. European colonists in particular were encouraged to apply themselves to scientific cultivation. Irrigation was resorted to and the Algerian bureau of agriculture did much to encourage the introduction of rust- and drought-resisting varieties of hard and soft wheat. The centres of production of cereal culture moved further and further South during the period, leaving the coast regions to the cultivation of vineyards, citrus fruits, vegetables, tobacco, etc. The leading cereal crops, wheat, barley, and oats, produced a yield of 1,008,280 metric tons in 1922 as compared with 2,317,000 tons in 1921, and 1,089,840 in 1910. Because of the hard wheat produced and the presence of many skilled Italians, the manufacture of macaroni became important during the period. Production reached 17,500 tons annually, of which 4358 tons were exported in 1921 and 1695 tons in 1922. The manufacture of flour and semolina, too, grew in importance. The cultivation of the vine, following cereals in order, yielded 5,002,112 hectoliters in 1921 and 7,473,091 in 1922 as compared with 8,413,654 in 1910. Tobacco planting showed the best advances during the decade. In 1913, 26,785 acres under cultivation yielded 10,866 metric tons; in 1921, the planting was 53,810 acres and the yield 22,512 tons. The growth in the industry was due to the encouragement given by the French Tobacco Monopoly which bought up the major part of the crop. Other products contributing to the wealth of the colony were alfalfa or esparto grass, palm leaf fibre, fruits, vegetables, lumber, woods, charcoal, etc. Algeria, too, furnished France with one-fourth of its

sheep consumption. Minerals, principally iron ore and phosphates, were also important. There were mined in 1922, 1,045,816 metric tons of iron ore (1,432,748 in 1913), 484,304 tons of phosphates (370,934 in 1913), 31,439 tons of zinc (118,884 in 1913), 1390 tons of petroleum (67 in 1913). After the War, efforts were made to develop a greater coal and lignite production, but with only little success. Figures for trade follow: imports for 1913, 1920, and 1922, 667,305,000, 3,072,707,000, and 2,077,089,000 francs, respectively; exports for the same years, 501,169,000, 1,355,372,000, and 1,379,491,000 francs. The balance of trade thus continued unfavorable, but this was largely written off by the income due Algerians on foreign securities and by the expenditures of tourists. Leading exports in 1922 were wine, 426,509,000 francs; sheep, 104,258,000; raw silk, 15,726,000; tobacco, 45,654,000; and cigarettes, 38,696,000. France, in 1921, took 73.93 per cent of the Algerian trade, United States 5.03 per cent, Morocco 4.4 per cent, and Great Britain 3 per cent. On Dec. 31, 1922, there were 1751 miles of railway operated by the state and 2464 miles by the Paris, Lyons, & Mediterranean Company. In 1912 there were 2049 miles in all. In 1920 a vast improvement scheme was announced, calling for the development of railways, vehicle roads, ports, schools, colonization, postal, telegraph, and telephone communications, reforestation, irrigation, etc., and for this work loans up to 1,600,000,000 francs were authorized by the French law of July 23, 1921. Of this programme, by 1923, only some 400 miles of railway were in construction or projected.

Government and History. There were no important administrative changes in the colony during the period, except the extension of French citizenship in 1919 to veterans of the French army or navy, landowners, farmers, licensed traders, those capable of reading and writing French, and possessors of a French decoration. Estimated revenue for 1912 and 1922 was 151,690,315 francs and 377,864,674 francs respectively; expenditure for 1912 and 1922 was 151,660,255 francs and 377,564,649 francs. In 1912, the direct taxes on natives were suppressed. There was no external debt, and the French government met the expenses of the War and of naval establishments. The colony remained peaceful during the period 1914-24, and its economic progress proceeded unchecked under the beneficent eye of the French imperial administration. But the European population grew very slowly, under the deterrent influence of the system of land tenure. Colonists found their acquisition of property checked by the faulty titles and the refusal of the natives to sell their land, much of which was held by communities. Again, the onerous conditions imposed upon colonists by the state, i. e. a five years' residence requirement for a complete title, retarded immigration.

ALIEN ENEMY PROPERTY CUSTODIAN. See UNITED STATES, *History*.

ALKALI EARTH METALS. See CHEMISTRY.

ALLEE, WARDER CLYDE (1885-). An American zoologist and teacher, born at Bloomington, Ind., and educated at Earlham College and the University of Chicago. He was assistant professor of zoology at Oklahoma University (1914-15); professor of biology at Lake Forest College (1915-21); assistant professor of zoology at the University of Chicago (1921-23),

and associate professor there (1923-). He was on the teaching staff of the Marine Biological Laboratory at Woods Hole (1914-21), lecturer in zoology at the University of California (1923) and secretary of the American Society of Zoologists (1918-). He has published numerous papers on animal reactions and on animal ecology, particularly on the ecology of the marine invertebrates of the Woods Hole region.

ALLEGHENY COLLEGE. A coeducational, nonsectarian college at Meadville, Pa., founded in 1815. A new gymnasium and an addition to the women's dormitory were built during the decade 1914-24, and the endowment was increased from \$1,000,000 to \$2,000,000. The student enrollment rose from 405 in 1916 to 540 in the year 1923-24 (102 in the summer of 1923), the faculty membership from 27 to 35, and the number of volumes in the library from 44,000 to 54,500. President, Fred W. Hixson, D.D., LL.D.

ALLEN, BENNET MILLS (1877-). An American zoologist born at Greencastle, Ind., and educated at DePauw University and the University of Chicago. He was instructor, assistant professor and professor in the University of Wisconsin (1903-13); professor of zoology at the University of Kansas (1913-22); and associate professor of biology at the University of California, Southern Branch (1922-). He was vice-president of the American Society of Zoologists (1922). He has published articles on various embryological subjects, the most noteworthy on the relation of the thyroid gland and hypophysis to the metamorphosis of the Amphibia.

ALLEN, CALVIN FRANCIS (1851-). An American engineer, born at Roxbury, Mass. He was graduated at the Massachusetts Institute of Technology in 1872, but after holding various engineering appointments, chiefly in connection with waterworks and railroads, he turned to law, was admitted to the bar, and practiced in both New Mexico and his native State. Returning in 1887 to engineering, he became successively assistant, associate, and then professor of railroad engineering in the Institute of Technology, until 1916, when he was retired. During the War he had charge of important work under the Fuel Administration in Massachusetts. Prof. Allen published *Railroad Curves and Earthworks* (1889), *Tables for Earthwork Computation* (1893), *Field and Office Tables* (1903), and *Business Law for Engineers* (1917).

ALLEN, EDWARD FRANK (1885-). An American editor and author, born in Newark, N. J. Positions which he has held through an active and varied career in journalism included that of reporter in Canandaigua, N. Y., 1904; contributor to the *New York Times* review of books since 1906; managing editor of the *Bohemian Magazine* (1908); publisher of *Book News Service* (1909); editor of *Travel* (1910-14); editor of *Lippincott's Magazine* (1914-15); editor of *McBride's Magazine* (1915-16); editor of *Travel* (1916-); and editor of *The National Marine* (1918-19; 1920-). He is also a contributor to *The Dial*, *Outing*, *Newspaper Feature Service*, *Scribner's*, *The Century*, *Country Life*, etc., and the author of *A Guide to the National Parks of America* (1915) and *Keeping Our Fighters Fit* (1918).

ALLEN, FLORENCE ELLENWOOD (1884-). An American judge, born at Salt Lake City,

Utah, and educated at Salt Lake College, Western Reserve University, the University of Chicago, and New York University. She began her career as assistant to the Berlin correspondent of the *Musical Courier* and was later music editor of the *Cleveland Plain Dealer* and lecturer on music for the New York City Board of Education. She was admitted to the bar and began her law practice at Cleveland, Ohio, in 1914. She became judge of the Court of Common Pleas of Cuyahoga County, Ohio (1921-26), and in 1922 was elected judge of the Supreme Court of Ohio. She was the first woman in America to hold such an office and the first woman in the world to judge first degree murder cases. She is author of *Patris*, a book of poems (Cleveland, 1908).

ALLEN, FREDERICK JAMES (1864-). An American vocational director, born at Limerick, Me., and educated at Dartmouth College and Harvard University. He held teaching positions at Boston University, Simmons College, etc., and subsequently became director of the Young Men's Civic Club of Boston (1904), investigator of occupations for the Vocational Bureau in Boston (1910-17), and director of the Bureau of Vocational Guidance of Harvard University. His works include *Vocations for Boys and Young Men* (1911), *The Law as a Vocation* (1913), *Advertising as a Vocation* (1918), and *A Guide to the Study of Occupations* (1921).

ALLEN, FREDERICK LEWIS (1890-). An American editor born at Boston, and educated at Harvard University. He was assistant in English at Harvard University (1912-14), assistant editor of the *Atlantic Monthly* (1914-16), and managing editor of the *Century Magazine* (1916-17). He was engaged in war publicity work for the Council of National Defense, 1917-19. From 1919 to 1923 he served as secretary to the Corporation of Harvard University. In 1923 he became literary adviser to the publishing house of Harper and Brothers.

ALLEN, FREDERICK MADISON (1879-). An American physician, originator of the Allen fasting treatment for diabetes. He received his education at Stanford University (M.D. 1907). At the Harvard Laboratory of Preventive Medicine and Hygiene he devoted several years (1909-12) to research in the nature of diabetes. Later he was on the staff of the Rockefeller Institute for Medical Research in New York and in 1919 founded the Physiatrie Institute at Morristown, N. J., a clinical and research institution for the study and treatment of diabetes and other nutritional diseases. The results of his early laboratory work were published in 1913 in a large volume, *Studies Concerning Glycosuria and Diabetes*, epochal in our knowledge of these disorders. In 1922 Dr. Allen, who is medical director of the Physiatrie Institute, established the *Journal of Metabolic Research*, of which he is editor-in-chief.

ALLEN, HENRY JUSTIN (1868-). An American governor born in Warren County, Pa., and educated at Baker University and Washburn College, Kan. He began professional life as an editor and subsequently owned several daily newspapers, especially in Kansas. He was in France with the American Red Cross in 1917 and 1918; in the latter year he organized the "home communication service" of the American Red Cross in France. He is best known for his work as governor of Kansas (1919-21), where he took an active interest in industrial problems.

He has contributed to magazines articles on political, industrial, and administrative subjects. He is author of *The Party of the Third Part* and *The Story of the Kansas Industrial Relations Court* (New York, 1921).

ALLEN, HENRY TUREMAN (1859-). An American army officer, born at Sharpsburg, Ky., and graduated from the United States Military Academy in 1882. After an exploration trip into Alaska in 1885, he was instructor in the Academy in 1888-89 and then military attaché in Russia and Germany; afterward he served with the army in Cuba, the Philippines, and Mexico. After organizing a cavalry brigade at Fort Riley, Kan., in 1917, and acting as commander at Camp Travis, Tex., he went abroad as commander of the American Forces in Germany, July 2, 1919. He is the author of *Reconnaissance of Copper, Tanana and Kuyukuk Rivers* (1886); *Military System of Sweden* (1895); *My Rhineland Journal* (1923).

ALLEN, IDA C. B. (1885-). An American dietician, born at Danielson, Conn., and educated at the English High School, Worcester, Mass., Oread Institute of Domestic Science, Worcester, and the Metropolitan Hospital, New York. She is a graduate dietician of the last-named institution. She has been dietician in several hospitals, director of domestic science in the Y. W. C. A., Worcester, Mass., lecturer on dietetics, and author of correspondence school courses. In 1920 she founded Mrs. Allen's School of Good Cookery. She is a contributor to various magazines and was formerly editor of "Three Meals a Day" (*Good Housekeeping Magazine*), "The Housewife's Forum" (*Pictorial Review*), and "Domestic Science" (*Woman's World*). She is author of *The Golden Rule Cook Book* (1916), *Mrs. Allen's Cook Book* (Boston, 1917); *Mrs. Allen's Book of Meat Substitutes*, *Mrs. Allen's Book of Sugar Substitutes*, and *Mrs. Allen's Book of Wheat Substitutes* (1918); *Woman's World Calendar Cook Book* (1922), and *The Bride's Book* (1922).

ALLEN, SIR JAMES (1885-). A New Zealand statesman, born in South Australia and educated at Clifton College and St. John's College, Cambridge, and the Royal School of Mines. He rendered invaluable service to the British government in its problems of an educational, military, and imperial nature. He had an uncommon faculty for solving financial and military questions. During the War he was an unpopular Minister of Defense under the Massey-Ward war coalition, but his unflinching accuracy and keen judgment subsequently regained public confidence and approval. In 1920 he retired from politics and became the Dominion's High Commissioner in London.

ALLEN, JAMES LANE (1849-1925). An American author (see Vol. I). He has added to his long list of works *The Last Christmas Tree* (1914), *Sword of Youth* (1915), *The Cathedral Singer* (1918), *Kentucky Warbler* (1918), and *Emblems of Fidelity* (1919).

ALLEN, JOEL ASAPH (1838-1921). An American zoölogist, born at Springfield, Mass., and educated at Wilbraham Academy and Lawrence Scientific School of Harvard University, where he studied under Louis Agassiz, whom he accompanied on his expedition to Brazil. He was in charge of mammals and birds at the Museum of Comparative Zoölogy (1867-85); curator of ornithology and mammalogy at the American Museum of Natural History in New

York City (1885-1919), and curator of mammalogy, that. (1919-21). In 1916 he published an autobiographical and bibliographical paper in which he listed titles of 1433 articles published up to that date. He was editor of *The Auk* (1884-91); *Bulletin of the American Museum of Natural History* (1886-1918); the zoological numbers of the *Memoirs of the Museum*, (1895-1918); *Check List of North American Birds* (1895 and 1910); *Supplement to the Code of Nomenclature and Check List of North American Birds* (1887), and *Code of Nomenclature* (1908).

ALLEN, RILEY HARRIS (1884-). An American editor, born at Colorado City, Tex., and educated at the University of Chicago. He was reporter on the *Honolulu Evening Bulletin* in 1905, but two years later he joined the staff of the *Seattle Post-Intelligencer* (1907-10), subsequently becoming city editor of the *Honolulu Evening Bulletin* (1910-12), and of the *Honolulu Star Bulletin* (1912). In 1918 he went to Siberia with the American Red Cross. In 1920-21 he was engaged in rescuing and repatriating the Russian children exiled in Siberia, and was decorated by the All-Russian Government with the Cross of St. Anne for his services. He has contributed to the *Saturday Evening Post*, *Collier's*, *Munsey's*, etc.

ALLEN, SHERMAN (1875-). An American public official, born at Westford, Vt., and educated in the public schools. He was reporter and city editor of the *Free Press* from 1895 to 1901, and later held many important positions of a political nature, among them that of assistant secretary to President William H. Taft (1910-11), Assistant Secretary of the Treasury (1911-13), and assistant secretary and fiscal agent of the Federal Reserve Board (1914-18). He was treasurer of the War Finance Corporation (1918-19), and in 1919 he identified himself with the National City Bank of New York.

ALLEN, WILLIAM HARVEY (1874-). American social worker and publicist, born at LeRoy, Minn., and educated at the Universities of Leipzig, Berlin, and Pennsylvania. He was a pioneer in the creation of agencies for the scientific study of social and administrative problems and did his most effective work as the head of the New York Bureau of Municipal Research, 1907-14. The idea of the expert in municipal affairs largely owes its inception and extension to his activities, and he himself has played the part of investigator and technical adviser for many local, State, and educational agencies. From 1915 he devoted himself to educational administrative problems, his organization, the Institute for Public Service, served as a clearing house for popular pamphlets and brochures on the subject. In fact he has been a pamphleteer meeting with unusual success in his work, and his catholicity of interests has insured his importance as an unofficial critic of social and governmental machinery. His published works include *Efficient Democracy* (1907), *Civics and Health* (1909), *Woman's Part in Government* (1911), *Modern Philanthropy* (1912), *Self Surveys by Colleges and Universities* and *Self Surveys by Teacher-Training Schools* (1917).

ALLEN TREATMENT FOR DIABETES. See **DIABETES**.

ALLENBY, EDMUND HENRY HYNDMAN (1861-). A British field marshal, born in

Felixstowe, England. He was educated at the Royal Military College at Sandhurst and in 1882 entered the Inniskilling Dragoons, with which he served in the Bechuanaland expedition of 1884-85 and in the Zululand operations of 1888; he also served in South Africa, 1899-1902, gaining for his services in that war the rank of brevet colonel, and was made a Companion of the Bath. In 1902 he was given the Fifth Lancers and in 1905 was promoted to command of Fourth Cavalry Brigade. He was advanced to major general in 1909 and a year later became inspector of cavalry. In 1914 he went to France in charge of the cavalry division and a year later was given command of the Fifth Army Corps; shortly afterward, he became chief of the Third Army, participating in the battle of the Somme. The promotion to general was given him in 1917, and he was placed in command of the troops in Egypt and Palestine. The Palestine campaign of 1917 under his direction was brilliantly conducted, culminating in the capture of Jerusalem on Dec 9, 1917. Later in 1918 he completed his undertaking by occupying Damascus and Beirut, and all Syria passed into the hands of the Allies. For his services in the War he was promoted to the rank of field marshal and made Viscount Allenby of Megiddo and Felixstowe. Since 1919 he has been High Commissioner for Egypt, with headquarters in Cairo. Besides being made a Commander of the Bath (1915), Grand Cross of St Michael and St. George (1918), and Grand Cross of the Bath (1918), he has received the Distinguished Service Medal of the United States, the Croix de Guerre of both France and Belgium, and many other foreign decorations. For his success in the Palestine campaign the British government made him a grant of £50,000. See *With Allenby in Palestine* by F. S. Brereton (1920) and *Allenby's Final Triumph* by W. T. Maffey (1920). See **WAR IN EUROPE**, *Turkish Front*.

ALLENSTEIN-MARIENWERDER. Articles 94-98 of the Treaty of Versailles, as a result of the demands of the Poles, provided for the holding of plebiscites in the two regions known as Allenstein and Marienwerder (total area, 15,000 square kilometers). Allenstein, made up of eight East Prussian districts (*Kreise*), seated a population of 556,000, of whom 268,000 were Poles and 288,000 Germans. It is a little-frequented region of forests and marshland, whose leading economic activity is the export of wood. The Poles here had embraced Protestantism in the sixteenth century, and this, as well as their long dependence on their German masters, had estranged them from the great body of Catholic Poles. Marienwerder, consisting of four West Prussian districts, was much more important, although smaller. Its population included 24,000 Poles and 114,000 Germans. Its location on the East bank of the Vistula, and the fact that it was traversed by the Danzig-Mlava railway, the shortest route from Danzig to Warsaw, made its disposition a matter of the first moment to Poland. Inter-Allied commissions took control of both areas until the date fixed for the plebiscites, June 11, 1920, but the presence of troops could not check the frequent disorders, for the most part the work of irregular Polish bands. The votes, as finally taken on July 11, yielded German victories in both areas. In Allenstein 98 per cent of the vote was for Germany, and in Marien-

werder, 92 per cent. The two regions therefore were turned over to Germany. The Treaty of Versailles had assured Poland control of the Vistula, and it was to effect this that the Council of Ambassadors attempted to assign Poland a strip on the Vistula's East bank 50 miles in width and 30 miles long and containing four villages. This raised a storm of protest throughout Prussia, so that reluctance to take a step so clearly unpopular prevented the Council of Ambassadors from delimiting the boundary and ordering the transfer of the territory in question. The matter was still unsettled in 1924.

ALLIANCE FRANÇAISE, FÉDÉRATION DE L'. An association of societies founded for the purpose of encouraging in the United States and Canada the study and cultivation of the language, literature, art and history of France. Established in 1902, it increased its groups from 150 in 1916 to 226 in 1924. It published a Year Book (*Bulletin Officiel*) and a monthly, *L'Echo de la Fédération*, both in French. The Molière centenary was celebrated in 1922 and the Pasteur anniversary in 1923. A Congress of the French Language and Literature was organized in 1922 by the Fédération in Chicago. Every year during the period the Fédération brought one or more eminent men of letters from France as official lecturers to speak before the groups and affiliated societies, and organized lecture tours for other distinguished French travelers.

ALLIED DEBTS. See **FINANCE AND BANKING, Inter-Governmental Debts.**

ALLIN, CEPHAS DANIEL (1875-). A college professor, born at Clinton, Ont., and educated at the Universities of Toronto, Harvard, Berlin, and Oxford. After teaching successively in Leland Stanford Jr. University and in Queen's University (Canada), 1902-07, he entered the University of Minnesota in 1907 as instructor in political science. He became professor of public law in 1917. Besides contributions to scientific journals, he has written *The Early Federation Movement of Australia* (1907), *Annexation, Preferential Trade and Reciprocity* (1911), and *The Tariff Relations of the Australian Colonies* (1917).

ALLINSON, ANNE CROSBY EMERY (MRS. FRANCIS GREENLEAF ALLINSON (1871-). An American writer on the Greek and Latin classics (see VOL. I). She was acting dean of the Women's College at Brown University (1920-21). In her two books, *Greek Lands and Letters*, written with her husband (Boston, 1909), and *Roads from Rome* (New York, 1913), as well as in contributions to magazines, she describes, in an engaging way, her travels in Greece and Italy, recalling the literary and artistic associations of the places she visited and showing the influence of natural environment on literature.

ALLIS, EDWARD PHELPS (1851-). An American manufacturer and zoologist, born in Milwaukee, Wis. He was educated at Delaware Literary Institute, Antioch College, and Massachusetts Institute of Technology. He founded and maintained for several years the Lake Laboratory at Milwaukee as a private research institution. Here he and his associates worked mainly on the anatomy and embryology of the vertebrate head. His work has been recognized by many of the leading foreign and American societies of which he is a member, and in addi-

tion he has received the Prix Lallemand (Paris), *Palme Académiques* (Paris), etc.

ALLISON, DAVID CLARK (1881). An American architect, born in Hookstown, Pa. He took special courses in architecture at the University of Pennsylvania and studied also in Paris. Beginning the practice of his profession in 1906, he moved in 1910 to Los Angeles, forming the firm of Allison and Allison. This firm designed a group of 12 buildings for the University of California and also several high school groups, an open-air Memorial Theatre at Santa Monica, and more than 150 school buildings in California and Arizona. During the War he was divisional representative of the American Red Cross with the American combat division on the British front in France.

ALLOYS. See **CHEMISTRY.**

ALSACE-LORRAINE. Since 1918, again the French departments of Bas-Rhin, Haut-Rhin, and Moselle. Area, 5605 square miles, population, in 1921, 1,709,749, as compared with 1,874,014 in 1910. According to the 1910 census, 1,634,280 were German-speaking and 204,262, French. The distribution by religions was Catholics, 1,428,343; Protestants, 408,274; Jews, 30,483. The falling off in population was accounted for in part by the loss of 45,000 men in the War and the emigration of from 75,000 to 118,000 German citizens during 1918-21. According to a 1923 estimate, Germans in the three departments numbered 70,434 unnaturalized, and 78,000 naturalized. Other foreign nationals numbered 60,300. The French-speaking population was on the increase through the return of large numbers of former residents. Principal cities with their populations in 1921 were Strassburg, 166,767 (178,891 in 1911); Mulhouse (Mulhausen), 98,393; Metz, 62,311; Sarreguemines, 14,318; Colmar, 42,255; Thionville, 13,410; Guebwiller, 11,520. After 1920, instruction was in French, a certain amount of time, however, being set off for religious instruction in German in certain Alsatian districts. The University of Strassburg was opened in 1919, and in 1921 had 2415 students.

Industry. Agriculture continued to engage the attention of a large proportion of the population. The leading crops were wheat, oats, rye, barley, sugar beets, hops, potatoes. The wine production in 1920 reached 725,000 hectoliters, valued at 124,000,000 francs. The economic importance of the departments to France, however, lay in their mineral wealth. In Alsace were to be found petroleum and great potash fields; in Lorraine, some of the greatest iron deposits in Europe. In fact, from Lorraine, Germany derived 75 per cent (21,000,000 long tons) of all the iron mined in the Empire. In 1921 the output had only reached 7,826,674 metric tons; yet it totaled more than half of the whole French yield. The state of the industry is indicated by the fact that only 8974 workers were employed in 1921 as compared with 17,237 in 1913. Coal, mined largely in that portion of the Saar Basin deposits which extends into Lorraine, yielded 3,795,262 tons in 1913 and 3,621,928 in 1921. In the potash mines of Alsace, whose acquisition made France the greatest producer in the world, 1,039,635 tons were mined in 1920 and 657,087 in 1921, as compared with 355,341 tons in 1913. Oil-fields, lying in the Bas-Rhin (Alsace) were the scene of extensive operations. In 1913, production was placed at 49,584 tons; in 1920, 54,909 tons; in

1921, 55,574 tons. The total for France and the colonies was only 60,000 tons. As a result of these natural resources the Lorraine was the seat of a great iron and steel industry. In 1921, pig iron produced was 1,447,000 tons, as compared with 3,460,000 tons in 1913; steel, in 1921, showed a production of 1,156,129 tons as compared with 22,260,000 tons in 1913. On the other hand, the textile industry was first in importance in Alsace, and by its addition it increased the number of spindles for the whole of France by 23 per cent. The railroad system ranked with the best in France; in 1919 there were 2228 kilometers of line. In 1921, too, there were 131 kilometers of rivers open to navigation and 368 kilometers of canals.

Government. By decree, in 1918, the French Republic took over the administration of the provinces, and a High Commission, accompanied by a military force, was installed at Strassburg. To the High Commissioner were delegated the functions of supervising the activities of the three departments and of recommending appropriate legislation to the French Chambers during the extremely delicate transitional period. During 1919-23, some 400 decrees were prepared to hasten a greater administrative and legislative coordination. The introduction of the French code was to be only gradual. The first step was the installation of the French electoral and fiscal systems on Oct. 17, 1919. For a closer understanding between population and administration, a common regional council was erected with legislative powers concerning budgeting but with only consultative powers in all other matters. The French language was introduced in the schools, though religious instruction in German among Alsations was for the time being maintained. High Commissioners during the period were Georges Maringer (November, 1918, to April, 1919), Alexandre Millerand (to January, 1920), and Gabriel Alapetite (1920-).

History. In accordance with the terms of the Armistice, French troops entered Mülhausen on Nov. 15, 1918, and Strassburg on November 22. On December 5, the Alsace-Lorraine Diet, which had been erected by Germany in 1911 in response to a demand for popular government, converted itself into a national assembly and formally welcomed the return of the French administration. Its president declared: "*Le référendum est fait!*" and four days later the French President replied: "*Le plébiscite est fait!*" The occupation was thus complete, and the answer was given to that branch of Allied opinion, including the Socialists, which sought the holding of a plebiscite in the two provinces in order to invest the restoration with a legal sanction. A year later, in November, 1919, Alsations and Lorrainers, as Frenchmen, took part in the general election to the satisfaction of all the political parties. In the following years, the problems of administration concerned themselves wholly with the readjustments in finance, education, language, etc. It was inevitable, of course, that difficulties should arise. Alsace, in particular, had been essentially a German province, and the transitional period brought with it a derangement of habitual manners and modes of thought. There was grumbling over the substitution of a French bureaucracy for the German, over the tardy settlement of the language and religious questions, over the too zealous application of martial law, and the

inability of the government to convert the German currency into the French with consistency. It was not until June, 1922, that the French government was able to straighten out the financial tangle by providing funds through which the provinces' banks might convert the currency at the authorized rate, viz., 125 francs per mark. As for the religious and language questions, a compromise was arranged by which the elementary schools were permitted to maintain their denominational character and continue religious instruction in German, while no attempt was made to sever the connection between Church and State. It was made plain, however, that ultimately Church and State would be separated, as in the rest of France. In general, the French were treating these and all other problems with their characteristic tact, and evidence was not wanting that the process of assimilation was being lightly felt.

ALSTON, ROBERT COTTEN (1873-). An American lawyer, born in Barber County, Ala., and educated at the University of Alabama and the Atlanta Law School (Ga.). He began practicing in Atlanta in 1893 and until 1903 was a member of the firm of Tompkins and Alston. He was later a member of the firm of McDaniel, Alston and Black, and from 1911 to 1921 of the firm of Robert C. and Philip H. Alston. Some of the positions he has held are general counsel of the Southern Express Company, special counsel of the Atlantic Coast Line Railroad, and general attorney of the American Railway Express Company. He was president of the Georgia Bar Association (1913-14) and in 1907 became chancellor of the diocese of the Protestant Episcopal Church of Atlanta.

ALTHOFF, HENRY (1873-). An American Roman Catholic bishop, born in Aviston, Ill., and educated at St. Joseph's College, Teutopolis, Ill., St. Francis Solanus College, Quincy, Ill., and the University of Innsbruck, Austria. He was ordained priest in the Roman Catholic Church at Innsbruck in 1902. After serving as assistant and as pastor in Missouri and in Illinois, he was consecrated bishop at Belleville, Ill., in 1914.

ALTO ADIGE. See TIROL, GERMAN SOUTH.
ALTSCHULER, MODEST (1873-). A Russian orchestral conductor, born at Mogilev, Feb. 15, 1873. From 1886 to 1890 he was a pupil at the Moscow Conservatory, studying cello with Fitzenhagen and composition with Arensky, Safonov and Tanciev. After touring Russia with his own trio he came to New York, where in 1903 he organized the Russian Symphony Orchestra for the purpose of introducing the works of the then little known Russian composers. Among those whom he first introduced to American audiences were Rachmaninov, Tchaikovsky, Scriabin, Liadov, Vassilenko, Spendiaryov, and Konius. Players who made their American debut under his baton include Elman, Lhevinne, Rachmaninov, and Margaret Volavay. On Mar. 20, 1915, he gave the first complete performance anywhere of Scriabin's *Prométhée*, which requires the use of a specially constructed color-keyboard. From the very beginning Altschuler's concerts met with success. In 1920 the orchestra was disbanded, after accomplishing the object for which it was founded.

ALTSCHULER AWARD. See LABOR ARBITRATION.

ALUMINA CEMENT. See CEMENT.

ALUMINIUM, OR ALUMINUM. The world's output of aluminium in 1913 amounted to 78,093 metric tons; it reached a maximum of 200,328 metric tons in 1918. The United States generally produces from 35 per cent to 50 per cent of the world's output; at the same time it imports a certain amount, and in 1922 it reached a record total for metal, crude scrap and alloy, of 43,065,039 pounds. The world's production, which in 1921 had fallen to 76,494 tons, was estimated at 117,130 metric tons in 1922. The United States in 1922 produced 52,000 tons, against 28,750 in 1921. The value of new aluminium produced in the United States during 1923 was estimated by the United States Geological Survey at \$28,305,000, more than double the value produced in 1922 at domestic plants. Domestic aluminium was quoted at \$22 to \$23 during January, 1923, but by the end of April the price had reached \$27 per pound for a 99 per cent grade; it remained practically stationary at this point throughout the year. The 98 per cent grade was quoted \$.01 lower, and foreign aluminium was somewhat less expensive.

The expansion in the consumption of aluminium between 1914 and 1924 was largely due to the increase in the construction of automobiles. It was estimated that 25 per cent of the domestic aluminium produced in the United States was consumed by makers of automobiles, who used 72,700,000 pounds of the metal in 1922. In fact the consumption of aluminium followed quite closely the status of the automobile industry and the number of cars produced, as it was being employed more and more, not only in sheets for bodies and in small castings, but also in aluminium alloys for engine parts.

Duralumin connecting rods were employed in several motor car engines, while duralumin rims for motor car wheels also had been developed. Duralumin was the most important of the aluminium alloys which had been developed, and it also found application in airships and airplanes. It was an alloy of aluminium with copper, manganese, and magnesium, having a maximum specific gravity of 2.75 and a tensile strength of 55,000 pounds per square inch. This alloy proved very useful in Europe and was employed in the United States for the airship *Shenandoah* and other aircraft. Several plants were developed for the production of this metal, and by 1924 an important industry in the manufacture of duralumin shapes and forgings had been developed. See **MOTOR VEHICLES**.

Other uses of aluminium, in addition to household ware and various sorts of containers, were in bronze powder and in solid rubber tires for motor cars. There was also an increased use of aluminium foil for wrapping food and confectionery products. In steel metallurgy it was employed for oxidizing and for thermite purposes and for alloys. In 1923 there were important developments of silicon-aluminium alloys. Formerly silicon had been believed to be very harmful in the metal, and in all steps in mining the ore and in making aluminium, precautions were taken to remove silica, but it seemed from later research that bauxite of lower grade than had been considered usable could be employed in making the metal. The imports and exports for the years 1922 and 1923, given in the accompanying tables, indicated that the producers of aluminium in the United States were well able not only to take care of the domestic

demand but to supply a considerable amount to the rest of the world.

IMPORTS OF ALUMINIUM INTO THE UNITED STATES IN 1922 AND 1923

Class	Quantity (pounds)	
	1922	1923
Metal, crude and alloy ..	89,951,690	43,065,039
Manufactures of plates, sheets and bars	Not given	1,288,651
Hollow ware	Not given	648,933

EXPORTS OF ALUMINIUM FROM THE UNITED STATES IN 1922 AND 1923

Class	Quantity (pounds)	
	1922	1923
Ingot, scrap, and alloys ..	1,538,079	1,169,753
Plates, sheets, bars, strips and rods	2,808,941	4,369,918
Tubes, moldings, castings, and other shapes	353,847	442,370
Table, kitchen, and hospital utensils	1,255,743	1,175,659
Other manufactures	2,935,359	3,820,406

ALUMINIUM SALTS. See **CHEMISTRY** and **BAUXITE**.

ALVEAR, MARCELO T. DE (1868-). A president of the Argentine Republic, born at Buenos Aires, educated at the University of Buenos Aires, and elected to the National Congress in 1912. In 1916 he was appointed minister of Argentina to Paris, and in 1922 he was elected to the presidency. He was a member of the Radical party. His efforts while in Paris to foster good feeling between France and Argentina were greatly appreciated in both countries.

ALVORD, CLARENCE WALWORTH (1868-). American scholar and educator (see **VOL. I**). Since 1914 Professor Alvord has been one of the most prominent American historical scholars. He served as editor of the important *Illinois Centennial History* and the *Mississippi Valley Historical Review*. The latter under his management rapidly assumed a commanding place in American scholarship. His work, *The Mississippi Valley in British Politics* (1917), which received the Loubat Prize, was an excellent example of good technical research aided by the exercise of a real imaginative understanding and the power to envisage the whole field under treatment as a unit. It was another example of the gratifying work being done in the history of American sectionalism. Professor Alvord published *The Illinois Country* in 1919. In 1920 he took the chair of history at the University of Minnesota.

ALVORD, JOHN WATSON (1861-). An American engineer, born at Newton Centre, Mass., and educated at the Harvard University Preparatory School and at J. W. Hunt's Normal School, Wash. In his extensive career he has undertaken innumerable important engineering enterprises, the majority of them in the Middle West. He was associated with the Chicago Water Works (1880-84), Chicago Exposition (1890-93), Illinois and Michigan Canal (1897-1901), United States Steel Corporation, Gary, Ind. (1907), Illinois State Board of Natural Resources and Conservation (1918), etc. In 1918 he was appointed director of the American Society of Civil Engineers. He has contributed to periodicals articles on engineering, sewage disposal, and water works, to which he gave particular study. He is the author of *Relief and Floods* (1918).

ALWOOD, OLIN GOOD (1870-). An

American bishop, born at Delta, Ohio, and educated at Hartsville College, Ind. He was ordained in the ministry of the Church of the United Brethren in Christ (old constitution) in 1892. He held various pastorates in Michigan and Ohio (1892-1903), was presiding elder (1903-05), and became bishop in charge of the North District in 1905. He became editor of *The Christian Conservator* in 1921.

AMADE, ALBERT GERARD D' (1856-). A French general, born at Toulouse, and educated at La Flèche. He entered the army in 1876, and served as military attaché in China, with the British forces during the South African war, in London, and in 1907 as commander of the expeditionary force in Morocco. In the War he was in charge of the Army of the Alps till Italy came out on the side of the Allies; he was then given other commands at Lille and Douai. In 1915 he led the French forces at the Dardanelles. In May of that year he was recalled to France and sent on a military mission to Russia. He was inspector general at Lyons in 1916 and commandant of Rennes in 1917. See *WAR IN EUROPE, Western Front*.

AMATOL. See *EXPLOSIVES*.

AMBASSADORS, COUNCIL OF. See *PEACE CONFERENCE AND TREATIES*.

AMBLER, CHARLES HENRY (1876-). American college professor and historical student. He was born at New Mattamoras, Ohio, and studied at West Virginia and Wisconsin Universities. In 1908 he became professor of history at Randolph-Macon College, from which he went to the University of West Virginia in 1917. He has edited many valuable historical collections and has written monographs for the journals of learned societies. While Professor Ambler's work has been concerned primarily with problems in Virginian local history, he has succeeded in carrying over into his researches an understanding of the great importance which sectionalism played in the development of America; in this regard he is an important exponent of the school headed by Frederick J. Turner. His most important work is *Sectionalism in Virginia from 1777 to 1861* (1910). Other writings include *Thomas Ritchie, A Study in Virginia Politics* (1918) and *Life and Diary of John Floyd* (1918).

AMBROSE, PAUL (1868-). An American organist and composer, born at Hamilton, Ont., and educated in the public schools and at Hamilton Collegiate Institute. He studied piano with his father, a composer, and other teachers. He was organist in various New York churches from 1886-1917; in 1917 he became organist and choirmaster of the First Presbyterian Church of Trenton, N. J. He was professor of music in the New Jersey State schools, 1903-17, and was formerly engaged as soloist and accompanist. He is the composer of many sacred and secular songs, vocal duets, instrumental works, etc. He has held the vice-presidency of the Synthetic Guild of New York City and was president of the New Jersey section of the National Association of Organists, 1913-15.

AMBROSETTI, JUAN BAUTISTA (1865-1918). An Argentinian anthropologist. He was born in Gualeguay and educated at Buenos Aires. He was an early student and collector of archaeological specimens and at the age of 21 was made director of the Zoölogical Museum

of Parana. Among his publications are *Algunos Vasos Ceremoniales de la Region Colchaqu* (1902); *Antigüedad del Nuevo Mondo* (1903); *Los Grandes Hachas Ceremoniales de Patagonia* (1903), and *Apuntes sobre la Arqueología de la Puna de Atacama* (1904). His latest work, a contribution to the Pan-American Congress (1915-16), was *Los Vasos del Pekara de Tlacara*.

AMERICAN ASSOCIATIONS AND SOCIETIES. For organizations whose official titles begin with the word American, see under important descriptive word of the title, thus: *American Bar Association*. See *BAR ASSOCIATION, AMERICAN*; *American Legion*. See *LEGION, AMERICAN*; *American Library Association*. See *LIBRARY ASSOCIATION, AMERICAN*.

AMERICAN COUNCIL ON EDUCATION. See *EDUCATION IN THE UNITED STATES*.

AMERICAN EXPEDITIONARY FORCE. See *WAR IN EUROPE, Western Front*.

AMERICAN FARM BUREAU FEDERATION. See *AGRICULTURE*.

AMERICAN INDIANS. See *ETHNOGRAPHY*.

AMERICAN LAW INSTITUTE. See *LAW, PROGRESS OF THE*.

AMERICAN MUSEUM OF NATURAL HISTORY. See *EXPLORATION*.

AMERY, LEOPOLD C. M. STENNETT (1873-). A British politician (see *VOL. I*). During the War he served with the British army in France and later in Saloniki. He was reelected to Parliament in 1918. He was assistant secretary of the War Cabinet (1917); member of the staff of the War Council, Versailles, and of the staff of Secretary of State for War (1917-18); and Parliamentary Under-Secretary for the Colonies (1910-21).

AMES, JOSEPH SWEETMAN (1864-). An American physicist and writer (see *VOL. I*). In 1917 he was a member of the National Advisory Committee for Aeronautics, and later became chairman of the foreign service committee of the National Research Council which visited France and England for the purpose of investigating the organization and development of scientific activities in connection with warfare.

AMES, OAKES (1874-). An American botanist, born at East Eaton, Mass., and educated at Harvard University. Beginning as an assistant in botany and assistant director of the Botanical Gardens at Harvard in 1899, he became assistant professor of economic botany in 1915 and was director of the Botanical Gardens, 1910-22. He has been recognized as an authority on orchids, concerning which he has written a great deal. He has contributed to botanical periodicals and is the author of *Orchidaceæ* (1905-08) and *Notes on Philippine Orchids* (Boston, 1920).

AMHERST COLLEGE. A nonsectarian institution for men at Amherst, Mass., founded in 1821. The enrollment increased from 416 in 1914 to 561 in 1923, the faculty from 43 to 51 members, and the library from 107,800 to 130,000 volumes. The productive funds were increased from \$2,776,000 to \$6,500,000, and the income from \$224,800 to \$534,000. The George Daniel Olds professorship in economics was established in 1914; Edward C. Converse gave \$250,000 for a new library building for a memorial to his brother, James B. Converse; and Mrs. Rufus Pratt Lincoln endowed a professor-

ship in science in memory of her son, Rufus Tyler Lincoln, in 1916. The Amherst Memorial Fellowships were established in 1919 and the John Woodruff Simpson Fellowships and Lectureships in 1922. Important additions were made to the biological and geological collections. During three years beginning with 1920, experiments were made in conducting classes for workers in Holyoke and Springfield. The Amherst plan for alumni reading and study was initiated in 1922. The college celebrated its hundredth anniversary at commencement time, June, 1921. The alumni subscribed a centennial gift fund of \$3,000,000 for the college during the centennial year, and a series of publications, to be known as the Amherst Books, was started. Alexander Meiklejohn, Ph.D., LL.D., president, resigned in June, 1923, to take effect June, 1924, and was on leave of absence, 1923-24. President-elect and acting president for the year 1923-24, George Daniel Olds, LL.D.

AMIDON, SAMUEL BARKER (1863-). An American lawyer and banker, born at Perry, Ohio, and educated at the Geneva (Ohio) Normal School, Oberlin College and Hiram College. He began practicing in 1886, belonging successively to the firms of Amidon and Conly, and Amidon, Buckland, Hart and Porter. President or director of numerous banks and business concerns, he was also a member of the Democratic State Committee of Kansas from 1902 to 1904 and was appointed to the Democratic National Committee in 1917. He became vice-chairman of the latter in 1919, as well as assistant to the Attorney-General of the United States in the prosecution of the I. W. W. cases in Kansas.

AMMONIA. See CHEMISTRY; CHEMISTRY, ORGANIC; COKE; EXPLOSIVES.

AMMONS, ELIAS MILTON (1860-). A governor of Colorado (1913-15). He was born in Macon County, N. C., and educated at the East Denver High School. He worked at various odd jobs during his boyhood and later joined the staff of the *Denver Times*. Subsequently he went into ranching and in 1890 entered politics as clerk of the District Court of Douglas County, Colo. After holding several political offices, he was elected governor of Colorado in 1913. He did much for the advancement of agriculture and agricultural education in that State.

AMMUNITION. See ORDNANCE; ARTILLERY; SMALL ARMS.

AMUNDSEN, ROALD (1872-). A Norwegian explorer (see VOL. I). In 1918 he started in the *Maud* from Norway to begin his drift across the Arctic Ocean. By July, 1920, he had completed the northeast passage and had landed at Nome, Alaska. Subsequently the trip by boat was abandoned and in June, a flight to the North Pole was arranged; but this also ended in failure. See POLAR RESEARCH.

ANÆMIA. Between 1914 and 1924 progress in the relief of incurable primary anæmias by surgical intervention, especially by the removal of the spleen, was considerably practised. Hundreds of such operations were performed. The removal of the organ is not followed by injurious after-effects, and the operation is not especially hazardous. Usually there is reason to suspect that the anæmia is due to some disease of the spleen, but in these pernicious

forms of primary anæmia the cause is often quite obscure; the spleen is then removed as a last resort. Another surgical resource now much used in these cases is repeated transfusion of blood and the two may be combined. There is even a third surgical possibility, the removal of any focus of suppuration present in the body of one of these patients, as infected teeth or tonsils; for it may be that from some such apparently insignificant lesion the morbid blood state has taken its origin, at least in part. Only a few years ago the prophecy that pernicious anæmia would come under the head of a surgical disease would have sounded highly fanciful. It is too much to claim that a disease hitherto regarded as incurable can be radically cured by surgical means, when we are still ignorant of its exact causation, but many patients have shown improvement and have obtained a new lease of life from such treatment. Only time can decide the question of its value finally.

ANATOMY. See ZOOLOGY.

ANCIENT MAN. See ANTHROPOLOGY.

ANDAMANESE. See ETNOGRAPHY.

ANDERSEN, HENDRIK CHRISTIAN (1872-). An American sculptor, born in Bergen, Norway. He studied art and architecture in Boston, Paris, Naples, and Rome. Andersen has also distinguished himself as the author of *The Creation of a World Centre of Communication*, which contains a detailed plan for the founding of a monumental city devoted to human progress; a second volume enumerates the legalizing and the economic advantages of a world centre. He devoted nine years to this work and succeeded in enlisting the interest of the rulers of leading European countries and the United States in his project, but just about this time the War broke out. He was also founder of the World Conscience Society. His leading works in sculpture include "The Fountain of Life," "The Fountain of Immortality," "Jacob Wrestling with the Angel," "Study of an Athlete," and busts, medallions, and portraits of Pope Benedictus XV.

ANDERSON, ALBERT BARNES (1857-). An American judge, born near Zionsville, Ind., and educated at Wabash College. He was admitted to the bar in 1881. In 1902 he was appointed United States district judge of the District of Indiana. He presided at the trial of the so-called dynamite conspiracy case at Indianapolis in 1912. In 1919 he had charge of the case against the United Mine Workers of America. Basing his decision on the Lever Act, he issued an injunction against the miners' officials, demanding that the strike order be rescinded. The legality of this injunction was questioned, but the miners' officials gave in.

ANDERSON, CARLOTTA ADELE (MRS. J. SCOTT ANDERSON) (1876-). An American educator, specially interested in the Montessori method and in the instruction of the deaf and dumb. She was born in New York City, and studied at various colleges and universities, among them the Wright Humason School for oral teaching of the deaf, and Teachers College, Columbia University. She studied the Montessori method in Rome. Herself a teacher of the deaf for some years, she was from 1901 to 1916 the owner of oral schools for the deaf and of teacher-training schools in New York and Pennsylvania. For many years, too, she interested

herself in introducing the Montessori method in the public schools. She was in charge of training teachers of the deaf at the New Jersey State Normal School at Trenton (1918-21). She was United States delegate to the third International Congress on Home Education at Brussels in 1910 and was general secretary of the fourth International Congress.

ANDERSON, CHANDLER PARSONS (1866-). An American lawyer, born at Lakeville, Conn., and educated at Yale University and the Harvard Law School. He was admitted to the bar in 1891 and soon attained prominence in the field of international law. In 1896-97 he was secretary for the United States and Great Britain of the Bering Sea Claims Commission, and in the following year secretary for the United States of the Joint High Commission with Great Britain for the settlement of Canadian questions. He was counsel in various boundary disputes, notably those of Alaska (1903), Passamaquoddy Bay (1909), Costa Rica and Panama (1913-14), Guatemala and Honduras (1918), and Nicaragua and Honduras (1920). From 1905 to 1909 he was special counsel for the Department of State under Secretary Root, and the following year under Secretary Knox, in the negotiation of treaties with Great Britain concerning British North America. He has also been United States agent in the North Atlantic Coast fisheries arbitration at The Hague in 1910, counselor to the Department of State (1910-13), United States arbitrator in the British-American pecuniary claims arbitration (1913), legal adviser for the American embassies and legations in Europe on questions of American interests growing out of the War, and for the Department of State (1914-15), counsel on international questions for the United States War Industries Board (1917-18), counsel for the International Committee of the Red Cross Societies in France (1919), United States arbitrator in the American-Norwegian Shipping Claims Arbitration (1921), and United States legal expert for the Washington Conference (1921-22).

ANDERSON, DICE ROBINS (1880-). An American college president, born at Charlottesville, Va., and educated at Randolph-Macon College and the University of Chicago. After teaching in various colleges and academies, he was president of Willie Halsell College, Vinita, Okla. (1906-7). He was instructor in history in the University of Chicago (1908-9), professor of history and political science (1909-19), and professor of economics and political science and director of the School of Business Administration (1919) in Richmond College, Va. In 1920 he became president of Randolph-Macon Woman's College. He is author of *William Branch Giles, a Study in the Politics of Virginia and the Nation, 1790-1815* (1914), and is editor of the *Richmond College Historical Papers* (1915, 1916, 1917).

ANDERSON, EDWIN HATFIELD (1861-). An American librarian (see VOL. I). As director of the New York Public Library, Mr. Anderson has pressed forward the perfection of organization and administrative methods which has been all the more essential because of the unprecedented increase in the use of the different departments and the limited accommodations of the Library. He was president of the New York Library Association in 1914.

ANDERSON, HENRY WATKINS (1870-). An American lawyer, born in Dinwiddie County, Va., and educated at Washington and Lee University. He began the practice of law in Richmond, Va., in 1898, and three years later became a member of the firm of Mumford, Hunton, Williams and Anderson. He has been president of the Richmond-Washington Highway Corporation, vice-president and general counsel of the Atlantic Life Insurance Company. In 1912 he was the reorganizer of the International and Great Northern Railroad Company of Texas, and its general counsel from 1912 to 1914. In 1921 he was appointed trustee by the United States government for the Armour and Swift interests in the Stockyards. During the War he engaged in Red Cross work in the Balkans and received decorations from many foreign governments.

ANDERSON, ISABEL (MRS. LARZ ANDERSON) (1876-). An American author, wife of the sometime Minister to Belgium and Ambassador to Japan. She was born in Boston, Mass., and educated in private schools. She is author of stories for children and reminiscences of travel and diplomatic and social life, written in a lively and entertaining manner. Her works include *Captain Ginger's Fairy* (Boston, 1910), *Captain Ginger's Playmates* (Boston and Philadelphia, 1911; translated into French and German, 1911), *Every Boy and Other Children's Plays* (New York, 1914), *The Spell of Japan* (Boston, 1914), *The Spell of Belgium* (Boston, 1915), *Presidents and Pres* (Boston, 1920), *Topsy Turvy and the Gold Star* (Boston, 1920), *Polly the Pagan* (Boston, 1922). She has also contributed to periodicals. During the War she served on several relief committees and in French and Belgian front line hospitals. She has been decorated by the Japanese, Belgian, French, and American governments.

ANDERSON, JOHN FISHER (1873-). An American physician born at Fredericksburg, Va. (see VOL. I). Since Jan. 1, 1918, Dr. Anderson has been director of the research and biological laboratories of E. R. Squibb and Sons, New Brunswick, N. J. He was co-editor of the United States *Dispensatory*, 20th ed. (1918), and was professor of hygiene at Rutgers College.

ANDERSON, KARL (1874-). An American painter and illustrator, brother of Sherwood Anderson, the novelist. He was born at Oxford, Ohio, and educated at the Art Institute of Chicago and in Paris. He began his career as an illustrator and writer but turned to painting and soon achieved distinction for the beauty of his colors and the imaginative quality of his pictures, which were exhibited in galleries both in Europe and America and won numerous prizes. Among his best known works are "The Idlers" (Art Institute of Chicago), "Sisters" (City Museum, St. Louis), "Apple Gatherers" (Cleveland Museum), and "The Heirloom" (Pennsylvania Academy, Philadelphia).

ANDERSON, PAUL LEWIS (1880-). An American expert in pictorial photography, born at Trenton, N. J. He studied electrical engineering at Lehigh University and from 1901 to 1907 held engineering positions in various electrical companies. He founded the Struss-Anderson Laboratories for the manufacture of kalogen, a photographic developer which he

originated. His photographs have been exhibited abroad and in this country. He is the author of some excellent textbooks in photography, *Pictorial Landscape Photography* (1914), *Pictorial Photography, Its Principles and Practice* (1917), and *The Fine Art of Photography* (1919).

ANDERSON, PIERCE (1870-). An American architect, born in Oswego, N. Y. He graduated from Harvard in 1892 and took post-graduate courses at Johns Hopkins and Paris. He was with D. H. Burnham and Company and their successors from 1900 to 1917, and from the latter year he was a member of the firm of Graham, Anderson, Probst, and White. In 1912 he was appointed to membership in the Federal Commission of Fine Arts. He was chairman of the Central Department of the Military Training Camps Association.

ANDERSON, SHERWOOD (1875-). A prominent American author. He was born in Camden, Ohio, and was educated in the public schools. He then engaged in both business and newspaper work. From 1916 to 1923 he published four novels, three collections of stories, and a volume of poems. His writings were hailed as being among the most significant works of the new American novelists, and with the publication of *Winesburg, Ohio* (1919), he was immediately accorded popular recognition. This collection of portraits and short narratives, concerned with the characters of a typical Mid West town, is a book of the highest order. The plain American figures in it are handled with tenderness; a loving sympathy is displayed for their real spiritual lives, although they happen to be cramped and twisted underneath the drab exterior of commonplace persons and existences. Mr. Anderson's thesis is not leveled at the village, for his works are neither provincial nor regional, as it is against the whole character of the contemporary life with its bustle, its garishness, and its want of satisfying aspiration. His *Triumph of the Egg* (1921), also a volume of short stories, catches up the theme and manner of the earlier work, only with a more perceptible incisiveness of diction and a more rounded narrative art. These two books are, artistically, the best of Mr. Anderson's work.

In his novels, his vague, mystical, still adolescent reveries and his romantic wonder are given too free a play, with the result that scenes and characters very often overstep the probable *Windy McPherson's Son* (1916), *Marching Men* (1917), and *Poor White* (1920), all display the same preoccupations; they are concerned with rather inarticulate, restless young men who rebel against the confinement of their native villages and plunge into the life of the larger cities, only in the end to be thwarted in their quest for real happiness. Mr. Anderson fumbles a little too much with theme and character. There is also a good deal of tactless though never really objectionable writing. In *Many Marriages* (1923), Mr. Anderson's faults and virtues stand out conspicuously. The story is loosely constructed and highly improbable in incident; its mystical symbols very often cloud rather than clarify its issues; and yet it is a work that touches depths rarely plumbed before. It proves Mr. Anderson a great artist although his art is still imperfectly formed. His other works include *Mid-American Chants* (1918), a volume

of poems, and *Horses and Men* (1923), a collection of stories.

ANDERSON, WILLIAM FRANKLIN (1860-). A Methodist Episcopal bishop, born at Morgantown, W. Va., and educated at West Virginia University, Ohio Wesleyan University, Drew Theological Seminary, and New York University. He was ordained in the Methodist ministry in 1887. After holding several pastorates and offices on the Board of Education of the Methodist Episcopal Church, he was elected bishop in 1908. In 1914-18 he traveled widely as official supervisor of Methodist missions in Europe and Africa. During the War he served on the Committee of Emergency and Reconstruction of the Methodist Episcopal Church in Europe and in the Army Y. M. C. A. He was delegate of the Methodist Episcopal Church to the English and Irish Wesleyan Conferences in 1918 and 1919 respectively and fraternal delegate from the Federal Council of Churches of Christ in America to the Assemblée Générale du Protestantisme Français in Lyons, France. In 1922 he was decorated by the French government. He is author of *The Compulsion of Love* (1904) and *The Challenge of To-day* (1915).

ANDERSON, WILLIAM HAMILTON (1874-). An American temperance worker, born at Carlinville, Ill., and educated at Blackburn College, Carlinville, and the University of Michigan. After teaching school and practicing law, he became attorney of the Anti-Saloon League of Illinois in 1900 and was State superintendent of the Illinois League, 1900-06. This determined the trend of his whole subsequent life. Beginning in Illinois, he later held positions in the Anti-Saloon Leagues of New York and Maryland and in 1914 was elected general superintendent of the Anti-Saloon League of New York; at the same time he held various offices on the Board of Temperance of the Methodist Episcopal Church, in the Anti-Saloon League of America, and in the World League Against Alcoholism. Besides articles contributed to various periodicals, he is the author of *The Church in Action against the Saloon* (Westerville, Ohio, 1906; revised edition, 1910) and *The "Yonkers Plan" for Prohibition Enforcement* (Westerville, 1921).

ANDLER, CHARLES (1866-). A French professor. After his graduation from the Sorbonne he devoted himself to German philosophy and literature. At the outbreak of the War he had gathered around him in the University of Paris quite a group of young *Germanistes français*, whose object it was to bring about an intellectual *rapprochement* between France and Germany. He had a six-volume critical biography of Nietzsche in press, but the War put off its publication until 1919. The first four volumes, *Les Précurseurs de Nietzsche, La Jeunesse de Nietzsche, Nietzsche et le Pessimisme Esthétique, and Nietzsche et le Transformisme Intellectuel*, have now been published, and the two final volumes, *La Maturité de Nietzsche and La Dernière Philosophie de Nietzsche: le Renouveau de Toutes les Valeurs*, were in preparation in 1924. They portray the German philosopher as an opponent of modern Prussianism and essentially a French genius nourished by the work of the French psychological moralists like Montaigne, Pascal, La Rochefoucauld, and Stendhal. During the war Professor Andler published four volumes on the

rise and menace of the Pan-Germanist movement. He also wrote a volume on *La Philosophie de la Nature dans Kant* and a history of contemporary socialism in Germany.

ANDORRA. A semi-independent republic in the Eastern Pyrenees between the French department of Ariège and Catalonia in Spain. Its total area is 191 square miles; its population at the latest count available in 1924, 5231, scattered among 30 villages, the largest of which is the capital, Andorra la Vella. It is ruled jointly by the Bishop of Urgel and the French Republic, which maintains a permanent delegate in the country. Both authorities receive a biennial due from the native government. The excellent pasture land of the valley in which the republic is located furnishes the livelihood of its inhabitants. Coarse cloth is made from the wool of the flocks, some of which is exported. Grains are imported from France. The projected trans-Pyrenean railway was to pass within a few miles of the frontier and thus facilitate communications with the outside world. In 1924 communications were maintained by means of wagon-road with both Spain and France. Catalan is spoken by the natives, who embrace Catholicism. French and Spanish currency are both in use, though the French exert a predominant influence.

ANDRASSY, JULIUS (1860-). A Hungarian statesman (see VOL. I). In 1915 he urged the making of peace and an extension of the franchise in Hungary. As Foreign Minister, in 1918, he declared the alliance with Germany dissolved and tried to conclude a separate peace. He retired from office in the same year, but was returned in 1920 to the National Assembly as non-partisan delegate. He subsequently became leader of the Christian National party. His later works include, in Hungarian and German, *Wer Hat den Krieg Verbrochen? Interessensolidarität des Deutschlands und Ungarns*, and *Diplomatik und Weltkrieg*.

ANDRÉEV, LEONID NIKOLAEVITCH (1871-1919). A Russian writer and novelist (see VOL. I). The last years of Andréev's life formed a tragedy whose bitter pathos he alone could have expressed adequately. Idealist and rebel, he lived to see the Russian Revolution, the long-predicted cataclysm to which so many hopes had been pinned, but he saw it evolve in a direction contrary to his aspirations. Unlike his friend and fellow reformer, Maxim Gorki, who accepted the Bolshevik revolution as a fact and devoted his energies to saving its intellectual heritage from the old régime from destruction, Andréev could not make peace with the new order. He retired to a villa in Finland and addressed manifestoes to the world at large against the excesses of the Bolsheviks. Ironically enough, these writings were used as grist in the interventionist propaganda of the reactionary counter-revolutionists, whom Andréev hated as bitterly as he did the Bolsheviks. His death, on Sept. 12, 1919, was largely the result of his mental anguish over the Russian débâcle; for his social sympathies were as serious as only a Russian idealist's and mystic's could be. Aside from his political writings, Andréev published little after 1914. A play, *The Sorrows of Belgium*, was written at the beginning of the War to celebrate the heroism of the Belgians against the invaders.

It was produced in the United States, and so were the earlier plays, *The Life of Man* (1917), *The Rape of the Sabine Women* (1922), *He Who Gets Slapped* (1922) and *Anathema* (1923).

ANDRESS, JAMES MACE (1881-). An American psychologist and author of works on physical education, born at Chesaning, Mich., and educated at the Michigan State Normal College, the University of Chicago, Harvard University, and Clark University. He was instructor in history and education at Manchester College (Ind.), 1906-07, and head of the department of psychology and school hygiene at the State Normal School, Worcester, Mass., 1908-15, and became head of the department of psychology and child study, Boston Normal School in 1915. He was special lecturer on the history of education and on health education in various institutions, and in 1920 he was special agent of the bureau of education and taught at Chautauqua Institution, N. Y. He is author of *Johann Gottfried Herder as an Educator* (1916); *Teaching Hygiene in the Grades* (1918); *Health Education in Rural Schools* (1919); *Rosy Cheeks and Strong Heart*, in collaboration with Annie Turner Andress (1920) and *Suggestions for a Programme of Health Teaching in the Elementary Schools*, with M. C. Bragg (1921).

ANDREW, A (BRAM) PIATT, JR. (1873-). An American economist and public official (see VOL. I). During the War he served first with the French and later with the American forces (1914-1919) and organized and directed American Field Service with the French army. He subsequently received the Croix de Guerre and the D. S. M. (1919) and became Chevalier de la Légion d'Honneur (1917).

ANDREWS, ARTHUR IRVING (1878-). An American college professor born in Providence, R. I., and educated at Brown University, the University of Wisconsin, and Harvard University. He was professor of history and public law at Tufts College (1912-20) and professor of diplomacy at Charles University, Prague (1921). He has contributed to the *American Journal of International Law*, *Historical Outlook*, *Science Review*, etc.

ANDREWS, AVERY DE LANO (1864-). American lawyer, capitalist, and soldier, born in Massena, N. Y. A graduate of the United States Military Academy in 1886. He received his law education at George Washington University and the New York Law School and was admitted to the New York Bar in 1891. He soon attained prominence as a corporation lawyer, and played an important part in the activities of large corporate industries. He was an officer or director of the General Asphalt Company, the Uintah Railway Company, the Mexican Eagle Petroleum Company, and several banks. He was a staff officer in the Spanish-American War and saw service in France (November, 1917-May, 1919), as a staff member attached to General Headquarters. In 1918 he was made a brigadier-general. The United States, France, Belgium, and Italy decorated him. He was police commissioner of New York City, 1895-98.

ANDREWS, CHARLES McLEAN (1863-). An American historian and college professor (see VOL. I). Professor Andrews continued his work in the interpretation of colonial institutions; his *Boston Merchants and the Nonimportation Movement* (1917), *Fathers of New*

England (1919), and *Colonial Folkways* (1919) were of particular importance. The last-named, written for the *Chronicles of America* series, is a kindly and understanding study and constitutes a real contribution to American belles lettres. In 1921 he edited with his wife *The Journal of a Lady of Quality* and in 1923 published *British Colonial Policy and the American Revolution*.

ANDREWS, CHARLTON (1878-). American author and teacher, born at Connersville, Ind., and educated at De Pauw University and Harvard. Formerly he did newspaper work and taught and lectured in English at various schools. He was on the editorial staff of the *New York Tribune* (1914). He has contributed to many magazines and is the author of *The Drama To-day* (Philadelphia and London, 1903), *The Technique of Play Writing* (1915), and several plays.

ANDREWS, FANNIE FERN (PHILLIPS) (?-). An American lecturer, social worker, and writer, born at Margaretville, N. S., and educated at the Salem (Mass.) Normal School, Radcliffe College, and Harvard Summer School. She is known as a lecturer on education in Europe and America, as secretary and organizer of the American School Citizenship League, and as a member of the advisory council of the Institute of International Education and the International Peace Bureau (Berne, Switzerland), etc. She was delegate to the International Conference on Education in 1914 and represented the United States Bureau of Education at Paris during the Peace Conference. Her works include *The United States and the World* (1918), *The World Family* (1918), *The War—What Should Be Said about it in the Schools?* (Boston, 1914), *Central Organization for a Durable Peace* (Boston, 1916), *Freedom of the Seas* (The Hague, 1917), and *A Course in Foreign Relations*, prepared for the Army Education Commission (Paris, 1919).

ANDREWS, FRANK (1872-). An American statistician, born at New Albany, Ind. He graduated from Johns Hopkins University in 1893 and took post-graduate courses in economics in that university. Until 1900 he was a teacher in the public schools of Maryland and Pennsylvania and in 1902-3 was employed in the United States Navy Department. From 1903 to 1914 he was assistant at the Bureau of Statistics for the United States Department of Agriculture, and from 1914, chief of the Division of Crop Records of this Bureau. He was a member of several economic societies and the author of bulletins on the marketing of crops, statistics of sugar, etc. In 1914 he became a member of the United States Crop Reporting Board.

ANDREWS, IRENE OSGOOD (MRS. JOHN B. ANDREWS) (1879-). An American writer on problems of women in industry. She was born at Big Rapids, Mich., and educated at the School of Philanthropy in New York and the University of Wisconsin. She began her career as agent for the Associated Charities at Minneapolis, Minn., and in 1906 was appointed special agent for relief work in the American Red Cross in San Francisco, and factory inspector in Wisconsin. She was head resident of the Northwestern University Settlement, Chicago, in 1907. She became assistant secretary of the American Association for Labor Legislation in 1908 and a member of the Y. W.

C. A. National Industrial Commission to Europe (1918). She is author of *Minimum Wage Legislation, Working Women in Tanneries, Irregular Employment and the Living Wage for Women, The Economic Effects of the War upon Women and Children in Great Britain* (Oxford, 1918, 1921; reprinted by the Carnegie Endowment for International Peace, Washington, D. C.), and of contributions to the *Legislative Review*.

ANDREWS, JOHN BERTRAM (1880-). An American economist, born at South Wayne, Wis. He was educated at the University of Wisconsin and Dartmouth College. After teaching economics at both of these institutions, he founded in 1911 the *American Labor Legislation Review* with the purpose of recording advances in social reform. During the 10 years 1914-24, he served on various committees and organizations devoted to labor and industrial problems. In 1921 he was called by President Harding to serve on the Unemployment Conference. He was a member of the secretariat to the League of Nations' first official International Labor Conference in Washington. With Prof. John R. Commons he was the author of *Principles of Labor Legislation* (1916) and *History of Labor in the United States* (1918). He was also associate editor of *Documentary History of American Industrial Society* in 1910 and has written some United States government reports on occupational diseases.

ANDREWS, ROY CHAPMAN (1884-). An American naturalist and author, associate curator of mammals of the Eastern Hemisphere at the American Museum of Natural History, New York. He was born at Beloit, Wis., and educated at Beloit College and Columbia University. In 1908 he traveled and made explorations in Alaska and was special naturalist with the U. S. S. *Albatross* in an expedition to Borneo and Celebes (1909-10). He explored Northern Korea, 1911-12, joined the Borden Alaska Expedition in 1913, and was leader of the three Asiatic expeditions of the American Museum of Natural History, first to Tibet, Southwest China, and Borneo (1916-17); then to northern China and outer Mongolia (1919), and finally to Central Asia (1921-26?). In 1918 he was in the intelligence service in China. He is author of *Whale Hunting with Gun and Camera* (Chicago, 1916); *Camps and Trails in China*, with Mrs. Yvette Borup Andrews (Chicago, 1918); *Across Mongolian Plains* (Chicago, 1921), and the American Museum of Natural History publications, *The California Gray Whale*, with Hermann von W. Sehulte (1914) and *The Sei Whale* (1916).

ANET, CLAUDE (1866-). The pseudonym of Jean Schopfel, a French novelist and essayist. His novel *Quand la Terre Trembla* (1921) is a good naturalistic reproduction of the people's emotions during the War. His other works include *Les Roses d'Espahan* (1907); *La Révolution Russe* (1917); *Les 144 Quatrains d'Omar Khayyam* (1914); *Ariane, Jeune Fille Russe* (1920); *Petite Ville* (1921), and *L'Amour en Russie* (1922).

ANGELL, JAMES ROWLAND (1869-). An American psychologist and educator (see Vol. I). He was the Sorbonne exchange lecturer for 1915. On America's entry into the War he became a member of the Psychology

Committee of the National Research Council and was assigned by the adjutant-general's office to the work of classification of personnel in the army. He was chairman of the National Research Council (1919-1920) and president of the Carnegie Corporation (1920). In 1921 he was chosen president of Yale University. He published in 1918 *An Introduction to Psychology*.

ANGELL, NORMAN. See LOVE, RALPH N. ANGELL.

ANGINA PECTORIS. Not a little has been learned of this condition in the years 1914-24. It is not infrequently a consequence of remote syphilis and of imperfect treatment of the latter in its early stages. While it bears all the earmarks of a degenerative and destructive affection it has been found amenable, even when well advanced, to the operation of division of the sympathetic nerve, and apparent cures of desperate cases by Jonnesco and other surgeons are on record.

ANGLICAN CHURCH. See ENGLAND, CHURCH OF.

ANGLIN, MARGARET (1878-). An American actress born in Ottawa (see VOL. I). She took leading rôles in *The Trial of Joan of Arc* (1921), *Electra* and *Medea* (New York, 1918). It was in the Athenian tragedies particularly that she excelled. Both critics and audiences received her Shakespearean productions in 1914 with warm approbation. Miss Anglin has been described as having the courage of the grand style, although her most distinctive gift is for high comedy, as in *Lady Wandermere's Fan*.

ANGLO-JAPANESE ALLIANCE. On Jan. 30, 1902, England and Japan concluded an alliance whereby the two Powers, "actuated solely by a desire to maintain the status quo and general peace in the extreme East," recognized the independence and territorial integrity of China and Korea and bound themselves to come to the assistance of each other in case more than one power joined in hostilities against either one. On Aug. 12, 1905, the treaty was renewed in a revised form, inasmuch as it provided that war with one power was to be sufficient cause for common action. It was to run for five years and thereafter until one year after either contracting power should have denounced it. Moreover, while the phrase of maintaining general peace was retained, nothing further was said about the maintenance of the status quo. The changes in the Far East, particularly the annexation of Korea by Japan, brought again a renewal and revision of the treaty in 1911. While the objects of the new pact were essentially the same as those of the treaty of 1905, an additional article was adopted which read, "Should either of the high contracting parties conclude a treaty of general arbitration with a third power, it is agreed that nothing in this agreement shall impose on such contracting party an obligation to go to war with the power with whom such an arbitration treaty is in force." This was inserted to exclude the United States from the list of powers with whom Great Britain might find herself at war as a result of the treaty.

The Anglo-Japanese Alliance had originally been formed against Russia, and it had been a factor in bringing about the Russo-Japanese War and Russia's defeat. After 1907, when an

understanding had been reached by Great Britain and Japan on one side and Russia on the other, Germany became the potential enemy, and a direct result of these developments was the withdrawal of the British squadron from the Far Eastern Waters to the North Sea. When the War broke out, Japan declared war on Germany "in accordance with the terms of the Anglo-Japanese Alliance." The ultimatum which Japan delivered to Germany on Aug. 9, 1914, contained, however, only terms which would have been equivalent to a surrender of German territory and rights in the Far East. This fact leaves open the question whether Japan would have declared war in case Germany had accepted the terms, or whether Japan was not, after all, more interested in eliminating a rival than in fulfilling the terms of the Alliance and protecting British possessions in Asia, notably India. While outwardly fulfilling her treaty obligations arising out of the Alliance, Japan in reality used the Alliance as a screen behind which she furthered her own aims in the Far East. The preoccupation of the Allies gave her a free hand. Occasional representations and protests from the Allies were of no avail. Primarily as a result of the Anglo-Japanese Alliance, the conclusion of the War found Japan, with the connivance of Great Britain, in a powerful position, from which she receded only after the Peace Conference.

In 1914 Great Britain and the United States signed the Peace Commission Treaty, which, strictly speaking, was not an arbitration treaty. Nevertheless, Sir Edward Grey, the English Foreign Secretary, notified the Japanese government that the British government would regard the treaty as a "general arbitration treaty" within the meaning of the exemption clause of the Alliance. The fact that this notification was kept secret until 1921 served to strengthen the impression that the Alliance would operate against any power whatsoever, and thus worked materially to the benefit of Japan. After Japan had eliminated in succession, by means of the Anglo-Japanese Alliance, Russia and Germany as competing powers in the Far East, the most serious obstacle to Japanese power in the eastern Pacific was the growing ascendancy of the United States. Aside from the question of Japanese immigration in western Pacific territories, which was in itself serious enough, Japanese and American interests came more and more into conflict in the Far East. For example, the United States stood for the "Open Door" in China, while Japan was the strongest protagonist of the policy of zones of interest in that country. It had been made clear to Japan that the Anglo-Japanese Alliance would not operate in case of a clash between Japan and the United States. Hence there appeared in Japan signs of coldness toward a continuation of the treaty with England. It was no mere coincidence that in 1916, simultaneously with vigorous demands in the Japanese press for abrogation of the Alliance, the Japanese government concluded a secret treaty with Russia for cooperation in the Far East, which would have superseded the pact with England had not the Russian Revolution occurred. (See JAPAN AND SIBERIA AND THE FAR EASTERN REPUBLIC.) Japan, thrown back on the Anglo-Japanese Alliance for the time being, concluded thereupon in 1917 the Lansing-Ishii Agreement, whereby she obtained

liberty of action in China, at least for the duration of the War. See JAPAN.

The period following on the Peace Conference witnessed further accord between Great Britain and the United States, and the two Powers began more and more to coöperate in all the main issues of world affairs. At the same time the points of conflict between Japan and the United States grew sharper. Japan was compelled under pressure from the Powers to forego a large part of her position on the Far Eastern mainland and, *nolens volens*, had to accept the Open Door policy in China. It became evident, moreover, that no full accord or alliance between Great Britain and the United States was possible while the Anglo-Japanese Alliance was in existence. As a matter of fact the Alliance had outlived its usefulness, since Japan would not be able to count on British assistance against her only possible rival. Hence demands were made in the press of both countries for the discontinuation of the treaty. When, therefore, after the lapse of the 10-year term the renewal of the Alliance came up for consideration in July, 1920, it was decided in accordance with the clause contained in the text of the 1911 treaty to let the Alliance run for another year. Meanwhile Great Britain desired to consult the Dominions, whose attitude toward Japan was akin to that of the United States. At the same time Great Britain and Japan discovered that the text of the 1911 treaty was "inconsistent" with the Covenant of the League of Nations and in a note apprised the League of this fact, promising that on the renewal of the treaty this inconsistency would be remedied. When after the lapse of the year no agreement had been reached as to a proper basis for renewal, the treaty was declared by mutual agreement in July, 1921, to remain in force for three months, and the League was informed that this automatic extension conflicted in no way with the note to the League of the preceding year. At the end of the stipulated three months the Washington Conference (q.v.) convened (November, 1921) and there treaties and agreements were concluded in consequence of which the Anglo-Japanese Alliance became completely obsolete. The Alliance was allowed to lapse in consequence of the Four Power Treaty. The Lansing-Ishii Agreement was superseded by the Nine Power Treaty of the Open Door in China. What actually took place was that Great Britain and the United States reached a complete accord as to the chief issues in the Pacific and that Japan, under pressure from the two English-speaking powers, had to make concessions and forego her liberty of action in the Far East. The British change of front from the Anglo-Japanese Alliance to co-operation with the United States had become a fact. In consequence of these events and of the American immigration legislation in 1924, Japan subsequently pursued a policy which indicated a desire to reach an agreement with Soviet Russia on Far Eastern questions, similar to that concluded with Imperial Russia in 1916.

ANGOLA, or PORTUGUESE WEST AFRICA. A Portuguese colony situated on the West coast of Africa, bounded on the North and East by the Belgian Congo, and on the South and East by Rhodesia and the Union of South Africa. It presents a coast-line of 1000 miles to the Atlantic and has an estimated area of 484,800 square miles. In 1914 the population was

placed at 2,124,361, which was considered too low. Later estimates gave Angola 4,119,000 souls, of whom all but some 30,000 whites, mostly Portuguese, were natives of Bantu-Negro stock. Loanda, the capital, situated on the coast, has an estimated population of 18,000. Other important towns are Cabinda, Ambriz, Novo Ridondo, Benguela, Mossamades, and Port Alexander. The chief products continued to be coffee, rubber, wax, sugar, vegetable-oils, cocoanuts, ivory, oxen, fish, and whale oil. The rubber industry steadily declined, with the result that the government applied itself to the encouragement of cotton and sugar-cane culture. The colony contained considerable quantities of copper, iron, petroleum, salt, and some gold, none of which was worked extensively. The trade, largely with Portugal and carried in Portuguese bottoms, consisted of imported textiles and exported rubber, coffee, dried fish, and whale oil. In 1921 these totaled 39,995,382 escudos for imports and 23,597,548 escudos for exports, both exclusive of the Congo. Communications were of course still in a primitive state. There were 818 miles of railway, 375 miles of which were purchased by the Portuguese government in 1918. The completion of the railroad out of Benguela, designed to tap the British copper region of Katanga, Belgian Congo, was under way in 1921. The removal of Germany from Africa as a result of the War left British influence dominant. Rivalry between British and German interests had been keen for the gaining of economic concessions and the Germans had been particularly active in southern Angola. German agents recruited native workers for transportation to the Otavi copper mines in German territory and thus gained the enmity of the Portuguese. During the War, border conflicts took place between German and Portuguese forces.

ANGORA GOVERNMENT. See TURKEY.

ANIMAL PSYCHOLOGY. In 1914 animal psychology was just emerging from the anecdotal stage and was fighting for the right to be regarded as a legitimate branch of experimental psychology. This right 10 years later had been achieved through the perfection of objective methods of control. Indeed, the technique of animal psychology, necessitating the study of external behavior without regard to states of consciousness, had a powerful repercussion on psychology proper (see BEHAVIORISM). Unfortunately, the development of an experimental technique did not bring the students of animal psychology much nearer the synthetic viewpoints for which they had all hoped. Many problems were attacked but few comprehensive theories discovered. The greatest amount of experimenting was done on habit formation, with white rats learning to pick their way in a maze. The topics treated included learning ability, distribution of effort, retention of motor habits, and transfer of training. While many hypotheses of learning ability were suggested, none stood the test of criticism. When the assumption of a conscious directive force was abandoned, the pleasure-pain explanation was attempted. But this was seen to prove nothing except that animals prefer pleasure to pain, when they have a choice between the two. As for the more complex sentiments, the experimental technique generally proved insufficient (*Psychological Bulletin*, 1921, vol. 15, p. 573). The theory of the con-

ditioned reflex formulated by the Russians, Bechterev and Pavlov, has not received any new developments. That certain reflexes, such as the salivating reflex in the case of dogs, can be made to function by conditions habitually associated with the adequate stimulus, was definitely established. But the theory cannot be used greatly to anticipate experience, although it does explain it after the fact.

Two other fruitful subjects of research were the study of tropisms and instincts among the lowest animals and the higher mental processes among animals most closely resembling man. The first seems by its nature to favor a mechanistic explanation and the second a conscious explanation. Jacques Loeb, in his two works, *The Organism*, considered as a whole from the physico-chemical standpoint, and *Tropisms*, forced movements and animal conduct, attempted to extend the physico-chemical explanation to the entire animal kingdom, man included. However, experiments with the lowly amoeba revealed an unexpected degree of complexity even in the movements of unicellular animals. Kepner and Edwards (*Journal of Experimental Zoology*, 1917, vol. xxiv, p. 381) find that the *Amoeba pelomyxa* has two types of feeding reactions, one to nonmoving objects which have no possibility of escape, the other to objects in motion, which may escape. Schaeffer (*Journal of Animal Behavior*, 1917, vol. vii, p. 220) points out that the ordinary amoeba can choose between digestible and nondigestible particles. He regards the movement of the particle as the most important condition of the feeding reaction. Glass particles are eaten if they are in motion but not otherwise. Numerous experiments with light waves led to no important conclusion as to the behavior of the lower animals, inasmuch as the light stimulus produces immediate reactions from the higher animals and from man. The mental life of primates was investigated by Robert M. Yerkes (*Behavior Monographs*, No. 12) and by Wolfgang Koehler (*Psychologische Forschung*, 1922, vol. i, p. 2). The latter developed an interesting support to the *Gestalt* theory of perception (see PERCEPTION) by showing that chimpanzees and apes react to the form of the stimulus rather than to any specific element of it. Henning (*Zeitschrift für Biologie*, 1919, vol. lxx, p. 1) has found that untrained dogs gave no reaction to odors without biological significance but could be trained to respond to any type of odor detectable by man. See INSTINCT.

Bibliography. Most of the discussion of animal psychology is scattered through the psychological and biological periodicals. Washburn's *The Animal Mind* continued as the standard textbook on the subject. For a popular exposition of animal psychology, consult the first section of McDougall's *Outline of Psychology*.

ANISFELD, BORIS ISAALEVICH (1879-). A Russian painter and scenic decorator. He was born at Bieltsy, Bessarabia, and received his chief artistic training in five years at the Odessa Art School. At the Academy of Petrograd he was allowed to develop independently. A series of South Russian landscapes brought his first artistic triumph at Petrograd and Paris in 1905. The same season saw his first scenic production, the "Marriage of Zobeide," which in its daring color schemes and original conception was epoch-making in Rus-

sian scenic art. It attracted the attention of Diaghilev, who employed him on the Russian ballet. (See PAINTING, section *Russia*.) Among other scenic triumphs were "Boris Godounov" (1908), "Ivan the Terrible" (1909), "Sadko" (1911), "Islamey," "The Preludes," "Egyptian Nights," and "La Reine Fiammette" (New York, 1918). This scenic work gave his easel and other paintings an increasingly imaginative character. The chief influence was undoubtedly Oriental art, and he is primarily a colorist, but he subordinates color and all else to constructive synthesis. Among his best known canvases are "Clouds on the Black Sea," "Alder Grove—Iver," and "Gray Day on the Neva"—landscapes; a series of still lifes; "The Blue Statue," "The Exodus," "Garden of Eden," "The Golden God," "Garden of the Hesperides," "Buddha and the Pomegranates." His portraits include several of himself, the singer Chaliapine and L. M. Wourgaft. He is represented in all important Russian museums and in Brooklyn and Buffalo. In 1917 he escaped through Siberia to the United States, where he held exhibitions in 1917 and 1924, and became an important factor in stage decoration.

ANNAM. See FRENCH INDO-CHINA.

ANNAPOLIS. See UNITED STATES NAVAL ACADEMY.

ANN ARBOR MUSIC FESTIVAL. See MUSIC, *Festivals*.

ANNUNZIO, GABRIELE D' (1864-). An Italian novelist and poet (see Vol. I). When the War broke out in 1914 he was in France, but he sent many messages to the Italian people urging them to join on the side of the Allies. He returned to Italy in 1915, and although 55 years of age he volunteered for active service. He took part in many torpedo and submarine raids, and later joined the flying force, and in August, 1918, flew over Vienna, but dropped pamphlets instead of bullets on the unfortified city. He was promoted to the rank of lieutenant-colonel. After the Armistice, his bitter denunciation of President Wilson and the Allied Powers was effective in straining relations between Italy and the American President, already upset by the dispute over Fiume. When D'Annunzio led an expedition into that city, many of his most ardent admirers fell away from him, but a large body of important Italian opinion supported him in his rôle of "Commandant" of Fiume, and many of the army and navy officers served loyally under him. For 15 months he reigned in Fiume, and refused to submit to the Italian government in enforcing the provisions of the Rapallo treaty. He was overcome by the government and obliged to leave Fiume in January, 1921. He settled at Gardone on the lake of Garda. Among his later writings are *Le Chèvrefeuille* (1914); *Per la più Grande Italia* (1915); *La Leda senza Cigno* (1916); *La Befra di Buccari* (1918); *La Riscossa* (1918), and *Notturmo* (1918).

ANSELL, SAMUEL TILDEN (1875-). An American lawyer, born at Coinjock, N. C., and educated at the United States Military Academy and the University of North Carolina. Beginning with the commission of second lieutenant in the infantry in 1899, he became major judge advocate in 1913, and brigadier general in 1917. He served with the civil government as prosecuting attorney in the Philippines (1909-11). By special assignment of the War Department, he was attorney before the Federal

courts of the United States for Porto Rico and the Philippines and acting judge advocate general of the United States of America (1917-18), for this work he was awarded the D. S. M. He inaugurated the movement which resulted in the reformation of the army court martial system. In 1919 he resigned from the army to practice law.

ANSPACHER, LOUIS KAUFMAN (1878-). An American dramatist and lecturer, born at Cincinnati, Ohio, and educated at the College of the City of New York and Columbia University. He was secular lecturer at Temple Emanuel, New York (1902-5), and became a member of the lecture staff of the League for Political Education of New York (1906), and of the Brooklyn Institute of Arts and Sciences (1908). Subsequently he was lecturer for the University Extension Centre, New York, and a member of the staff of the Civic Forum Lecture Bureau at its formation. He is the author of several successful plays which include *Tristan and Isolde* (New York, 1904), *Embarrassment of Riches* (New York, 1910), *Anne and the Archduke John* (1907), *The Woman of Impulse* (New York, 1909), *The Glass House* (1912), *The Washerwoman Duchess* (1913), *Our Children* (New York, 1915), *The Unchastened Woman* (New York, 1915), *That Day* (Los Angeles, 1917), *Madame Cécile* (1918), *The Rape of Belgium*, with Max Marcin (1918), *Daddalums* (London, 1920), *The Dancer*, in collaboration (New York, 1919), *All the King's Horses* (1920), and *The New House* (1921).

ANTARCTIC REGIONS. See POLAR RESEARCH

ANTHONY, ALFRED WILLIAMS (1860-). A leading American theologian, born in Providence, R. I., and educated at Brown University, the Cobb Divinity School, and the University of Berlin. He was ordained in the Free Baptist Ministry in 1885 and appointed pastor in Bangor, Me. (1885-8), professor of New Testament exegesis at the Cobb Divinity School (1890-1908), and professor of Christian literature and ethics at Bates College (1908-11). Since 1911 he has devoted himself chiefly to executive work in Baptist church affairs. Among his recent works are *The Conscience and Concessions* (1918) and *The Church in the Community* (1919).

ANTHONY, KATHERINE (SUSAN) (1877-). An American writer on feminism, born at Roseville, Ark., and educated at Peabody College for Teachers, Nashville, Tenn., the Universities of Heidelberg and Freiburg, Germany, and the University of Chicago. She was instructor in Wellesley College (1907-8) and did research work in economics for the Russell Sage Foundation, New York (1909-13). She is author of *Mothers Who Must Earn* (1914), *Feminism in Germany and Scandinavia* (1915), *Labor Laus of New York* (1917), and *Margaret Fuller—a Psychological Biography* (1920). She was author of the essay on "The Family" in *Civilization in the United States—an Inquiry by Thirty Americans* (1921) and editor of *The Endowment of Motherhood* (New York, 1920).

ANTHRACITE. See COAL.

ANTHRAX. This communicable disease, in the form known as malignant pustule or malignant carbuncle, came much before the public because of its transmission through infected horsehair shaving brushes. Ordinarily it is an

occupational disease which occurs in workers in rawhide, wool, horsehair, bristles, etc. During the past few years numerous cases have occurred especially in Pennsylvania, both in horsehair workers and tanners on the one hand and among the general public on the other, as a result of infection from the use of horsehair shaving brushes. As a consequence of these infections the Health Department of that State issued a ruling that all horsehair should be subjected to dry heat for 24 hours at 200°F., or for 2 hours to steam at 15 pounds pressure, and finally to continual boiling in water for 3 hours. The public has been repeatedly warned by health authorities against the use of cheap shaving brushes, but this warning is insufficient for the protection of the community; and in New York State a law was passed which became effective on Jan. 1, 1922, prohibiting the manufacture, sale and offering for sale of shaving brushes made of horsehair. The general decline in the use of the shaving brush in recent years must be set down as due in part to this possibility of contamination. In the larger exposed industries, as tanneries, the men are notably indifferent toward self-protection, and only a small proportion are directly exposed to contagion. Statistics have shown that about 10 per cent of those exposed will contract the disease, with a mortality of about 20 per cent. In the past 12 years 119 workers in the Pennsylvania tanneries have been infected.

ANTHROPOLOGY. The decade 1914-24 witnessed a series of important discoveries in biological anthropology bearing on human evolution and new interpretations of older finds. Among these Boule's *Les Hommes Fossiles* (1921) is a work of outstanding merit, while the English-speaking public found convenient summaries in A. L. Kroeber's *Anthropology* (1923), G. Elliot Smith's pamphlet on *Primitive Man* (1916), and H. F. Osborn's *Men of the Old Stone Age* (1914). It was generally admitted, largely as a result of A. Hrdlicka's critical inquiries, that the New World must be excluded as a possible centre of origin of the family Hominidae, and that southern Asia was the most likely place. Nevertheless, the Asiatic expedition organized by R. Andrews, with W. Granger serving as palæontologist, concentrated its attention on a region considerably to the north, in Mongolia, while the possibility of a European origin was suggested to Dr. Hrdlicka by his inspection of the Piltdown remains. At all events by far the fullest information came from Europe, where the Neanderthal type (*Homo neanderthalensis*) has been definitely established as a distinct species of man, very much lower morphologically than the Australian or Tasmanian.

This conclusion is based on a succession of finds which definitely rule out the older hypothesis of pathological deformation. The type is associated with the cultural subdivision of the Palæolithic known as Mousterian. Toward the end of 1921 a startling discovery was made in Broken Hill, Rhodesia, where for the first time human remains of archaic type were unearthed from African soil. Palæontologically, the associated fauna does not indicate great antiquity, but the skull itself has a tremendous development of brow-ridges suggestive of the Neanderthals. No complete description was available up to 1924, and some features, such as the close approximation to erect posture inferred

from the position of the *foramen magnum*, indicated important deviations from that species. (See G. G. MacCurdy, in *American Anthropologist*, 1922, p. 97 et seq.) On the other hand, fragments of two jaws found near Weimar in 1914 and since described in H. Virchow's *Die Menschlichen Skeletreste . . . von Ehringsdorf bei Weimar* are accepted as Neanderthaloid.

Respecting the much lower form represented by the Heidelberg jaw, found in 1907, there was no dissension. It was recognized as belonging to a member of the human family but of a species distinct from both recent and Neanderthal man. Some inclined to the view that it belongs to a separate genus, *Palaeoanthropus*. On the other hand, there is considerable dispute as to the interpretation of the Piltdown remains unearthed in 1912. The reconstructions of the cranium made by different investigators varied appreciably, and non-British students were strongly inclined to consider the jaw as that of a chimpanzee and unconnected with the skull. G. Elliot Smith, however, maintained that it is impossible to maintain this opinion when it is tested by examination of the actual remains instead of mere casts, because the mandible and its teeth are indisputably human. Since the same holds for the skull in far greater measure, the brain falling within the range of living races and displaying a marked overgrowth of what corresponds in position to the speech centres, Smith sees here a corroboration of his favorite theory that the brain led the way in human evolution. *Pithecanthropus erectus*, the ape-man of Trinil, Java, had not, up to the middle of 1924, received monographic treatment at the hands of its discoverer, Dr. E. Dubois. It is recognized as the lowest member known to date of the family Hominidæ. In 1923 Dr. Hrdlicka had access to the actual specimens and was reported to have evolved a new interpretation of the find.

The origin of the races now in existence was still enveloped in doubt, though the Cro-Magnon man of the Upper Palæolithic—tall, narrow-skulled, and broad-faced—was usually conceived as Caucasian and indeed was believed by some to survive in different parts of Europe, for example in Scotland. A female skeleton and that of a youth found in Grimaldi and roughly contemporaneous with the Cro-Magnon remains were sometimes conceived as Negroid, but the determination was not universally recognized, while evidence of a prehistoric Mongolian race seems to be lacking. On the other hand, a fossilized Australian skull, found in Talgai, Queensland, and supposed to be of considerable antiquity, was regarded by G. Elliot Smith and S. A. Smith as ancestral to the present aborigines. The only distinctive feature was the great size of the palate and teeth, especially the canines. As to the cause of racial differentiation, two suggestive hypotheses found some following. In his presidential address on *The Differentiation of Mankind into Racial Types*, A. Keith (British Association for the Advancement of Science, 1920) explains the evolution as the result of differences in the ductless glands. On the other hand, Eugen Fischer in the *Eduard Iahn Festschrift* and elsewhere propounds the view that man is a domesticated animal and hence naturally has developed variations on a considerable scale in the same directions as such species as horses, dogs, cattle. As a matter of fact, the very traits distinctive

of breeds of cattle, dogs, etc.—type of skull, hairiness, hair texture, size—are the criteria employed by anthropologists in their classifications.

A conservative statement on classifications, with brief summaries of older schemes, will be found in Kroeber's *Anthropolgy*. G. Elliot Smith, e.g. in *Primitive Man*, injects a genetic point of view into the problem. Appraising the Australian as the lowest type extant, he regards him as something of a survival of the primeval *Homo sapiens*; he is supposed to have become localized in India, leaving the pro-Dravidians there when he migrated to his historic home. The Negroids became segregated at a later period, and still later four stocks with less pigmentation evolved, the Mongolian, Alpine-Armenoid, Mediterranean, and Nordic. The Polynesians are interpreted as a Mediterranean and Armenoid mixture, which even affected the essentially Mongolian population of aboriginal America. The last of these propositions—the partly Polynesian affiliation of the Americans—is likewise championed by Von Luschan and R. B. Dixon. The latter, in his book on *The Racial History of Man*, advances, however, a far more radical position. Taking three cranial features, the cephalic index, height index, and nasal index, he bases a system of races on them alone, to the exclusion of such hitherto universally accepted features as pigmentation and hair texture. As a result he discovers proto-Negroid, as well as Mediterranean, Alpine, and Caspian, i.e. Nordic, strains in the American Indian population and arrives at equally startling conclusions for races of other regions. So far these have been met with reserve or skepticism by most writers. Certainly Boas's observations on the mutability of the cephalic index in successive generations of southern and eastern European immigrants into America and those on the change of the Russian index in the direction of dolichocephaly as a result of the famines (Alexis Ivanovsky, *American Journal of Physical Anthropology*, 1923, pp. 231-353) hardly tally with the assumption that this index expresses a profound biological verity. On the other hand, the attempt made by Dixon to consider the combination of traits in individual subjects, e.g. to regard the association of dolichocephaly, leptorhiny, and hypsicephaly, as distinctive of a separate strain in a population, rather than to define the whole group on the basis of statistical averages, is in accord with a widespread tendency among recent investigators. Thus, V. Lebzelter (*Mitteilungen der Anthropologischen Gesellschaft in Wien*, 1923, pp. 1-48) splits up his Serbian subjects into a Dinaric group with tall stature, dark hair, and broad heads; another strain with short stature, dark hair and broad heads, and so forth.

The War, which in some respects blighted scientific work, including that in anthropology, nevertheless stimulated research along anthropometric lines. Investigations were made on prisoners of war. Thus, F. G. Parsons in his *Anthropological Observations in German Prisoners of War* tested and confirmed the fundamental differences between northern and southern Germans. Highly suggestive are the conclusions of J. Czekanowski (*Bulletin et Mémoire de la Société d'Anthropologie*, 1920, pp. 48-69), who denied that the time-worn classification of European races into Nordic, Alpine, and Medi-

terranean is at all applicable to Eastern Europe. Thus, he finds at least four additional stocks in Poland alone, of which a short, mesocephalic group is said to represent the oldest element, while a tall, blond, drachycephalic type and an obsolescent short, fair and dolichocephalic variety are equally noteworthy. These observations have been partly paralleled in Russia.

A model study of a particular people, made from a morphological and genetic point of view, is furnished by F. Sarasin's *Anthropologie der Neu-Caledonier und Loyalty Insulaner* (1920). These aborigines are shown to have affiliations with the Australians and Tasmanians. The technique of anthropometry found detailed treatment in Rudolf Martin's monumental *Lehrbuch der Anthropologie* (1914), of which a second edition was in process of preparation in 1924. Besides this classic there are several lesser treatises, such as Fabio Frassetto's *Lezioni di Antropologia* and A. Hrdlicka's *Anthropometry and Physical Anthropology*. Apart from descriptive anthropometry, various biological questions engaged attention as to their bearing on man. Much of the avowedly eugenicist literature that flooded the market may be unqualifiedly stigmatized as unscientific trash, but the relevant data as seen by a eugenicist were set forth in a spirit of exemplary caution in S. J. Holmes's *The Trend of the Race* (1921). Closely correlated with these problems is that of Mendelism and of heredity generally. By far the most thorough inquiry into miscegenation was Fischer's investigation of Dutch-Hottentot breeds (1913), which seemed to prove Mendelian inheritance for some features. At all events, certain traits such as tallness appeared dominant, and the mutually independent transmission of distinct traits was demonstrated by the coexistence of spiral hair with blondness in breed children. In northernmost Norway, where Lapps and Scandinavians have intermarried, H. Bryn (*Troms Fylkes Antropologi*, 1922) likewise finds evidence for Mendelism, but it must be admitted that exact proof for the typical ratios has not yet been furnished for the human species. This point is made in F. Boas's *Report on an Anthropometric Investigation of the Population of the United States* (*Journal of the American Statistical Association*, 1922), where the basic interrelations of environment and heredity are discussed. A large number of important articles on biological anthropology appeared in the *American Journal of Physical Anthropology*, founded and edited by Dr. A. Hrdlicka.

A whole series of semipopular treatises became available for the layman's orientation. The account in A. L. Kroeber's *Anthropology* (1923) may be recommended for its conciseness and the infusion of a sense for culture-history as a whole, frequently lacking in more detailed discussions. A clarification of the highly misleading connotation of the term Neolithic is among the merits of this exposition. Since the grinding of stone did not begin in Europe until a relatively late stage of this period a new definition in terms of the first appearance of the bow, pottery, and the dog is imperative. In this view Kroeber more or less coincided with G. Elliot Smith, who, however, not only divided off the Neolithic along similar lines but also regarded as more fundamental the division of the Upper from the Lower Palaeolithic (*Primi-*

tive Man, 1916). M. C. Burkitt's *Prehistory* and R. H. S. Macalister's *Text-book of European Archaeology* are storehouses of fact. The former emphasized prehistoric art. H. F. Osborn's *Men of the Old Stone Age* and Sollas's *Ancient Hunters* are also convenient summaries. For the Neolithic, J. M. Tyler's *The New Stone Age in Northern Europe* is an accessible guide. A great deal of valuable research in France and Spain has been done or stimulated by Abbé H. Breuil, whose reports appear from year to year in the issues of *L'Anthropologie*.

Outside of Europe relatively little work of fundamental value for the early history of mankind was done, though in America much was accomplished with important bearings on later epochs tying up with historic populations. Siberian data were well summarized in Gero von Merhart's essay in the *American Anthropologist* (1923, pp. 21-55), which described the Yenisei finds as corresponding to the European Upper Palaeolithic; the Solutrean technique is absent, but Aurignacian types are paralleled, nor are Magdalenian features wanting. Sensational conceptions of extra-European Palaeoliths were developed by J. Bayer (*Mannus*, vol. xi-xii, pp. 215-223), who synchronized them with the proto-Neolithic of Europe. This he coupled with a rejection of the traditional glacial chronology by combining the Riss and Würm periods into one, with the Lower Palaeolithic at its commencement and the proto-Neolithic at its close. See ETHNOGRAPHY; ETHNOLOGY; EUGENICS; MAN, PREHISTORIC RACES OF; RACE PROBLEMS IN THE UNITED STATES.

ANTIN, MARY (1881-). An American writer on the immigrant. She was born at Polotzk, Russia, came to America in 1894, and was educated in the public schools, the Girls' Latin School (Boston), Teachers College (Columbia University), and Barnard College. Her books, especially *The Promised Land* (Boston, 1912) and *They Who Knock at Our Gates* (Boston, 1914), made an instant and deep impression by their sincerity, their idealism, and the vividness with which she shows, from her own experience, what America means to the immigrant. Her other works are *From Polotzk to Boston* (Boston, 1899); *At School in the Promised Land* (selections from *The Promised Land*, Boston, 1916), and *The Lie* (Boston, 1919).

ANTIOCH COLLEGE. A nonsectarian, co-educational institution at Yellow Springs, Ohio, founded by Horace Mann in 1853. The student enrollment increased from 230 in 1913 to 500 in 1923-24, the faculty from 20 to 48 members, and the library from 12,000 to 16,000 volumes. In the fall of 1921, the college was completely reorganized. The Antioch plan undertook to determine what were the controlling demands and opportunities of modern life and to furnish in a single orderly programme those elements of discipline and training which would best prepare students for all the relationships of life, personal, social, and vocational. In pursuance of this plan, the college united, in a single co-ordinated course of six years, a liberal college education, guidance in the choice of a profession or other calling and training for it, and a

practical apprenticeship to life through part-time, practical work. Students were not accepted who desired to confine themselves solely to technical training. The purpose of the part-time, practical work was primarily to develop self-reliance and responsibility and to give the student first-hand acquaintance with practical life and his own powers. The part-time work also helped the student to discover and prepare for his calling and more than cut in two the cost of a college education. Half the students studied while the other half worked, in alternate periods of five weeks. More than a hundred firms cooperated with the college in this programme. The enrollment was limited, and very close relations were maintained between students and faculty. The professional and other vocational courses prepared for engineering, business administration, education, journalism, and institutional management. Emphasis was placed on administrative and managerial training rather than on specialized technique. Arthur E. Morgan succeeded A. D. Fess, LL.D., as president in 1921.

APOLLINAIRE, GUILLAUME (1880-1918). A French poet and novelist. He distinctly represented the extreme modernist tendencies of *les jeunes*. He did not live to see the crystallization of the Dadaist movement, but the inspiration for its new formula of aesthetics, with its suggestion of a juggler doing tricks before spectators, came largely from his writing. As editor of *Le Festin d'Esopo* (1903-04) and *Les Soirées de Paris* (1913-18), he influenced both the younger school of French poetry and cubist painting. He hoped to develop an aesthetics which would unite poetry and painting into a single art. His works include *L'Enchanteur Pourissant* (1903) and *Hérésiarque et Compagnie* (1912), his prose masterpiece. *Alcools* (1913) is a collection of his more finished poems. *Le Poète Assassiné* (1918) is a lyric autobiography relating his impressions of the War. *Calligrammes* (1918) contains verses composed at the front. *La Femme Assise*, published posthumously in 1921, is a novel in the new manner.

APPLETON, WILLIAM ARCHIBALD (1859-). A British Trade Union leader, born at Nottingham, England. He was a lace-maker in Nottingham until 1896, when he became secretary of the Lace-Makers' Trade Union. In 1907 he was elected secretary of the General Federation of Trade Unions of Great Britain, an organization to provide strike benefits for members of unions affiliating with the General Federation. He was accepted as

spokesman for British labor by the British government during the War, although it was maintained that his organization was usurping the powers of the British Trade Union Congress and the Labor party.

APPONYI, ALBERT, COUNT (1846-). Hungarian statesman (see VOL. I). He served in the Hungarian Chamber of Deputies during the War but retired in 1918 as a result of the October revolution. In the next year he sat in the National Assembly and also represented his country at the Peace Conference. Later he took his place in the Lower House of the newly constituted Hungarian Parliament, and as a tribute to his avowed nonpartisanship, though his sympathies were with the exiled royal family, he was chosen speaker. His influence on Hungarian policy was great, and he was recognized abroad as one of Hungary's authentic spokesmen. In 1923 he visited the United States at the invitation of the Institute of International Education and was cordially received.

AQUEDUCTS. With the notable growth of cities and town development generally in the United States the extension and increase of existing water supplies, and the provision of new sources of water supply became an important consideration. Not only was there a large and sudden gain in population in many American cities, but at the same time improved standards of living and in some instances industrial needs rendered necessary more abundant water supplies. In some cases, such as New York and Los Angeles, California, provision already had been made and the increased facilities were availed of with the ever-growing demands. In certain of the cities on the Great Lakes it was found necessary to increase the tunnels by which the supply was received, and also the purification plants, while in other cities, such as San Francisco, notable projects were designed to take care of future needs.

In Europe also the needs of an increased water supply were appreciated in many districts. The conditions following the War were hardly such as to make important developments possible. In Italy a comprehensive scheme in Apulia was brought to a successful completion in 1923, and other work was under way.

Aside from the size and length of the more important projects there was but little novelty in their construction. In many cases they involved rock tunneling, sometimes on an unprecedented scale, as in the case of the Shandaken Tunnel of the Schoharie development of the Catskill Aqueduct, while elsewhere long pipe lines of steel covered with concrete or other types of construction were involved.

Shandaken Tunnel. The Schoharie development, referred to above, involved the construction of an 18-mile tunnel in rock to connect a reservoir formed by the construction of the Gilboa Dam (for description and plate see DAMS) across the Schoharie Creek, with Esopus Creek, whence the water would flow along the original stream bed into the Ashokan Reservoir and augment the available supply for the City of New York by some 500,000,000 gallons daily. The Shandaken tunnel, which was opened early in 1924, was designed for a maximum capacity of 800,000,000 gallons per day to be operated intermittently and at varying rates depending upon the conditions of the stream flow and storage requirements.

The tunnel had a horseshoe cross-section with

a maximum internal height of 11 feet, 6 inches, and an internal breadth of 10 feet, 3 inches. It was driven from each portal and by sinking six intermediate shafts, concrete lined, 14 feet in diameter, and driving headings from them in both directions. The total length was 95,740 feet, or 18.1 miles, and the tunnel was lined throughout with concrete. It was the longest continuous tunnel in the world, being 1787 feet longer than the New York City aqueduct tunnel for the delivery of Catskill water within the city limits.

Greater New York Aqueducts. Notwithstanding the large capacity of the Catskill water supply system as planned it became evident in 1922 and 1923 that additional conduits must be provided to afford an adequate supply to the boroughs of Brooklyn, Queens and Richmond, where there had been a phenomenal growth in the residential districts. Portions of the boroughs of Brooklyn and Queens had drawn their supply from Kings, Queens and Nassau counties, while Richmond (Staten Island) had been supplied not only from local sources but from the main Catskill Aqueduct by a 36-inch cast-iron siphon under the Narrows. The new construction involved a cast-iron 42-inch pipe line across the Narrows from Brooklyn to Staten Island, and a series of steel pipe conduits, most of which were 72 inches in diameter, taking the water from the main city tunnels in Brooklyn. Thus one of the lines extended from Shaft 23 at Flatbush and Third Avenues, Brooklyn, to Silver Lake Reservoir in Richmond, and comprised the Park Slope and Fort Hamilton conduits in Brooklyn, 41,430 feet in length; the new Narrows Siphon No. 2, already mentioned, 9400 feet long, across the Narrows, and the Clove conduit, 16,600 feet long, in Richmond Borough.

These conduits which vary from 72 inches in diameter for the Park Slope and Fort Hamilton conduits to 66 inches in diameter for the Clove conduit on Staten Island, were designed primarily to supply Richmond Borough, but also afford direct connection with the mains of the Brooklyn high pressure service and with the intermediate and low service in South Brooklyn and Bay Ridge. Another conduit was an independent line in Brooklyn, 16,800 feet in length, known as the Mt. Prospect conduit, extending from Shaft 24 of the city tunnel in Fort Greene Park to the Flatbush district, in order to relieve the draft on the shaft from which the supply previously was drawn. It was proposed also to construct a line from Shaft 24 to Long Island City.

These various pipe lines were noteworthy in that steel pipe was used in place of cast iron as it was considered more economical and more reliable in conduits of large size. These pipes are made up in sections not less than 30 feet in length, fabricated in taper courses $7\frac{1}{2}$ feet long with double-riveted lap joints for the longitudinal seams and single-riveted lap joints for the transverse seams.

Hetch Hetchy Aqueduct. After many years of discussion and plans the city of San Francisco started a much-needed water supply development in 1919 by awarding the contract for the Hetch Hetchy dam situated on the Tuolumne River about 150 miles east of the city. From the reservoir thus formed water was to be carried to San Francisco and the metropolitan district by means of a system of aqueducts

with an ultimate capacity of 400,000,000 gallons a day. At the same time due to the height of the reservoirs in the mountains there could be developed 200,000 hydro-electric horse power. The aqueduct was being constructed in sections as needed, the first or Mountain section beginning at Early Intake and extending after a short open canal in a tunnel through the mountains 18.3 miles to Moccasin Creek, where a power plant was located. The Foothill division has about 17 miles of aqueduct from Moccasin Creek to Oakdale Portal and then there are 45 miles of steel pipe across the San Joaquin Valley to Tesla Portal. The Coast Range tunnel would extend 31 miles to the east side of San Francisco Bay at Irvington Gate House where the line would divide in three, the main portion extending westerly under the bay through a pipe line of 200,000,000 gallons capacity to the San Francisco peninsula, another section going to the east bay cities, and the third southwest to San José. The new aqueduct by means of a connection of 23 miles between the Alameda Creek and the Crystal Springs reservoir of the Spring Valley Water Company was to be connected with that system. The Hetch Hetchy supply thus could be made available through the Spring Valley system as required so that the distribution facilities could be used so long as they are adequate.

Hetch Hetchy Dam. The total estimated cost of the entire Hetch Hetchy project from the mountain reservoir to Crystal Springs Reservoir, San Francisco, in 1924 was placed at \$78,000,000, and of this amount some \$45,000,000 had been spent up to Jan. 1, 1925. This sum covered the 18-mile tunnel, the dams and other work in the mountain district, most of the work on Moccasin Creek hydro-electric plant and the 60-inch pipe line from the Crystal Springs reservoir to Irvington. It was estimated that the section of the aqueduct not put under construction by 1924, from Moccasin Creek to Irvington, would cost \$33,000,000, this portion, it would be noted, including 17 miles of tunnels on the eastern side of the San Joaquin tunnel to 30 miles of tunnels to the west of that valley. This part of the project was to be known as the San Joaquin Valley Division.

Winnipeg Aqueduct. A different type of aqueduct was this important water supply system put under construction in 1913 and completed so that in 1919 the first water could be passed through. The country traversed is generally flat and the aqueduct is 80 miles in length from the intake at the lake reservoir to within 17 miles of Winnipeg. It is built of concrete pipe and arch sections and has a nominal capacity of 85,000,000 gallons a day, though this is exceeded.

Apulian Aqueduct. One of the longest aqueducts in the world, including some 152 miles of main trunk and 841 miles of main and subsidiary branches or a total length of supply conduits of 993 miles, was put into service in 1924 in southern Italy. This project, which as regards total length could be compared with the Coolgardie pipe line in Australia, is 350 miles long and may be compared with the Los Angeles aqueduct, the longest in America, about 240 miles in length. It was constructed to supply some 286 communities with a population of about 300,000 people, scattered over some 8100 square miles, and included in the ancient

Apulia on the eastern or Adriatic slope of the Apennine Peninsula.

This work had been under construction since about 1907, and involved a main trunk conduit beginning at the Caposele Springs at the head of the Sele River on the western slope of the Apennines, and extending in an easterly direction piercing the Apennine Mountains by means of a series of 38 grade tunnels, aggregating almost 50 miles in length. At a point 15 miles away from the Adriatic Coast, the main aqueduct turns southeast and runs practically parallel with the coast for about 90 miles until it reaches Villa Castelli in the province of Lecce. For this portion of the aqueduct the construction was largely a cut-and-covered conduit. The total length of the main trunk aqueduct is 244 kilometers (152 miles), and in this are included 99 tunnels of about 67 miles total length, about 76 miles of cut-and-covered conduit, 93 aqueduct approaches, having a total of 4.25 miles in length, and six siphons having a total length of 4.6 miles. From the main trunk branches were built to such towns and districts as Foggia, Bari, Brindisi, Toranto, etc.

Tulsa, Oklahoma, Aqueduct. In 1924 one of the longest reinforced concrete pipe lines that had been attempted was constructed to bring mountain water from Spavinaw Creek 55 miles distant from the city. Here there was a reservoir formed by a gravity concrete dam of 55 feet maximum height. From this reservoir a pipe line made of 54- to 60-inch reinforced concrete formed a conduit to carry the water to a pumping station at the end of the pipe line. In connection with this conduit, the pipes for which were made in the field, there was also constructed the Tiawah Tunnel, a 7000-foot solid rock tunnel of horseshoe section 84 inches in diameter which was lined with concrete. This tunnel was constructed from four headings—one at each end and two from the intermediate shaft. See DAMS; TUNNELS; WATER SUPPLY.

ARABIA. A peninsula of southwestern Asia. The area is estimated at 1,000,000 square miles, the population from 4,000,000 to 5,000,000. Because of the nomadic habits of the Bedouin tribes inhabiting the peninsula accurate population figures are impossible. The settled communities are to be found in the oases of Central Arabia and in the fertile districts along the coasts. The boundaries of the various principalities are ill-defined and the loyalties of the various tribesmen are equally tenuous. The political divisions in existence in 1924 were:

(1) *The Kingdom of the Hedjaz*, which has an estimated area of 170,000 square miles and an estimated population of 900,000. It is the chief principality of Arabia because of its possession of the holy cities of Mecca (population 80,000) and Medina (population 10,000). The capital is Mecca and the chief port Jidda (population 20,000). The gathering of dates forms the leading activity of the natives; the more important imports are foodstuffs and building materials. Through the heart of the kingdom runs the Hedjaz railway with its terminus at Medina (815 miles), and it was the possession of this route which rendered Turkish power supreme in Western Arabia. On June 6, 1916, the Sherif Hussein threw off the suzerainty of the Turkish Sultan and assumed the title of King of the Hedjaz. (2) *The Emirate of Nejd and Husa*, in Central Arabia, which has an estimated population of 400,000. Its capital is

Rujadh (population 20,000). Other towns are Boreida (15,000) and Anciza (10,000). Hides, butter, dates, textiles, and live stock were produced and exported to some extent. In 1914 the Emir Ibn Saud expelled the Turks from Hosa and pushed his dominions to the borders of the Persian Gulf. (3) *The Emirate of Sch-el Shammar* in Central Arabia north of Nejd. The estimated population is placed at 250,000. The capital is Hail. The ruler in 1924 was Abdullah Ibn Mitab, who ascended the throne on the assassination of his cousin Ibn Raslud (1920). During the period 1914-24, the principality fell, to some extent, under the power of Nejd. (4) *Asir*, a small area on the Red Sea coast, South of the Hedjaz, with an estimated population of 1,000,000. The ruler was Mohammed Ibn Ali-el-Idrisi, but Highland Asir was controlled by the Aidh family. (5) *The Imamate of Yemen*, at the southwestern extremity of the peninsula. Its estimated area is 75,000 square miles; estimated population, 1,000,000. The capital, Sanaa, had 25,000 inhabitants; the chief port, Hodeida on the Red Sea, 40,000. Mocha was another port. The leading economic resource was coffee, which was exported through Aden. On the East the leading principalities were virtually British protectorates, for Great Britain supported the reigning houses and controlled their external policies. These principalities were: (6) *The Sultanate of Oman*, in southeastern Arabia, with a coast line of 1000 miles on the Oman and Persian Gulfs. Its area is 82,000 square miles; population, 500,000. The largest cities are Muscat and Matrah, which together have 20,000 inhabitants. Dates are produced, and exported, while the imports include rice, cotton goods and coffee. All these enterprises are controlled by British Indians, and it is with India that intercourse is mainly carried on. The Sultan's independence was guaranteed by Great Britain and France, a step made necessary by the turbulence of the interior tribes which recognized the sovereignty of the local Ibadhi imamate rather than that of the sultanate. (7) *Trucial Oman*, on the eastern coast, made up of five sheikdoms. (8) *El Qatar*, a sheikdom on the peninsula of that name, from which the Turks were driven out in 1913 by the Emir of Nejd. (9) *Bahrein*, made up of a group of islands of which Bahrein Island is the chief. The ruling sheik was maintained by a British subsidy. (10) *The Sultanate of Koweit*, in the southeast on the Persian Gulf. It has an estimated population of 50,000. The town of Koweit is of considerable importance and most of its trade is carried on with India. In 1914 the sultan renounced the sovereignty of Turkey and threw in his lot with the Allies. The present ruler is subsidized by the British government. The remaining political divisions are: (11) *The Protectorate of Aden* (see ADEN); (12) *The Kingdom of Transjordan* (see TRANSJORDANIA), Irak (q.v.), Syria (q.v.), and Palestine (q.v.) are also Arab lands, though situated north of the Arabian peninsula.

Explorations. The War greatly retarded the exploration and subsequent mapping of the country, so that it is doubtful whether much more was known of this land in 1924 than in 1914. While some new knowledge was acquired of the topography and social and economic life of Asir and Yemen, the only real advances were made in Central Arabia and in the

Hedjaz Kingdom. The outstanding achievement was the work of H. St. J. B. Philby, who, in 1917, on his way to the court of the powerful Emir of Nejd, penetrated into the heart of Central Arabia and thus was the first European in 100 years to cross from sea to sea. His journey lay from Ojair on the Persian Gulf to Jidda on the Red Sea, by way of Hofuf, Riyadh, and Taif. In the following year he journeyed into the southern provinces of Nejd, laying his course from Riyadh to Dam, the capital of the little known Wadi Dawasir. As a result of these activities cartographers were able to settle more accurately the locations of such places as Riyadh, Hair, Sulaiyil, and Dam. His discoveries of a large lake near Laila and of several reservoirs were of particular importance. Two other travelers achieved notable success. In 1914 Miss G. L. Bell and Capt. W. H. I. Shakespear each added 1500 miles of survey by their observations. The latter, in a three and one-half months' journey just before the outbreak of the War, crossed Arabia by a northern route, traversing 1200 of the total 1810 miles, through country hitherto unknown to Europeans. His line lay from Koweit, on the Persian Gulf, to Kuntilla, the first Egyptian outpost in Sinai. Shakespear was killed in January, 1915, in a clash between forces of Ibn Saud and Ibn Rashid. During war operations, British military and naval officers carried on extensive researches in the Hedjaz.

Communications and Trade. The only railway in Arabia was still the Hedjaz line, though the construction of two branch lines was considered during the period 1914-24. The first was to run from Medina to Mecca (280 miles) and the second from Maan to Akaba on the Red Sea. Internal communications continued to be carried on by means of the native caravan routes, the most important of which was the transpeninsular track from Zobeir to Jidda by way of Boreida and Mecca (913 miles). Economically the activities of the Arabs were devoted largely to the satisfaction of their local needs. Cereals were cultivated, and camel, horse and ass rearing was carried on to some extent. Articles of export included dates, hides, coffee, pearls, and the native butter; imports were made up of cotton goods and foodstuffs. On the western coast the important ports of call were Aden, Hodeida, Jidda, Mocha, and Jeizan; on the eastern coast, Muscat, Manama, and Koweit. The only ports carrying on a considerable commerce with Europe and the East were Aden and Manama, which were becoming the entrepôts for Arabia. For Aden, for example, imports totaled £4,377,000 in 1913-14, and £6,000,000 in 1921-22; exports for the two years, £4,140,000 and £5,000,000.

History. The story of Arabia, over the period 1914-24, may be divided into two phases, the first that of the ascendancy of the British in Arabian affairs, exerted largely through the control of the King of the Hedjaz; the second that of the passing of this influence with the growing suspicion of British purposes and the increasing importance of the native Wahabi movement, led by the Emir Ibn Saud. Arabs had looked coolly on the Pan-Turanian movement before the War; what nativist sentiment there was was largely centred in the idea of an Arab empire free from Turkish control. At one pole was thus the ambition of the Ottoman Sultan to absorb Arabia completely; at the

other stood the aspirations of the various local leaders to head a nationalistic movement. It was the ability on the part of the British to capitalize this discontent that saved Arabia from a holy war and freed British possessions in Arabia and East Africa, as well as India, from the threat of serious Ottoman attack. In Hussein, the Sherif of Mecca, the British found the key to the situation, for in 1915 they succeeded in making a treaty with him which guaranteed the establishment of an independent Arab state under the Sherifian family for the support of the war against the Turks. Thus buttressed by British arms, Hussein, who up to 1913 had fought in the Turkish cause, threw off his allegiance to the Sultan and in June, 1916, declared his independence. In December he assumed the title of King of the Hedjaz; in the next year he was recognized by the Allies. The Anglo-French declaration of Nov. 8, 1918, renewed the promise of Arab independence; the Hedjaz was represented at the Peace Conference by Hussein's ambitious son, the Emir Faisal; and in 1920 the country gained admittance into the League of Nations. But after 1920 it was perceptible that neither was Hussein a dominating power in the Arab world nor was it at all likely that Hedjaz would ever grow to be a united Arab kingdom. In the first place Pan-Arab ideals envisaged the incorporation of the Sudan, Syria, Palestine, and Mesopotamia with Arabia, an amalgamation which Great Britain and France were prepared actively to oppose. By the Sykes-Picot agreement of 1916 and the Balfour Declaration of November, 1917, the French and British had indicated their interest in Mesopotamia, Syria, and Palestine, which they took as mandates when the War was over, regardless of Pan-Arab protests. To some extent, however, the British government was willing to utilize Hussein's aspirations; indeed on June 14, 1921, the British Colonial Secretary announced that Great Britain would thenceforth pursue the policy of Sherifianism; that is, of placing members of Hussein's Sherifian dynasty on the thrones of other Arab kingdoms. Accordingly two of Hussein's sons were given thrones. Emir Faisal was established in Irak (see MESOPOTAMIA) and Emir Abdullah in Korak or Transjordan (q.v.). The British administration in India vehemently opposed any further extension of the Sherifian power; in fact the Indian government had proposed to create an Arab state based on Bagdad and ruled by Ibn Saud of Nejd, Hussein's rival. The reason for this attitude was that in view of the Moslem desire to have the Holy Places controlled by an independent Moslem power, the maintenance of an admittedly British-controlled kingdom of Hedjaz seemed an act of folly. The abandonment, however, of the Ottoman caliphate (q.v.) by the Turkish nationalists in 1924 played into the hands of the advocates of Sherifianism, and King Hussein in that year not only revived his political ambitions but also indicated his aspirations to the caliphate. On the other hand the Arabs of Central Arabia looked askance at a dynasty so obviously used as a pawn by British imperialism; increasingly they pinned their hopes on Nejd as the nucleus of Arab nationalism. This attitude was strengthened when King Hussein, during the course of treaty negotiations with Great Britain in 1923-4, indicated his intention to recognize the British interest

at least in Mesopotamia and Transjordan, if not in Palestine as well.

During the period 1914-24, Ibn Saud, Emir of Nejd and spiritual leader of the Wahabi or Akhwan movement, steadily extended the outposts of his domain, so that 1924 saw him the most influential individual in Arab affairs. In 1914 he wisely allied himself with Great Britain and thus was able to wage war without hindrance against his neighbor to the North, Ibn Rashid, Emir of Jebel Shammar, who had espoused the cause of the Turks. His campaigns were generally successful, with the result that in 1918 Ibn Saud controlled Central Arabia. It was plain that Ibn Saud had ambitions to the West; his relations with Hussein, never heretofore cordial, became strained in 1919-23, and here and there fighting took place over boundary questions; but the presence of Great Britain served as a check. Meanwhile Ibn Saud continued to consolidate his position and advance his power to the East. Koweit was his immediate objective. The Akhwan movement showed no signs of abating, and Hussein's pretensions to the caliphate were regarded with indifference in 1924. But Hussein's political manoeuvres were the cause for a deeper concern. In 1924 he showed a renewed energy in the furtherance of his own fortunes. A trip was made to Amman, the capital of his son Abdullah, Emir of Transjordan, where conversations were carried on with the British and French High Commissioners; there was much talk on the part of Arabs in the Hedjaz, Transjordan, Palestine, and Mesopotamia, of an Arab confederation; Hussein began to style himself King of Arabia. To all this, Ibn Saud's reply was bluntly that Hussein was not acceptable as leader to Central Arabia. On this discordant note the events of the summer of 1924 closed.

ARBITRATION, IN INDUSTRIAL DISPUTES.
See LABOR ARBITRATION.

ARCHÆOLOGY. A considerable portion of the period 1914-24 was occupied by the War, during which archaeological investigation was curtailed. Yet enough was done to throw new light on old problems and following the close of the War a considerable intensification of archaeological exploration was observable. Egypt perhaps less than any other country felt the impact of the War, so that here there was a more consistent development of work than elsewhere. At Abydos in 1914, behind the West wall of Seti's temple was found what is probably the mystic tomb of Osiris. This is an underground structure, thirty feet below the level of the temple. It may be described as a rectangular hall about 60 x 100 feet with walls 20 feet thick. There are three aisles separated by huge monolith piers 8 and a half feet square and 15 feet in height, 5 on each side of the central aisle. These piers support an enormous architrave, 6 feet in height, which in turn carries a ceiling of granite blocks 6 feet in thickness. In 1917 the expedition sent out by the University of Pennsylvania investigated at Gizeh the ancient necropolis near the pyramid of Cheops. It was found that the tombs belonged to princes and lesser officials. The burials took the form of shaft graves. From one tomb was recovered an inscription containing the cartouches of Cheops, Chephren, and Dedefra, which established the fact that these kings followed each other in the order given.

The most consistent work, at least in continuity of exploration, was that of the Metropolitan Museum of Art, which from 1910 investigated its chosen site at Thebes. In 1918 it carried to completion the excavation of the palace city of Amenhotep III. On this site in 1922 was discovered one of the most important demotic papyri yet found. It throws light on the history of Egypt during the period 309-246 B.C. During his work at Illahun in 1920, in which he cleared the 12th dynasty pyramid and its surroundings, Petrie came most unexpectedly on a small undisturbed prehistoric cemetery which contained about one hundred burials. Practically every stage was represented from the open grave to the shaft tomb. In all, 30 different types were counted. One of the most interesting finds of the year 1920 was the discovery of the 11th dynasty tomb of Mchenkewre. It lay to the South of Deir el-Bahari. In the monument was a small chamber which contained a complete set of funerary models of gardens with pools, fruit trees, covered walks, slaughter houses, carpenter shops, breweries, bakeries; in fact the complete equipment of a princely house.

In 1921 the Egypt Exploration Fund resumed its work at Tel el-Amarna. This had been interrupted by the War. Had the town no other claim to distinction than its association with the name of Akhenaten it would still be interesting. But excavations showed that it presents a beautiful illustration of organized town-planning. One of the most interesting discoveries was that in some instances the streets reached a width of 180 feet. The digging afforded much information as to the character of the private houses of the Egyptians. Of course in this case the houses were for the use of workmen, and, doubtless for economy, they were arranged according to one plan; yet it may be assumed from that very fact that the plan was usual. It showed in the centre of the house a square living room with its clerestory. In this room was a large clay brazier for heating and an ablution slab for the ceremonial washing of hands and feet. The work of the succeeding year, 1922, was concentrated on the workmen's village, the main city, the river temple and the precinct of the South pool. From this campaign was derived an excellent idea of a princely villa. About the time of this discovery, Petrie was doing interesting work a mile or so distant from the Royal Tombs at Abydos. Here it was found that each king had laid out a great square of graves about 240x400 feet. In this area were discovered some 500 graves in which was evidence of the practice of human sacrifice. Apparently at the death of a potentate court officials were buried alive with their master. One might imagine that such a custom must have had a depressing effect on the desire to hold office. The dates of the interments are from the third to the fifth dynasty, that is to say, 5437-5363 B.C. Among the objects found was an ivory comb of King Zet. Many bone arrow heads and neatly trimmed flints were recovered.

The most spectacular discovery since Theodore N. Davis's finding of the tomb of Youa and Touya was the opening of the rockcut tomb of Tutankhamen (q.v.) by Lord Carnarvon and Howard Carter in the Valley of the Tombs of the Kings at Luxor in 1922. Here below the tomb of Rameses VI was uncovered the opening

of the tomb of this king. A flight of stairs led down to two rock-hewn chambers which were literally crammed with golden treasure. The intrinsic value of the find, estimated at \$40,000,000, is astounding enough in itself. The tomb was a revelation of the luxurious life of an Egyptian king in the second millennium B.C. (c. 1350). Owing to differences between the Egyptian government and Mr. Carter, who carried on the work after the sudden death of Lord Carnarvon, the exploration of the tomb is incomplete. Just at the moment when the British archaeologist was about to open the sarcophagus of the king work was suspended. Especial interest attaches to the find historically, because this prince was the son-in-law of the famous heretic king, Akhenaten.

Perhaps the most important result of the 10 years' work was the gradual collection of data on the early history of predynastic Egypt. As far back as 1911 the Archaeological Survey of Nubia showed a certain correlation of the culture of this land with that of early Egypt. So far as can be made out, the indigenous population of the Nile Valley was closely related to this Nubian stock. In the course of time this primitive civilization was overrun by the invasion of a race which seems to have come in from Asia and to have begun this dynastic history of Egypt. As if in retribution, this Nubian stock appears to have returned, at a much later date, to its ancient dominion of the Nile valley. This is borne out by the results of the expedition sent to Nubia in 1921 by Harvard University and the Boston Museum of Fine Arts. At Napata the explorers examined royal cemeteries and at Nuri a group of pyramids belonging to kings and queens who lived in the years 660-250 B.C. Not the least interesting event was the uncovering of the burial chamber of Tihaga, who is mentioned in Isaiah. From the data collected by the expedition it is fairly well established that this Ethiopian people, of Libyan origin, entered the land about 900 B.C. and eventually became the conquerors of Egypt.

Asia Minor, because of the operations of the War, was a less profitable archaeological field than Egypt. The Mesopotamian valley became a seat of war, and the great excavations inaugurated by the Germans at Babylon in the last years of the nineteenth century by Koldewey came to a close with the opening of hostilities. The resumption of archaeological work throughout this territory was tardy. In a measure the delay was occasioned by the manifest hostility of the Turks toward western people. In 1920 the British Museum resumed its work at Carchemish, which had been interrupted in 1914. The efforts of the excavators were concentrated upon the site of the double ring of the city walls. On the land side all the gates, the fortifications of the acropolis, and the great river wall were cleared out. On this site of Carchemish were discovered a number of Hittite tombs and certain other archaeological material belonging to this race. All evidence illuminating this mysterious people is welcome, but in spite of attempts to show an Indo-European source for the race, results at the end of this period had not been conclusive. One particular bit of evidence for the story of prehistoric Greece at least is the discovery of an inscription which records a treaty between a certain Hittite king and Atreus of Mycenæ. Not only is this document important for establishing

contact between the Greek mainland and the coast of Asia Minor, but it also strengthens the value of Homer as an historical document. Work at Nippur produced new tablets narrating the stories of the creation and the deluge. Moving westward into Palestine, the diggings of the English at Bethshehem threw some light on the origin of the Philistines, who appear to have been a people penetrating from the Mediterranean area. The establishment of the American School at Jerusalem was expected to produce results which would help to clear up the early history of this part of Palestine.

Greece was the scene of renewed archaeological activity at the close of the War, as well as the islands of the Ægean, and the eastern shores of the Mediterranean. In 1922 the American School of Classical Studies, in association with the Fogg Art Museum of Harvard University, began explorations at Rhodes. At Colophon the French had been engaged in excavating. At the latter place evidences of geometric culture, probably of the sixth century, were discovered, and at one place a Mycenaean beehive tomb was found, which shows that about 1000 B.C. the culture of Ionia was about the same as that of the Ægean and the Greek mainland. As in Egypt, considerable of the archaeological work in Greece was connected with the problem of the prehistory of the country. For a long time it had been the concern of scholars to discover the source from which came the pre-Mycenaean stock. As early as 1912 Wace and Thompson worked in Thessaly and were able to establish that at least in that part of Greece the inhabitants had penetrated into the peninsula from the North. In this early period, contact with the southern, Mycenaean culture of the Mediterranean was not established until well on toward the close of the Bronze Age. This pre-Mycenaean civilization was latterly given the somewhat vague name of Helladic. That the people represented by this culture penetrated gradually southward until they overran Greece is proved by Blegen's discoveries at Korakou, not far from Corinth. From the evidence already accumulated it would appear that this Helladic culture represented what might be called the original civilization of the Greek mainland and that its creators continued in control of the country until, fairly early in the second millennium before our era, the race represented so well in the remains in Crete and later at Tiryns and Mycenæ invaded from the Mediterranean, and conquering the native stock, made themselves overlords and gave us what we call Mycenaean culture. The use of the term Helladic indicates an effort to discover a name which will describe more accurately than Mycenaean or Minoan that culture which in the days of the florescence of Mycenæ, to use the words of one of its inventors, Dr. Blegen, extended "from Thessaly to Southern Laconia and from Thoricus to Pylos." The name, as can be seen, is intended more closely to fit the breadth of culture which obtained in early Greece than any local or dynastic name could. This culture, or rather the period covered by this name, follows upon the Neolithic Age in Greece. It is synonymous with the Age of Bronze. Its dates are about 2500 B.C. to 1200 B.C. Since it is a period in which dates are all too vague, it has been found convenient to divide it, as in Crete, into three divisions, known respectively as Early

Helladic (2500-2000), Middle Helladic (2000-1600), and Late Helladic (1600-1150?). Late Helladic is meant to be synonymous with Mycenaean. This was the time when the power of Minoan Crete had extended northward and overcome the indigenous culture which, developing on the mainland, had stemmed from the north before the coming of the Ægean folk.

Wace, who had already worked in Thessaly, showed by work at Mycenæ that this place was already inhabited at the close of the Neolithic Age and became a flourishing city about 2000-1500 B.C. He discovered that the famous circle of graves within the Lion Gate belonged to this time. His examination of the palace made it clear that the structure was much more elaborate than had previously been believed. It appeared that, after Cnossus fell, the city was fortified by a wall which was also carried around the famous circle of graves. At that time the ground was leveled, the circle of slabs erected and new gravestones put in place to mark the site of the original burials. These tombs belong to an earlier dynasty than that represented by the beehive tombs. To return to the palace, Wace found that the structure, which dates 1400-1100 B.C., is of the megaron type. Under it were traces of first or second Late Helladic culture (1600-1400). To this latter time belong the circle of graves which continued in use until 1400 B.C. Under the present palace remains were remains of an earlier palace dating about 2200-1800 B.C. This structure, older than the palace at Tiryns, was later replaced by one belonging to the first Late Helladic period, and that in turn by one much larger. This one recalls the building at Cnossus and helps to show the relationship of this culture with that of Crete. The accumulated evidence makes it clear that the earliest settlement on the site goes back to the beginnings of the Bronze Age. The place became important in the period reaching from 1800 to 1600 B.C. By the year 1300 Mycenæ had become the chief city of that part of Greece and so continued until the coming of the Dorians.

At Carthage notable work was done by the French, who excavated two Punic temples and a Punic acropolis dating about 700 B.C. Near the Punic parts of the city was discovered the temple of Tanit in the midst of a field which was practically covered with votive inscriptions set up in her honor and to Baal Ammon. Under these inscriptions was uncovered a bed of urns containing the bones of birds and sheep as well as those of a few children. In the deepest stratum, third from the top, many jars were found containing the bones of children whose ages ranged from four months to twelve years, grim evidence of the human sacrifice practiced in the name of the goddess Tanit. The date of these remains is about 800 B.C. So far as can be made out, Carthage was a flourishing Egyptian colony at the time Dido was supposed to be building it. Egypt had established a settlement there some 500 years before the coming of the Phœnicians.

In Italy little that is remarkable occurred. War gripped the country too hard. One notable discovery was made in 1921, when an important hypogeum was located outside Porto Maggiore. The building dates from the end of the second or early in the third century of the Christian era. In the upper part is a sepulchral chamber down to which leads a

staircase that ends on a landing just outside the room. The main chamber is 15x17 feet and has a vaulted roof with an opening for light in the middle. Besides the two main rooms there are several galleries. After the close of the War excavations were pushed at Ostia and Pompeii. In addition to this many smaller, unimportant places had been more or less spasmodically dug. Possibly the most interesting work was in connection with the excavations at Pompeii where not only much interesting material was actually recovered but much that would otherwise have been lost was saved by the skillful use of plaster poured into the natural molds made by the volcanic deposit on the various objects covered by it. In this way it was possible to restore the appearance of such things as house doors, even to the bronze hinges, the nails, and the very grain of the wood. The same care was displayed in the reconstruction of houses, with the result that in several places it was possible to reconstruct the overhanging balconies and the window frames of the fronts of houses in such a way that much of the original appearance of the street was obtained. At Syracuse excavations were conducted on the site of the temple of Athene. Under the foundations of the building the Italians discovered traces of pre-Hellenic settlement. These remains were succeeded by early colonial Greek remains. In Spain, France, England, and Germany discoveries of minor importance were made from time to time, usually unpremeditatedly.

ARCHER, GLEASON LEONARD (1880-). An American lawyer and educator, born at Great Pond, Me., and educated at Boston University. He was admitted to the Massachusetts bar in 1906; in the same year he founded the Suffolk Law School, and became dean and treasurer. He was appointed chief arbitrator by the State of Massachusetts in the Springfield Street Railway dispute of 1914. He is author of *Law Office and Court Procedure* (1910), *Law of Contracts* (1911), *Law of Agency* (1915), *Law of Torts* (1916), *Equity and Trusts* (1918), *Law of Evidence* (1919), *Introduction to the Study of Law* (1919), and *Building a School* (1919).

ARCHER, WILLIAM (1856-1924). An English dramatic critic (see VOL. II). Within recent years Mr. Archer has ventured into play writing. *War is War* appeared in 1919 and *The Green Goddess* in 1921; the latter was produced by Winthrop Ames at the Booth Theatre in New York. It was a melodrama, and a popular success, although relatively of much less importance to the art of the drama than his critical work.

ARCHIBALD, RAYMOND CLARE (1875-). An American professor of mathematics and author, born in Colchester County, N. S., and educated at the University of Mt. Allison College, N. B.; Harvard University, the University of Berlin, the University of Strassburg, the Sorbonne, and the University of Rome. He began his career in Canada as professor of mathematics and in 1908 was called to Brown University. He was promoted to the rank of assistant professor of mathematics in 1911, and associate professor in 1917. In 1912 he was a delegate to the Congress of Universities of the British Empire in London. He was elected member of the Council of the American Mathematical Society in 1918, and librarian in 1921. In the latter year he became president of the Mathe-

mathematical Association of America. Besides contributing extensively to mathematical journals and reviews in Europe and America, he is author of *The Cardioid and Some of Its Related Curves* (1900), *A Bibliography of the Life and Works of Simon Stevin* (1905), *Carlyle's First Love* (Margaret Gordon, Lady Bannerman (New York, 1910)), *Mathematical Instruction in France* (1911), *Mathematical Instruction and the Professors of Mathematics in the French Lycées for Boys* (1912), *Euclid's Book on Divisions of Figures with a Restoration* (1916), *The Training of Teachers of Mathematics for the Secondary Schools of the Countries Represented in the International Commission on the Teaching of Mathematics* (1918). He was editor of the *Bulletin of the American Mathematical Society*, 1914-20, and of the *American Mathematical Monthly*, 1917-18, and became editor-in-chief of the latter in 1919.

ARCHIPENKO, ALEKSANDR PORFIRIEVICH (1887-). A Russian sculptor, esteemed the foremost of radical modernists. He was born at Kiev, studied two years at the Moscow Art School, and went to Paris at 20. But he was more influenced by the Byzantine art of his native land, the monumental sculpture of Egypt, archaic Greece and the Gothic, which he studied in the Louvre, and by Central American carvings. Rejecting Cubism, he aimed to achieve pure, abstract sculpture independent of natural form. His figures are slender and rhythmic, the heads unfinished and very small. His art is the embodiment of plastic absolutism. One of his innovations is to hollow out the parts of the figure he wishes to emphasize, which the imagination of the spectator is expected to fill; another is "sculpto-paintings" in which wood, metals and papiermache are combined in decorative panels. His school at Paris was dispersed by the War during which he worked at Nice. In 1921 he removed to Berlin, where he established an important school, and in 1924 to the United States. He is represented in 28 continental museums, including Berlin, Vienna, Frankfurt and Rotterdam, and Nisaka in Japan, and the Société Anonyme in New York. Compare his biography by Hans Hildebrandt (Berlin, 1923).

ARCHITECTURE. It was inevitable that the economic and emotional chaos that accompanied and followed the War should profoundly affect the architecture of all nations. There were neither materials nor men available for general building; and except in a few absolutely indispensable lines, building, and therefore architecture, the art of building, languished. Nor did architecture recover after the close of the War in 1918. Indeed, the confusion of economic policies that resulted all but killed the last dying embers, and forced deflation proved temporarily more disastrous to building than wartime stringency. This was true in both victor countries and defeated, the discussions between Germany and France with regard to the possibility of German labor and German materials being used directly for the rebuilding of the devastated areas in France, as part of the reparations payments, is but one of many indications of the direct result of post-war conditions on building and architecture. Little by little, however, adjustments have been made, and in one country after another the amount of building has increased until the United States, at least, has had a building boom which has gone far

to compensate for the necessary stagnation of wartime and post-war years. The economic results of the War have not stopped with the mere reduction of the amount of building. They include vast changes in the types of building produced and in the design of those types. It is this particular class of war results, which have led to the most striking movement in architecture during the past decade, a movement entirely international, as true of Germany as of England, France, and the United States. That is the immense impetus given to the so-called industrial housing question, in all its broadest implications of city planning and a deep study of its economic and sociological effects. See **CITY PLANNING and HOUSING.**

But the results of the War were not only economic; they affected the entire emotional life of the people as well, and that, in turn, affected all art. The idea of force cannot be paramount without entailing in art either on the one hand a sharp brutalism, or on the other, by compensation, a wishy-washy sentimentalism. Architecture was no exception, and where the sobering demands of a stark economy did not enter, as they so deeply do into housing, the results were either the extravagances of the secessionist movement—with its demand, heard often from critics who should have realized the temporary character of this unrepressed emotionalism, that art must be utterly personal, unaffected by tradition—or the equally sterile protest of those who blindly followed the past in the vain pursuit of a golden age. The end of the War, with its cumulative and almost universal disappointment of popular hopes, and its absolute demonstration of the futility of a national philosophy based on force, wrought a great change, reflected architecturally with surprising directness in the gradual modification of style ideas all over the world. The worst extremes of secessionism have been everywhere discredited. Even in Germany, where the doctrine of *Machtpolitik* had produced its most terrifically brutal expressions, design since the War, although free and untrammelled, is also, for the most part, quiet, restrained, and the best of it remarkably consistent with the general traditional forms of the country. This is typical of style development throughout the western world. There was a corresponding development in so-called conservative design. All over the world the strict classicism or strict Gothic of the "revival" spirit was finally killed by the War. Its artistic futility was too evident. Instead, there was developed a new realization of the fluid character of style; precedent was not neglected or tradition flouted, but neither were they worshipped. Classic or Gothic forms came to be accepted merely as a convenient vocabulary, to be modified, combined, and used or not as the designer's temperament or the demands of the problem required. It has come at last to be almost universally realized that in design it is not style that should control, but rather planning, mass-composition, and structural system.

United States. This style development can be seen at work with particular clarity in this country, because the amount of building has been so great. Between the creative Gothic of the Intercession Chapel or St. Thomas's in New York (both by Bertram Goodhue) or even the more conservative design for the nave of the New York Cathedral of St. John the Divine, by

Ralph Adams Cram, and the strictly archæological Gothic of much earlier church work, there is a great gulf. The architecture of the Panama-Pacific International Exposition at San Francisco in 1915 was prophetic of what was to come. In style throughout, whether in the conservative Court of the Universe, by McKim, Mead and White, or the radical Court of Abundance, by Louis C. Mullgardt, it shows how style itself is subordinated to the demands of pure design. It was the least archæological and at the same time the most colorful and imaginative of all American expositions. Style in America has had during the past decade several characteristic developments. Most notable among these has been the growing popularity of free versions of the Georgian or Colonial style for houses, schools, and smaller public buildings, such as town halls or libraries. Many houses of John Russell Pope, of H. T. Lindeberg, of Charles A. Platt, of Dwight James Baum, of Murphy and Dana, show this trend. The popularity of this style—a popularity founded on its fitness to the American climate and the American landscape as well as its traditional character—extended to larger buildings as well; the group of Johns Hopkins University, for instance, by Parker, Thomas and Rice, or the Waterbury Municipal Building, by Cass Gilbert.

Another interesting development is the growth of various local styles based on local climate, local materials, or special local traditions. The stonework of the neighborhood of Philadelphia is an example of a local style dependent on material; a very freely adapted Spanish Renaissance in California is a local style dependent on climate, and the forms of Indian Pueblo origin occasionally used in the Southwest is a local style dependent on local tradition. This is an important development, because it goes far to compensate for the deadening and unifying effect of the centralized manufacture of building materials by large industrial corporations whose market is nation-wide. There are other trends of almost universal scope in recent American design which deserve mention. The first is the increasing love for effects of dramatic climax produced by sharp contrasts of restrained surfaces with a few accents of richness. This is evidenced not only in all the best California houses of Spanish style (the Dater house, by Bertram Goodhue, and much work of Myron Hunt and William Templeton Johnson) but also in the Georgian work of the East (as, for example, the smaller houses of Dwight James Baum or the houses at Pelham Bay Gardens by Electus Litchfield). Another of these trends is the growing delight American architects take in the frank expression of materials. A higher standard of craftsmanship allows greater freedom in design. This development is specially marked in the use of rough or unusual textures in stucco walls, stonework and brick, and iron and bronze work, such as doors, grilles, and bank screens. The work of Samuel Yellin, of Philadelphia, in wrought iron is particularly noteworthy; and the results he has achieved have done much to raise the standard of architectural design in metal.

The two greatest and most marked achievements of American architecture during the decade were matters of larger implication. These were the development of a truer emotionalism and romance in design of all kinds and a new

grasp of the importance of a sense of form and mass. They are inextricably bound together, and both, strange as it may seem, owe not a little to the purely practical necessity of building in accordance with the new zoning laws which regulate building heights. New York's adoption of this type of building regulation served not only to improve the architectural standards of high building design by forcing a study of the interplay of big masses but has also been an example followed by an ever increasing number of American cities. The result has been the reëntry of shadow into architecture; mere decorated facades could no longer be depended on; detail became at once less important, and the piling of mass on mass, the governing composition, was seen as the important matter. True romance was the inevitable result. One of the finest examples of the effects produced by height regulation is the Shelton Hotel for men in New York City by Arthur Loomis Harmon (see ARCHITECTURE in the 1923 *New International Year Book*). The dominance of mass composition is also easily visible in all the best designs submitted in the Chicago *Tribune's* competition, particularly in the designs placed first and second, that of John M. Howells and Raymond Hood, and that of Eliel Saarinen, and in the honorable-mention design of the late Bertram Goodhue.

The great Lincoln Memorial in Washington, by the late Henry Bacon, illustrates the restrained emotionalism of modern American architecture. Built in a severe Greek style, it is nevertheless without coldness or academic monotony: instead its simplicity, its directness, its perfection of proportion, express perfectly the deep and quiet reverence in which the name of Lincoln is held. The same qualities of emotion characterized the winning design of H. Van Buren Magonigle in the competition for the Kansas City War Memorial, and to an even greater extent the piled mass of Bertram Goodhue's design for the same competition. A similar romantic yet unsentimental emotionalism is the most outstanding quality of Mr. Goodhue's design for the Nebraska State Capitol, now under construction. This is an epoch-marking building in American architecture, because of its perfect style freedom without a hint of eccentricity or sensationalism.

In new expressions for structural systems, advance has been less encouraging. The problem of the treatment of a steel frame so that the structure will be frankly expressed in the necessary fireproof covering is still unsolved, and it is perhaps unsolvable in the strict manner demanded by some logicians. Concrete remains a material of purely practical use; its treatment is still often a mere matter of engineering, and its architectural opportunities remain largely unknown. Exception must be made of a few serious attempts to find a true architectural expression for concrete; among these the Army Supply Base in Brooklyn, by Cass Gilbert, is preëminent. There are evidences, however, of a changing attitude toward architectural engineering. Many architects are growing disgusted with the method in vogue, by which the structural framework is hidden by an interior cage of wire lath and plaster that forms vaults and beams and entablatures having little or nothing to do with the actual construction. The attempt is growing to lay out structural members with a carefully planned

and definitely articulated relation to the desired interior effect, so that the structural form shall count, and to confine enrichment to surface decoration. But this movement is still in its infancy.

In the science of planning, the greatest advance has been made in the domain of popular housing. The acute housing crisis during the War forced the development, under the auspices of the Shipping Board and the Department of Labor, of many important housing developments, in which economy of space and materials was a governing factor. Minimum standards were set, and many excellent types of plan were evolved, in which waste space was absolutely eliminated. The combinations of standard plans and details in such a way as to give the maximum of livable variety was achieved in some of the developments to a remarkable degree. The most outstanding examples are York-ship Village, N. J., by Electus Litchfield, and several developments in and around Bridgeport, Conn., by Clipston Sturgis. It is an interesting fact that the direct result of the Bridgeport developments was the forming of the Bridgeport Housing Company, which is still building and selling low- and medium-priced houses whose architectural quality is exceptionally high. Yet the underlying economic questions are still unsettled. (See HOUSING). In this connection, mention must also be made of the Architects' Small House Service Bureau, a corporation developed under the auspices of the American Institute of Architects, whose purpose is the development of small house designs that shall combine economy with durable construction and high architectural quality. Its work so far has been principally in the West, but new divisions are being formed continuously, and the importance of the work it is doing, not only by the example of houses actually built, but also by the careful use of well planned publicity, cannot be overestimated.

In urban housing, similar advances in planning have been made. Economy has worked continuously to produce large-scale groupings, in which court spaces are concentrated to give additional light and air and in which corridors and halls are as far as possible eliminated. Andrew J. Thomas of New York has been a pioneer in this development and has produced some remarkable results, such as (with D. Everett Waid) the great group of cheap apartments for the Equitable Life Insurance Company and apartments of a more expensive type in Jackson Heights, N. Y. The work he has done here and elsewhere is certain to be the foundation on which later apartment house designers will build. In factory architecture, the United States has lagged. Comparatively few factories show any architectural study whatsoever, and in many which are "architectural," the design consists merely of an "architectural" dressing of the stark forms with detail, often of modernized Gothic type. Certain of the smaller plants and power houses have beauty of a sort due to the frank treatment of large windows, but of the true architectural mass composition of an entire factory group there has been surprisingly little. Development in the design of theatres, and particularly of moving picture theatres, has been marked. Not only has there come a mastery of the practical points involved, and the consequent development of a new type of theatre for moving pictures, but also there

has been a great liberation of decorative imagination. The best interiors are dramatic, gay, lavish, and well composed. In California, numerous interesting style experiments have been made. Particularly noticeable are Grauman's Hollywood Theatre, in Hollywood, by Meyer and Holler, done in a clever Egyptian style, and Grauman's enormous Metropolitan Theatre, in Los Angeles, by William Lee Wollett, which has a strange and imaginative interior in which classic eclecticism, modernism, the decorative treatment of concrete, and a queer symbolism all play their parts. It is a little incoherent but typically American and extremely effective.

England. The greatest English architectural achievements of the decade have been in the design of rural or suburban housing, in which English craftsmanship and traditional English cottage forms have the fullest scope. The number of examples of this type of work which possess a charm and vitality unknown in America is enormous, particularly when one considers the conditions under which they were erected. Developments in various suburbs by the London County Council, the City of Birmingham, and the City of Bristol are noteworthy; the London houses particularly are grouped into masses of delightful color, texture, and composition. Despite much criticism in England both of design and construction, English war and post-war housing seems to an American remarkable alike for economy and for beauty. The Well-Hall development, near Greenwich, is particularly lovely; despite the fact that it was built in the midst of the War, it has a variety, a truth to its tradition and environment, a livable quality, an unostentatious charm that make a total effect of real beauty. In public and commercial buildings, English architects seem to keep close to that habit of overornamented and restless classic fixed so deeply before the War. The London County Council Hall, by Ralph Knott, with W. E. Riley as consulting architect, is typical; it has a great colonnaded hemicycle, high roofs, many chimneys, heavy rustication, end-motives of huge arches filled with modernistic sculpture, that altogether produce an effect of unstudied chaos. Even the beautiful colonnade of the new wing of the British Museum by J. J. Burnet, completed in 1914, where an obvious attempt was made to follow the severe classic of the older Greek portion, has its effectiveness lessened by end motives insufficiently classic and monumental. Victory House, in London, by Trehearne and Norman; the Midland Adelphi Hotel, in Liverpool, by R. A. Atkinson, and the Regent Palace Hotel, in London, by Tanner, Wills, and Ansell, are all typical of this modern overlaid English classic.

Since the War there has been a development toward greater simplicity. The influence of modern American classic design is widespread. Moorgate Hall, London, by Richardson and Gill, is a typical example of this trend to simplicity; the building for Heal and Son, London, by Smith and Brewer, shows the same restraint despite its "new art" guise, and the lovely new buildings for University College in London, by F. M. Simpson, reveal this tendency toward a more restrained simplicity. In public buildings, the Cardiff Technical Schools, Cardiff, part of an ambitious civic centre layout, by Jones and Thomas; Australia House, London, by A. M. Mackenzie and A. G. R. Mackenzie, particularly in its lavish interiors; and the

building for the Metropolitan Water Board, by H. Austin Hall, all show an attempt to break away from the fashion of overdecorated richness. The Port of London Authority Building by T. Edwin Cooper is another outstanding attempt at monumental and restrained classic design. In the design of houses, English architects continued their successful free adaptations of the tradition that has made so many English houses models for reproduction elsewhere. Despite occasional eccentricities, English houses built since 1914 are of a high quality and remarkably in tone with their landscape, the work of Ernest Newton, Stanley Hamp, Ernest Willmot, T. Lawrence Dale, Robert Atkinson, and Guy Dawber has all the charm of homeliness, picturesqueness, a careful use of materials, and especially a harmony with environment and tradition, which have long characterized the best English domestic work. English churches are remarkable chiefly for their use of brick. Less and less purely Gothic work is produced, despite the very beautiful modern Gothic of the recent work in Liverpool Cathedral by G. Gilbert Scott; and more and more English architects are working out fresh forms based on the frank use of brick for both exterior and interior, with either stucco vaults or open timber ceilings. St. Cuthbert's Church, Copnor, Portsmouth, by F. Stanley Hall, is an example.

Modern English architecture in India deserves a brief notice. A serious attempt has been made to produce forms in harmony with the double tradition of British imperialism and of native Indian Mogul architecture. To blend these is exceptionally difficult. In the New High Courts at Allahabad, by Frank Leshman, the result has been a strange mixture of Indian and classic forms, not without impressiveness though not wholly convincing; but in the buildings for New Delhi, and particularly in the Secretariat, by Herbert Baker, greater simplicity has led to greater power and a new and dramatic beauty.

England has the honor of having the most impressive war memorial that the great War has yet produced. Its greatness is all the more remarkable because in size it is small, and in decoration restrained. And yet the Cenotaph in Whitehall, London, by Sir Edwin Lutyens, has, in the perfection of its simple form, an impressiveness, a dignity, and an emotional power that are marks of great architecture, and of great architecture alone.

France. French architecture during and since the War was going through a period of transition. The old quiet traditional classic that made Paris the most harmonious city in the world was passing, and there was as yet uncertainty as to what would take its place. Examples of it were still built, such as the building for the Messageries Maritimes, Paris, by St. Maurice, and the beautiful new work in the Hotel du Louvre, by Vaudroyer. Yet the old mastery is often gone. The French architect seems striving after something new and fresh. French War memorial schemes, without one exception, are characterized by this striving for originality, and sometimes the striving is forced and the results strained. The Verdun monument, on the other hand, attains tremendous and sombre grandeur in its use of "secessionist" forms. The same striving for originality is to be seen in the somewhat incoherent

Palais de la Mutualité in Paris by Bélesta, which, however, contains a meeting room of the most delicate beauty, decorated by Hannotin. The Ecole Nationale des Arts et Métiers of Paris, by G. Roussi, achieves repose and originality by the use of a fresh style whose roots in néo-grec can be easily seen, and the Musée de Paléontologie Humaine at Menton by Pontremoli, also has freshness, simplicity, and beauty, with an added interest given by a unique sculptured frieze.

Despite the uncertainty of French style developments to-day, French planning retains its old brilliance. This is particularly noticeable in the results of various town-planning competitions that have been held since the War. Particularly noteworthy is the great competition of the City of Paris for its enlargement and the design for the treatment of lands adjacent to the fortifications by Hébrard, Trévelas, and Dumail; and the plans for the City of Lille, by Gréber and Cordonnier. The most noteworthy monument of the housing agitation in France was the great competition of 1918 for house types to be used in the reconstruction of the devastated areas. Hundreds of designs were submitted, and in all the best traditionalism, the spirit of the particular locality, was allowed, rightly, to dominate. The result was that that tight, new-looking squareness which characterizes so much of the modern rural work in France was happily absent. Of actual constructed work, the Cité Jardins de Draveil, by Jean Walter, and the town of Le Trait, with its factories, docks, and workmen's houses, are especially noteworthy. The latter especially is an interesting attempt to compose, not a pure garden city, but a modern industrial city that shall nevertheless have its gardens and open spaces, and the great docks dominate the whole in a bold and picturesque fashion.

Germany. The two most outstanding facts in German architecture during the decade were the unexpectedly large amount of notable work produced under the most adverse and trying conditions, and the vitality, originality, and high quality of design. It is as if modern architecture in Germany had during the War grown out of the eccentricities of adolescence into a maturity that preserves originality but realizes the value of restraint. Almost all the old brutality is gone; the ostentatiously aggressive loudness and blatancy of the early twentieth century is dead. Instead, an innate traditionalism has again asserted itself, working in and through the new forms in most interesting ways. The Berlin Naval Offices, for instance, by Reinhardt and Süssenguth, is charmingly restrained, and its delicate shadows and curved roof lines are delightfully consistent with much late eighteenth century work. Yet there is no archaeology in the design; it is as free and original as it is delicate and restrained. The great Town Hall of Hanover shows the same influences. This characteristic combination of underlying traditionalism, and individual freedom and originality, governs most of the houses and housing of this period, as well as much school work. It is, however, in industrial and commercial buildings that German originality has found its most congenial field. Even before the War there had been built shops that had all the originality but none of the brutality of the current German official building, and since then development has been startling. The Waren-

Ragnar Oestberg, Architect

haus Wertheim, by Eugen Schmol, in Berlin, is typical; its bold yet quiet vertical lines and its lovely and intricate detail have just the right note of elegance. The great building of the "Nordstern" Insurance Company, Berlin, by Paul Mebes, has a truly Roman dignity, a grand monotony like that of the Colosseum that leads not to fatigue but to impressive beauty. The Automobilausstellungshalle, by Hans Richter, is simple, clear, expressive; and the railroad station at Oldenburg, by Mettegang, in dignity, beauty of proportion and detail, and expressiveness, is the equal of any station of its size anywhere.

It is in frankly industrial work that the Germans are preeminent. German architects are the only architects in the world who have realized to the full the possibilities of factory design as a whole. They have seen the problem not as a matter of a designed head-building with hidden ugly shops behind, but as a great opportunity for concerted mass-composition of the entire plant. Simplicity, direct expression, imagination, these serve to give often to modern German factories a new and thrilling beauty, closely allied to the new beauty of the best modern American building under the zoning laws. The Deutsches Bücherei at Leipzig is typical; the Kraftwerk Prinzengruben at Kottowitz, by Alfred Malpricht, is a remarkable piece of straightforward brick design, in which simple forms and towering chimneys give an effect truly romantic. The work of one man in this field is particularly remarkable—Hermann Muthesius, who seems to have a genius for being direct without ugliness, and original without eccentricity. The silk mills of Michels and Company at Nowawes show his imaginative and masterly handling of industrial forms,—but perhaps it is the great wireless station at Nauen in which his genius has achieved the simplest and most impressive results. In modern Germany alone has factory architecture received the attention it deserves or attained to any true and organized beauty.

Other Countries. Scandinavian work is characterized by the same combination of traditionalism and independence that dominates German architecture. In general, tradition is stronger in the Scandinavian countries; many delightful houses have resulted. The Gothenburg Exposition, by Bjerke, on the other hand, revealed individualism run riot. The Exposition buildings were interesting attempts to build counter to the prevailing tradition of overrich and overmonumental exposition building. They were frankly temporary; although they had an appealing simplicity, much of the detail seemed attenuated, effeminate, and unconvincing. In monumental work, the great Stockholm Town Hall by Ragnar Oestberg shows Swedish architecture at its best; the mosaicked Golden Hall in it is a unique and beautiful piece of modern interior design.

Holland produced some amazingly original designs; but although they possess verve and a certain picturesqueness, they seem often forced and outlandish, like some of the German work before the War. The Marine Hotel, in Amsterdam, by Von der May, and the Amsterdam Housing, by Klerk, are especially notable examples. The latter is a particularly interesting example of modern work in the variety it attains in one city block.

Much interesting modern work has been done

in Finland, so that Helsingfors to-day is one of the most interesting cities in Europe as an exhibition of frankly "modernist" architecture. The Railroad Station, by Eliel Saarinen, who was placed second in the Chicago *Tribune* competition, is particularly noteworthy.

Beyond spasmodic housing, Italy produced but little during the ten years. Austrian work is characterized by much of the same spirit as that of Germany, but classicism plays a more important rôle in Vienna than in Berlin. The Konzerthaus and Akademie für Musik is a typical piece of modern Austrian classic, and the Österreichische-Ungarische Bank by Leopold Bauer shows the typical Viennese classic of a freer and more original type. Since the end of the War there has been little building in Austria.

In the Orient, the struggle of East and West goes on, with disastrous architectural effects. The great port cities are rapidly assuming the air of an awkward European city, and all sorts of caricatures of western styles are produced by native architects. In China, to be sure, a certain vitality in native work is in evidence, connected with the Buddhist revival; but it is almost entirely confined to the rebuilding of temples destroyed during the Tai-Ping rebellion. The cultural chaos of the modern Orient has produced architectural conflict, and the future is uncertain.

ARCTIC REGION. See POLAR RESEARCH.

ARGENTINA. A South American republic lying on the eastern coast of the southern part of the continent, consisting of 14 provinces, 10 territories, and one federal district. Its area is 1,153,119 square miles, and its population (Jan. 1, 1921), 8,698,516. This represented a gain of 1,526,606 or 21.3 per cent over the official estimate of Jan. 1, 1911. The populations of the larger cities were estimated thus in June, 1922: Buenos Aires, 1,720,000; Rosario, 265,000; Córdoba, 156,000; La Plata, 151,000; Tucumán, 100,000. Because of the annual return of Spanish and Italian laborers to their homes after the harvests, immigration and emigration almost balanced, the numbers in 1917 being 51,665 immigrants to 83,999 emigrants; in 1919, 69,879 immigrants to 67,710 emigrants, and in 1920, 188,688 immigrants to 148,907 emigrants. The males still continued in excess of the females, the totals in 1918 being 4,440,367 males to 3,838,792 females. Immigration from Germany, Belgium, and the Slavic countries began to increase.

Agriculture. In 1920, out of a total area of 250,000,000 acres available for farming, 62,500,000 acres were being tilled. This was a gain of 12,170,000 acres, or 24 per cent, over the season of 1910. The following were the acreage, yield in metric tons, and quantity exported, of the leading crops for 1922-23:

	Acreage	Metric Tons	Tons exported
Wheat	15,939,494	5,145,031	3,964,641
Oats	2,617,854	797,967	283,205
Maize	7,850,750	3,890,000	2,771,325
Flax	4,111,793	1,124,769	925,958
Linseed			

Because of the virgin fertility of the soil, the food crop harvests were bountiful with the result that Argentina in late years led the world in the exportation of maize, as well as linseed, and stood next to the United States and Canada

in the exportation of wheat. The danger of sapping the soil was always real, and the government wisely applied itself to teaching the advantages of a more varied husbandry and intensive cultivation. This fact, together with the higher prices during the War, resulted in an increasing application to cotton, tobacco, and sugar cane culture.

The grazing industries of course stand next to agriculture in prominence. In 1920 there were 27,392,126 cattle (29,116,625 in 1908); 9,366,455 horses (7,531,376 in 1908); 825,226 asses and mules (750,125 in 1908); 45,303,419 sheep (67,211,754 in 1908); 4,670,130 goats (3,945,086 in 1908); 3,227,346 pigs (1,403,591 in 1908).

Industry. By the industrial census of 1920, 48,779 factories, employing 410,201 persons, with a capital of 1,787,662,000 pesos, were enumerated. The value of manufactured products was 1,861,789,710 pesos (\$782,000,000). The most important single industry was that of food production; 19,000 establishments were engaged in it. Packing plants, flour mills, creameries, and wool-washing plants were at the head.

Mining. This industry reached no great importance. Control of the mines was vested in the state and national governments, and concessions were strictly regulated. Petroleum was the most important of the products mined, the output of the Comodoro Rivadavia wells in 1921 being 1,730,500 barrels. During the War, wolfram and mica were in considerable demand.

Commerce. The total foreign trade of Argentina in recent years is shown below. The figures given represent the real rather than the nominal value adopted for tariff purposes and are stated in gold pesos with a par value in United States money of 96.5 cents per peso. In 1919, the average exchange value of the gold peso was \$.99; in 1920, \$.907; in 1921, \$.731, and in 1922, \$.818.

Year	Imports	Exports
1913	496,230,000	519,160,000
1919	655,772,000	1,030,965,000
1920	934,968,000	1,044,085,000
1921	749,534,000	671,129,000
1922	686,000,000	672,600,000

The chief articles imported were textiles, iron and steel, glassware and crockery, foodstuffs, oils, chemicals, timber and wood, and coal. The exports were chiefly foodstuffs, including wheat, corn, frozen beef and mutton, linseed, hides and skins, wool and quebracho. The United States advanced to a commanding position in Argentina's import trade, while the United Kingdom remained the best customer for Argentine exports. The trade with the more important countries for 1913 and 1920, the latest year for which details were available, are given in thousands of gold pesos.

Country	1913		1920	
	Imports	Exports	Imports	Exports
United States	73,013	22,895	310,395	154,136
United Kingdom	154,055	120,378	218,605	279,677
France	44,815	37,719	55,043	70,822
Italy	40,947	20,039	41,337	34,272
Brazil	10,898	24,309	50,435	22,407
Spain	14,582	4,818	49,068	14,639
Germany	83,934	57,915	44,620	23,756

For the 12 months ending June 30, 1923, the

United States exported goods to Argentina valued at \$109,384,460 as compared with \$80,495,064 for the same period of 1921-22. Imports from Argentina to the United States for the fiscal year 1922-23 totaled \$131,591,656 compared with \$60,767,964 in the preceding year. By July, 1923, it was evident that Argentina had emerged from the commercial depression that had started with 1921 and was rapidly on the way to a renewed economic activity.

Communications. After 1912, railroad building was retarded, only 1521 miles having been added by 1922. Work was under way on the Argentine section of the Trans-Andean railway designed to connect the Argentine state railway system from Salta, Argentina, with the port of Antofagasta, Chile, on the Pacific. On Jan. 1, 1923, of the total mileage, 3947 miles were state-owned, and 18,400 miles privately owned. In 1921, there were 52,470 miles of telegraph lines; 3619 post offices; and 12 stations for wireless telegraphy. Aerial communications were established between Buenos Aires and Salta, Catamarca, Posadas, and other cities, as well as with Montevideo, Uruguay.

Finance. The budget charges, in paper pesos, for 1912 and 1922, were as follows, one paper peso equaling 44 centavos gold money.

Year	Revenue	Expenditure
1912	128,751,718	248,764,912
1922	551,931,685	599,956,501

In 1922, the external debt was 561,537,364 paper pesos (\$239,000,000 at par), and the internal debt, 698,235,344 paper pesos (\$297,000,000). The floating debt was 628,836,663 paper pesos (\$267,000,000). An idea of the expansion of Argentina's activities may be gained from comparing the last charge with the 1911 figure of 34,004,123 paper pesos (\$14,477,000). The 1922 budget carried 128,736,485 paper pesos for interest and amortization of the debt; in 1911 the same item was about 70,000,000 paper pesos.

Education. In 1920, 1,121,311 pupils attended 9009 primary schools, 11,022 pupils were attending 38 secondary schools supported by the national government; 14,202 pupils were attending normal schools. The following new universities were organized after 1910: National University of the Litoral in Rosario (1920) and the provincial universities at Tucumán (1912) and Cuyo (1921). In 1920 the federal expenditure for education was 71,885,335 paper pesos, as compared with the 1911 figure of 19,200,000.

Defense. In 1910, two dreadnaughts were laid down in American yards. These, finished in 1917, were the *Moreno* and *Rivadavia*, both of 27,940 tons displacement and capable of 22.5 knots per hour. For 1922, the military budget was 48,812,937 paper pesos, and the naval budget 41,940,209 paper pesos.

History. The period of the War saw Argentina confronted by local problems in many ways analogous to those of the United States. The conflicting sympathies of the foreign-born population, many of whom returned to their native lands to fight in the armies; the active Allied and German propaganda; the rising cost of living; and the increasingly articulate character of labor, which expressed itself in strikes and disturbances; all added to the vexations of the government and distracted attention from mat-

ters which had hitherto been Argentina's main concern; i.e. its economic expansion and development. In 1917 a general railway strike temporarily paralyzed business, and sporadic strikes continued throughout 1918 and 1919.

Argentina's rôle as a neutral was made difficult in 1917 by the intensification of the German submarine campaign and the subsequent arrogance displayed by the German Foreign Office. The famous *spurlos versenkt* despatch of the German Ambassador, which the papers published on Sept. 8, 1917 ("I advise that they [Argentina's ships] be sunk without trace"), brought matters to a head, and after serious anti-German disturbances in Buenos Aires, the Argentine Congress voted for the severance of diplomatic relations. The President thereupon refused to intervene, and in spite of the entry of the United States into the War, Argentina remained aloof from the struggle.

In 1910 Roque Saenz Peña was elected President, and on his death in 1914, the Vice-President, de la Plaza, continued the term. In 1916 a split in the governing party caused the election of Hipólito Irigoyen, the Radical candidate, and Argentina viewed an administration of hitherto unknown men. Leaders in the new party included Honorio Pueyrredon, Diego Luis Molinari, Elpidio González, and Alfredo Demarchi. Business men and technicians were appointed to important offices, and civilians held the war and navy portfolios. In the Congressional elections of 1919 both houses remained Radical. The President's known sympathies for labor threw him into many difficulties, notably with the foreign-owned public service corporations. His able administration and his success in maintaining Argentina's neutrality won universal recognition for his talents. In 1922 Marcelo T. de Alvear, likewise of the radical party, was elected President.

The growing amity between Argentina and the United States was displayed by the number of loans placed with American bankers in spite of the competition of English capitalists, who, up to the War, had played the most important part in Argentina's industrial affairs. During 1922 and 1923 loans for \$27,000,000, \$50,000,000, and \$13,000,000 were floated. These borrowings reflected the most important problem before the Alvear administration; i.e. the unsatisfactory fiscal situation. One of the most pressing needs was the funding of the large deficits which were annually accumulating; in 1922 alone the deficit was 90,000,000 paper pesos. Another was the necessity for consolidating the floating loan. The solutions proposed by the government were radical: an income tax law, an upward revision of the tariff, double taxation for absentee landlords, higher land valuations, and a tax on bank deposits. In spite of its straitened finances, the government was moving toward an ambitious defense and public works policy, the budget for 1923 calling for 30,000,000 pesos for modernizing the navy and renewing army equipment, 300,000,000 pesos for railroad extensions, and 20,000,000 pesos for oil refineries.

Though Argentina was the first state to ratify the Covenant of the League of Nations, July 7, 1919, she withdrew from active participation in League affairs the following year, when the first League Assembly refused to take favorable action on the amendments to the Covenant proposed by the Argentine delegation, viz., admis-

sion of enemy states; admission, without vote, of very small quasi-sovereign states; compulsory jurisdiction for the Court; and systematic rotation of the members of the Assembly in the elective seats on the Council. Thenceforth the Argentine Republic refused to send delegates to Geneva and to pay its dues. In 1923 it was announced that Argentina meant to pay up arrears and assume an active rôle. See also NAVIES OF THE WORLD, and PAN-AMERICAN CONFERENCES.

ARGENTINE ANT. See ENTOMOLOGY, ECONOMIC.

ARIZONA. The fifth of the United States in size (113,956 square miles), and the forty-fifth in population; capital, Phoenix. During the decade 1910-20, the population of the State increased from 204,354 to 334,162, a gain of 63.5 per cent. The white population increased from 171,468 to 291,449, while the Negro population increased from 2009 to 8005, and the Indian population from 20,201 to 32,989. The Chinese in the State in 1920 numbered 1137, against 1305 in 1910; the Japanese, 515, against 301. The native white population increased from 124,644 to 213,350, while the foreign-born whites increased from 46,824 to 78,099. The urban population rose from 63,260 to 117,527, while the rural population increased from 141,094 to 216,635. The largest cities in the State are Phoenix and Tucson. The population of the former increasing from 11,134 to 29,053, while the population of the latter grew from 13,193 to 20,292.

Agriculture. Agriculture is not the leading industry in Arizona, nor did the agricultural development of this State keep pace with the growth of its population. This will be noted from the fact that while the increase in population in the decade 1910-20 was 63.5 per cent, the number of farms in the State increased only 8.1 per cent, from 9227 to 9975. It should be noted that in 1910 individual schedules were secured for farms on Indian reservations, whereas in 1920, in a number of cases where the farming operations of a reservation were returned on a single schedule, the reservation was recorded as one farm, a difference of at least 2000 farms being thus accounted for. The land in farms increased from 1,246,613 acres in 1910, to 5,802,126 acres in 1920, or 365.4 per cent. The improved land in farms also showed a considerable increase, from 350,173 acres to 712,803, or 103.6 per cent. The total value of farm property made an apparent increase of 210.9 per cent, from \$75,123,970 to \$233,592,989; the average value per farm, from \$8142 to \$23,418. In interpreting these values, and indeed all comparative values in the decade 1914-24, the inflation of the currency in the latter part of the period is to be taken into account. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. The proportion of land used for agricultural purposes in 1910 was 1.7 per cent, and in 1920, 8 per cent. The percentage of farm land improved decreased from 28.1 to 12.3. Of the total of 9975 farms in 1920, 7869 were operated by owners, 1801 by tenants, and 305 by managers, a decrease in the decade of about 400 farmers, and an increase of about 1000 tenants. The great proportion of farmers in Arizona are natives. In 1920 there were 8262 native white farmers and 1067 foreign-born. Indian farms

in 1910 numbered 3159; in 1920, 537 (but see above). The farms free from mortgage numbered 3708 in 1920, and 7038 in 1910, those under mortgage numbered 3380 and 1043. Arizona is one of the most important States in live stock production. Cattle in 1920 numbered 821,918, compared with 767,042 in 1910; but sheep decreased from 916,600 to 881,914. It is also one of the most arid States, and its possibilities for agriculture are controlled almost entirely by the development of irrigation. The number of farms irrigated in 1920 was 6605, compared with 4481 in 1910. The acreage irrigated increased from 320,051 in 1910 to 467,565 in 1920. Cotton growing came into considerable prominence in favored localities, notably the Salt River Valley. Fruit growing, especially of citrus fruits and grapes, increased, and vegetable growing for early market was developed locally. The estimated production of the chief farm crops for 1923 was as follows: corn, 898,000 bushels; wheat, 1,092,000 bushels; oats, 678,000 bushels; barley, 1,224,000 bushels; potatoes, 348,000 bushels; and hay, 607,000 tons. Comparative figures, for 1913, were corn, 476,000 bushels; wheat, 928,000 bushels; oats, 301,000 bushels; barley, 1,482,000 bushels; potatoes, 75,000 bushels; hay, 540,000 tons.

Mining. Arizona has a great wealth of mineral resources which have not as yet been fully developed. Its principal mineral products are copper, gold, silver, and asbestos. Of these, copper is by far the most important and valuable, and in its production Arizona far outranks any other State. The fluctuation in the value of copper during the War and post-War period was reflected in the copper situation of the State, as will be noted from the following comparative production figures: 1914, 393,017,400 pounds, valued at \$52,271,314; 1915, 450,972,295 pounds, \$80,495,152; 1916, 721,833,109, \$177,570,960; 1917, 712,166,891, \$194,421,561; 1918, 764,855,874, \$188,919,401; 1919, 538,100,844, \$100,086,757; 1920, 588,256,302, \$102,719,180; 1921, 185,034,194, \$23,869,411; 1922, approximately 400,043,128 pounds, valued at \$54,005,822. The peak of production was reached in 1918. The sharp decline from 1920 to 1922 resulted from the general business depression, which limited the demand for copper and also reduced its price. In 1922 there was a recovery, which continued in 1923. An estimate of production in 1923 was 624,000,000 pounds. The output of gold in the State remained practically constant in the decade 1913-23. The production in 1914 was 202,167 fine ounces, valued at \$4,179,155. After a slight decline in 1915 and 1916, it rose in 1917 to 245,174 fine ounces, valued at \$5,068,193, and in 1918, to 262,919 fine ounces, valued at \$5,435,027. The production for 1919-20 was practically the same. In 1921 the output was valued at \$2,930,303, and in 1922, at \$3,524,134. The decline in the last two years was due to the general depression in the mining field. Conditions greatly improved in 1923, however, and indications were that the output of gold in that year would be considerably increased, especially as several new ore bodies had been discovered. Since the silver output in Arizona is derived largely from treatment of the copper ores, it fluctuates with the production of copper. In 1914 the silver output was 4,377,994 fine ounces, valued at \$2,421,031; in 1917, 6,983,913 fine ounces, \$5,754,744; 1919, 5,266,605,

\$5,898,598; 1920, 5,355,303, \$5,837,280; 1921, 2,469,394, \$2,469,394; 1922, approximately 4,531,864 fine ounces, valued at \$4,531,864. As the Pittman Act, regulating the price at \$1 an ounce, expired in the latter part of 1923, every effort was made in the first part of that year to increase the production, and indications were that it would considerably surpass the production of 1922. Arizona is an important producer of lead. The production of this metal during the decade is indicated by the figures for several of the years: 1914, 15,003,068 pounds; 1917, 23,405,445; 1920, 14,599,765; 1921, 6,541,433; 1922, 15,070,894. A small amount of zinc is also produced, as well as a considerable quantity of asbestos. According to the State Geologist, the total production of the mines of Arizona from the beginning of mining to the beginning of 1923 was approximately as follows: copper, 9,966,150,966 pounds, gold, \$121,451,432, silver, \$143,801,602; lead, 140,117,828 pounds; zinc, 110,000,000 pounds; asbestos, 4000 tons; manganese ore, 40,000 tons; molybdenum, 750,000 pounds; precious stones, \$60,000. The total value of mineral production in 1921 was \$30,818,363, compared with \$116,383,335 in 1920, \$112,512,239 in 1919, \$203,992,915 in 1918, and \$60,420,362 in 1914.

Industries. Arizona is not an important manufacturing State, and its chief industries depend largely upon mining, having to do chiefly with smelting and other mineral processes. The growth of its industries from 1909 to 1919 is indicated by the following figures. The number of establishments in 1909 was 311; 1914, 322; 1919, 480. Persons engaged in manufacture in 1909 numbered 7202; 1914, 8014; 1919, 10,347. The capital invested amounted to \$32,872,935 in 1909; \$40,300,365 in 1914, and \$101,486,070 in 1919, while the value of the products in those years was \$50,250,694, \$64,089,510, and \$120,769,112, respectively. The large increase in the value of the products was due chiefly to the change in industrial conditions brought about by the War and therefore is no true measure of the growth of manufactures during the census periods. The most significant evidence of growth is found in the increase in the average number of wage earners and in the horse power used. The percentage of increase in the cost of materials, 135.8, as compared with that for the value of products, 88.4, resulted in an increase of only 13.4 per cent in value added by manufacture. This increase was due to the copper smelting and refining industries, which in 1919 contributed more than two-thirds of the total value of the products for the State. The value of the products of copper smelting and refining during the period was as follows: In 1909, \$41,059,000; 1914, \$53,438,000; 1919, \$94,184,000. Phoenix and Tucson, with 48.8 per cent of the total population of the State, reported 9.9 per cent of the State's products in 1919.

Education. Arizona has been from its earliest history one of the most progressive of the States in educational matters. The Legislature has willingly passed measures to improve the administration and efficiency of the school system. The fifth State Legislature enacted several measures of unusual importance. One of these established a new basis for the distribution of the State school fund and greatly increased its amount; another provided that

the rural schools shall receive from the county fund a minimum of \$1500 for each district employing one teacher and \$3000 for each district employing two teachers. A third measure gave greatly increased powers to the State Board of Education, especially with regard to the management of institutes and certification of teachers; and compulsory school attendance law was strengthened by a measure making possible stricter enforcement in rural districts. The most pressing problem in education in the State was the improvement of the rural schools. A definite step in that direction was taken in providing increased support and requiring higher teaching standards. A constitutional amendment providing for reorganization of the State Department of Education was defeated in the general election in November, 1922, but the discussion aroused by the measure was valuable in centring attention on the defects of the existing system. Vocational education as carried on through the State Board of Vocational Education. During the decade this board conducted very valuable research work and brought about a uniform accounting system for the schools. It also entered into a cooperative arrangement with some of the larger mines and industries of the State for part time class work in the evening for those who are employed. Classes had been organized in trade and industrial work with an enrollment of approximately 2000, and a similar arrangement was being worked out with the Farmers' Bureau of the State. Home economics has been extended into various communities, and a decided interest in the subject has been shown. The enrollment in the high and elementary schools in 1914-15 was 46,069. This had increased in 1922-23 to 69,077. In the high schools in 1921 the total enrollment was 6716. The expenditures from the State school fund for 1920-1 amounted to \$1,115,717, while the expenditures by school districts was \$4,449,883. The percentage of illiteracy in the State decreased from 21.9 in 1910 to 16.3 in 1920. Among the native whites it had apparently decreased from 2.4 in 1910 to 1.4 in 1920; among the Negro population, from 8.4 to 4.8; and among foreign-born whites, from 31.4 to 28.7.

Finance. For finance, see STATE FINANCES.

Political and Other Events. Several events of unusual importance marked the political history of Arizona during the decade 1914-24. In the elections of 1914 George W. P. Hunt was reelected governor and Marcus A. Smith to the United States Senate. A constitutional amendment providing for prohibition was carried by a majority of about 3000 votes. Two years later this amendment was amended and strengthened to meet a decision of the Federal court that the original amendment did not prohibit the introduction and personal use of intoxicating liquors. In the election of 1914 an initiated measure abolishing capital punishment was passed, but two years later the death penalty was restored. The Legislature of 1913 had passed a law prohibiting the owning of land by aliens. This was amended so that it applied only to aliens not eligible to citizenship and was later further amended by special reference to the Japanese prohibition of alien ownership in that empire, so as to be directly aimed at the Japanese. The Legislature of 1913 had passed a law requiring that mining com-

panies and other employers of large bodies of men in hazardous occupations should be limited to the employment of not more than 20 per cent who could not speak and understand the English language. This act was found by the United States Supreme Court two years later to be in violation of the Fourteenth Amendment. In the election of 1916, Thomas E. Campbell, Republican, was candidate for governor against George W. P. Hunt. The election was so close that a recount was necessary. Hunt refused to surrender the office on the face of the returns but a week later gave it up, pending the result of the recount, Campbell in the meantime having been declared by the Supreme Court to be governor de facto. The recount being decided in favor of Campbell, Hunt appealed, and in December of 1916 the Supreme Court reversed the lower court and seated Hunt. In the election of 1916 Henry F. Ashurst was reelected United States Senator. In the presidential election of 1916 Woodrow Wilson received 33,170 votes, compared with 20,524 for Charles E. Hughes. In 1918, Governor Campbell was reelected. He was reelected for a third term in 1920. In the presidential election of that year, W. G. Harding received 37,016 votes and James M. Cox 29,546. On the recommendation of Governor Campbell, a special session of the Legislature was called in April, 1922, and a State financial code was passed. This measure provided that appropriations for the government must be included in a single appropriation bill accompanying the governor's budget. In elections held in November of this year, the Democrats were universally successful. Senator Ashurst was reelected, and George W. P. Hunt was elected governor. Governor Hunt was inaugurated for the fourth time in January, 1923. In his address to the Legislature he laid special stress on the State's Educational problems and placed before the Legislature the Colorado River compact. This compact was negotiated by representatives of six States, New Mexico, Colorado, Nevada, Utah, Wyoming and Arizona. It was aimed to settle questions relating to flood control, power development and irrigation projects on this river. The Legislature failed to ratify the compact. In April, 1924, the Arizona memorial stone was dedicated at the Washington Monument in Washington.

Legislation. An attempt was made in the Legislature of 1915 to pass a substitute measure for the anti-alien laws, but the measure was defeated in the Senate. In 1917 the Legislature revised the laws relating to criminal procedure and provided for mothers' pensions. A special session in 1920 ratified the national woman suffrage amendment. In 1921, measures were passed creating a State child and welfare commission, a soldiers' land settlement commission, and an immigration commission. The Legislature of 1923 passed a law aimed especially at the Japanese, prohibiting the leasing of farm property to aliens ineligible to citizenship.

ARIZONA, UNIVERSITY OF. A coeducational State university at Tucson, Ariz. founded in 1885. The size and activities of the university broadened greatly between 1914 and 1923-24. In the latter year it included the College of Letters, Arts, and Sciences; College of Agriculture; College of Mines and Engineering, College of Education; School of Law; University

Extension Division; Steward Observatory; State Museum, and the Arizona Bureau of Mines. The student enrollment increased from 249 at the beginning of the decade, to 1750 for 1923-24, and 175 in the summer session of 1923. There was a corresponding increase in the faculty, from 43 to 118, and in the number of volumes in the library, from 20,000 to 60,000. Several new buildings were erected during the period: the agricultural building, mines and engineering building, Steward Observatory, the home economics practice house, the greenhouse for the agricultural experiment station, a dormitory for girls, and a dormitory for men. The new College of Education was organized in 1922. General public interest in the institution was shown by the gift of \$100,000 by mining interests to be added to a \$75,000 State appropriation for the erection of a mines and engineering building, and a gift of \$60,000 from Mrs. Lavina Steward, which made possible the erection of the observatory. Two changes were made in the presidency of the university. In the fall of 1914 Rufus Bernard von Klein Smid, A.M., Sc.D., succeeded A. H. Wilde, Ph.D., as president, and was succeeded in turn in 1922 by Cloyd H. Marvin, Ph.D., LL.D.

ARKANSAS. Arkansas is the twenty-sixth of the United States in size (53,335 square miles), and the twenty-fifth in population; capital, Little Rock. The population of the State increased during the decade 1910-20 from 1,574,449 to 1,752,204 or 11.3 per cent. The white population increased from 1,131,026 to 1,279,757, while the Negro population showed an increase from 442,891 to 472,220. The population of Arkansas is very largely native. The native whites numbered 1,265,782 in 1920 as compared with 1,114,117 in 1910, while the foreign-born population decreased from 16,909 to 13,975. The urban population rose from 202,681 to 290,497, while the rural population increased from 1,371,768 to 1,461,707. The largest cities in the State are Little Rock and Fort Smith. The population of the former increased from 45,941 in 1910 to 65,142 in 1920, and that of the latter from 23,975 to 28,870.

Agriculture. As Arkansas is an important cotton-growing State, agricultural conditions in the decade 1914-24 were affected, as in the case of the other southern States, by the devastations of the boll weevil. For a detailed account of the influence of the weevil on agriculture and cotton growing, see *ENTOMOLOGY, Economic: Boll Weevil*. In 1923, in certain districts of Arkansas, the leaf worm defoliated 95 to 98 per cent of the plants, which dried up, and the immature bolls produced practically no crop. The boll weevil attack, however, was less than in 1922, because conditions were less favorable for the insect. In spite of these handicaps, however, the area planted in cotton was practically constant during the decade. In 1913 this area was 2,502,000 acres, with a production of 1,073,000 bales; in 1915, 2,170,000 acres, 816,000 bales; in 1918, 2,991,000 acres, 987,000 bales; in 1921, 2,382,000 acres, 797,000 bales; and in 1922, 2,844,000 acres, 1,040,000 bales. In 1923 the estimated production was 926,000 bales.

While the population of Arkansas increased 11.3 per cent in the decade 1910-20, the number of farms increased 8.4 per cent (from 214,678 to 232,604). In 1910 the acreage in farms

was 17,416,075; in 1920, 17,456,750, an increase of only 0.2 per cent. The improved land in farms increased from 8,076,254 to 9,210,556 acres, or 14 per cent. The total value of farm property apparently increased from \$400,089,303 in 1910 to \$924,395,483 in 1920, and the average value of farm property from \$1804 to \$3974. In interpreting these values, and indeed all comparative values in the decade 1914-24, the inflation of the currency in the latter part of that period is to be taken into account. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. The total percentage of land used for agricultural purposes was 51.8 per cent in 1910 and 51.9 per cent in 1920, while the percentage of improved land increased from 46.4 to 52.8. Of the 232,604 farms in 1920, 112,647 were operated by owners, as compared with 106,649 in 1910; 736 by managers, as compared with 763; 119,221 by tenants, as compared with 107,266. There was an increase in the decade of about 6000 owners and about 12,000 tenants. The white farmers in 1920 numbered 160,322, as compared with 151,085 in 1910; colored farmers, 72,282 as compared with 63,593. The farms free from mortgage in 1920 numbered 64,881; in 1910, 82,321. Those under mortgage numbered 33,090 in 1920, compared with 22,374 in 1910. In 1920 the total number of cattle in the State was 1,072,966, compared with 1,028,071 in 1910; sheep numbered 100,159 in 1920 and 144,189 in 1910. The estimated production of the chief farm crops in 1923 was corn, 36,141,000 bushels; wheat, 770,000; oats, 6,584,000; rice, 5,254,000; potatoes, 1,764,000; sweet potatoes, 3,938,000; and hay, 563,000 tons. Comparative figures for 1913 are corn, 47,025,000 bushels; wheat, 1,313,000; oats, 6,360,000; rice, 3,769,000; potatoes, 1,800,000; and hay, 384,000 tons.

Mineral Production. Arkansas, while not one of the more important of the mineral producing States, has mineral resources of great value. The most notable feature of the mineral production of the State was the development of the petroleum field. The results of this development on a large scale were shown only as late as 1921, since previous to that time the reports of production were included with those of other States. In 1921 the oil production had reached 10,473,000 barrels, valued at \$12,746,000; and this increased in 1922 to 12,712,000 barrels. Coal mining ranked second in importance, and steadily increased in the decade 1914-1924. In 1914 the production was 1,836,540 tons, valued at \$3,158,168; in 1916, 1,994,915 tons, \$3,836,845; 1918, 2,227,369 tons, \$8,172,376; 1920, 2,103,596 tons, \$9,592,000; 1921, 1,227,777 tons, \$5,360,000. The output in 1922 was about 1,110,046 tons. Arkansas is chief among the States producing bauxite, from which aluminum is taken. The production in 1914 was 195,247 long tons, valued at \$976,686; 1916, 375,910 long tons, \$2,011,590; 1920, 481,279 long tons, \$2,897,892; 1922, 266,790 long tons, \$1,682,890. The total value of the mineral products of the State increased considerably in the decade, rising from \$5,787,199 in 1914, to \$14,081,691 in 1918 and \$22,515,412 in 1921. In addition to the minerals already mentioned, natural gas is important.

Manufactures. Arkansas is not an important manufacturing State, but there was a substantial increase in its industrial develop-

ment from 1909 to 1919. The number of establishments in 1909 was 2925; 2604 in 1914; and 3123 in 1919, while the number of persons engaged in manufacture in those years was 51,730, 48,440, and 58,202, respectively. The capital invested in 1909 amounted to \$70,174,345; in 1914, \$77,162,485, and in 1919, \$138,817,974. The value of the products apparently increased from \$74,916,367 in 1909, to \$83,940,587 in 1914, and \$200,312,858 in 1919. The increase of 1914-19 was due in great measure to the changes in industrial conditions brought about by the War. The principal industries, with the value of their product, in the three census periods, were as follows: lumber and timber products, 1909, \$40,640,000; 1914, \$43,115,000; 1919, \$91,852,000; cottonseed oil and meal, 1909, \$7,789,000; 1914, \$9,249,000, and 1919, \$25,304,000; car construction and repair, 1909, \$4,154,000; 1914, \$4,971,000, and 1919, \$11,030,000; rice cleaning and polishing, 1909, \$945,000; 1914, \$1,837,000, and 1919, \$8,996,000. The most important manufacturing cities of the State are Little Rock and Fort Smith. The former had 125 manufacturing establishments in 1909, 149 in 1914, and 242 in 1919; the value of their products was \$6,882,000, \$7,755,000, and \$23,168,000, in those respective years. Fort Smith, in 1909, had 83 manufacturing establishments, 103 in 1914, and 115 in 1919; the value of the products for those years was \$3,739,000, \$4,646,000, and \$14,813,000, respectively.

Education. Educational conditions in Arkansas showed a steady improvement in the decade 1913-23. Important local legislation was enacted during that time; and several important commissions and associations carried on work with excellent results. The Arkansas Illiteracy Commission undertook to give as speedily as possible to all adult illiterates in the State the opportunity of at least learning how to read and write; and the School Improvement Association was exerting its force in the life of many schools and communities in the State. In 1923 there were over 600 organized school improvement associations, with a membership of approximately 15,000. The Legislature of 1919 passed a measure accepting the provisions of the Smith-Hughes Federal Act, providing for vocational education, and levied a \$.0002 State tax for vocational educational work. Educational progress in the State is indicated by the fact that the enrollment in the schools increased from 395,978 in 1910 to 446,525 in 1916 and to 509,351 in 1922, while the average daily attendance increased from 255,135 in 1910 to 292,750 in 1916 and 367,516 in 1922. The census of the Bureau of Education, taken in 1919-20, showed an enrollment in the elementary and kindergarten schools of the State of 455,362, and in the secondary schools, 27,810, or a total enrollment of 483,172. This may be compared with the enrollment in 1922 of 509,351. The total enrollment in the white schools of the State in 1922 was 379,761 and in the colored schools, 129,600. The permanent school fund of the State in 1919-20 amounted to \$1,200,000. The total expenditures for schools in the same year was \$7,706,621; in 1922, \$8,946,237. The percentage of illiteracy in the State decreased from 15.1 in 1910 to 11.5 in 1920, the percentage among those of native white parentage decreasing from 8.5 to 5.7, and among the negroes from 32 to 26.5.

Finance. For finance, see STATE FINANCES.

Political and Other Events. No striking changes were effected in political conditions in Arkansas in the decade 1914-24. The State remained consistently Democratic. Elections were held in 1914 for governor and other State officers and for United States Senator. Governor Hays was reelected. On Jan. 1, 1916, State-wide prohibition went into effect as a result of laws passed by the Legislature of 1915. Senator Clarke died, Oct. 1, 1916, and W. F. Kirby was chosen as his successor. In the same election Charles H. Brough, Democrat, won the governorship. In the presidential election of that year, Woodrow Wilson received 112,282 votes and Charles E. Hughes 47,135. A proposed amendment substituting local option for State-wide prohibition was defeated, and another, for a new primary election law, was adopted. A constitutional convention created by the Legislature of 1917 met on November 19 of that year and after organization adjourned until July, 1918. The right to vote in primary elections was granted to women by the Legislature in 1917, and a "bone dry" amendment to the constitution was adopted. The constitutional convention held its sessions in 1918 and submitted a new constitution to the people, who defeated it in December. In the elections held in 1918, Governor Brough was reelected and J. T. Robinson was elected to the United States Senate. Three constitutional amendments submitted to the people at this election were defeated. Much activity resulted from the War, and between Apr. 1, 1917, and Oct. 30, 1918, Arkansas furnished 63,632 men to the military and naval forces. Camp Pike was established near Little Rock. In October, 1919, five white men and a larger number of negroes were killed in Phillips County, in troubles that resulted in collisions between armed whites and negroes. Five hundred United States troops were sent to the scene of the disorder from Camp Pike. As a result of these disturbances, 86 negroes were convicted on various charges and 12 condemned to death. In 1920, Thomas C. McRae was elected governor, and Thaddeus H. Caraway, Congressman, was elected United States Senator. In the presidential election of this year, James M. Cox received 105,618 votes, and W. G. Harding, 69,874. Constitutional amendments providing for changes in the initiative and referendum, equal suffrage, and an increase in the membership of the Supreme Court were carried; but as a majority of the total vote cast at the election of governor is required, and they failed to receive this, the amendments failed of adoption. In 1921 suit was instituted in the United States Supreme Court to settle a long-standing boundary dispute between Arkansas and Mississippi. In 1922, Governor McRae was reelected; a proposed amendment to the constitution, providing for a new initiative and referendum law, and other amendments relating to taxation and revenue, were defeated. In 1923 a special election was held for a successor to L. E. Sawyer, Congressman, deceased. J. B. Reed was the successful candidate. During this year strikes on the Missouri and North Arkansas Railroad were ended in December as a result of an agreement reached by the parties and the Governor. In January, 1923, serious rioting occurred in Harrison, and on January 18 a committee of 12 took charge of the situation. On May 14,

1923, flood and fire at Hot Springs did damage amounting to over \$20,000,000.

Legislation. Among the more important laws passed during the decade 1914-24 were the following: The Legislature of 1915 passed a State-wide prohibition bill and measures recommended by the commissioners on uniform State laws. In 1917 several amendments were passed in the Legislature, but, as noted above, they failed of adoption. In 1919 the Legislature adopted the prohibition amendment; at an extra session it adopted also the Federal suffrage amendment. At extra sessions many measures were passed to create special road improvement districts. In 1921 the Legislature abolished certain commissions and offices including the corporation commission and the paid penitentiary commission, substituting therefor the Arkansas Railroad Commission and an honorary penitentiary commission. At this session of the Legislature a resolution was adopted for an amendment to permit the taxation of personal property by improvement districts, but it was defeated at the polls. The Legislature of 1923 passed conservation measures for the protection of oil and gas lands, provided for instruction in patriotism in the public schools, made several amendments to the election laws; and passed a uniform stock transfer act.

ARKANSAS, UNIVERSITY OF. A coeducational State institution at Fayetteville, Ark., founded in 1871. Departments at Fayetteville are agriculture, engineering, liberal arts and sciences, and education. The medical department is at Little Rock. The enrollment increased from 665 in 1913 to 1257 for the year 1923-24 and 789 in the summer school of 1923; the faculty was increased approximately 42 per cent, from 80 to 114, and 10,000 volumes were added to the library, making a total number of 45,000 volumes at the end of 1923. Departments added during the decade were home economics, philosophy, journalism, secondary education, school administration, public speaking, agriculture, architecture, and an engineering experiment station. The tax levied for the support of the university was somewhat more than doubled, to \$.001. President, John Clinton Futrell, M.A., LL.D.

ARLISS, GEORGE (1868-). An English-American actor born in London, England, where he was educated. He made his first appearance on the English stage at the Elephant and Castle Theatre, London, in 1887, and subsequently toured in America with Mrs. Patrick Campbell's company. He has played with Blanche Bates, Mrs. Fiske, and other prominent stage artists. Some of his best performances have been in *The Darling of the Gods*, *Leah Kleschna*, *The Devil*, *Disraeli* and *The Green Goddess* (1921). He has also played leading rôles in several successful screen productions and is the author of *Widow's Weeds*, *There and Back*, *The West End*, *The Wild Rabbit*, *What Shall It Profit?* (with Brander Matthews), and *Hamilton* (with Mary P. Hamilton; 1917).

ARMAMENTS, LIMITATION OF. See WASHINGTON CONFERENCE. For effect on naval design and shipbuilding, see VESSEL, NAVAL; NAVIES; SHIPBUILDING, NAVAL.

ARMENIA. Armenia, as the term was generally employed before the War, did not designate a sovereign state. There was no Armenian state in modern times until the Ar-

menian Republic of Erivan arose in 1918. What the name did signify was portions of Turkey, Russia, and Persia inhabited by Armenians. In the six Armenian vilayets of Turkey, i.e. Erzerum, Van, Bitlis, Diarbekr, Mamut-el-Aziz, and Sivas, lived approximately 1,000,000 Armenians, scattered among more than 3,000,000 Kurds, Turks, and other races, chiefly Moslems. Cilicia, styled Lesser Armenia by nationalists, was also claimed by virtue of historical tradition and a large Armenian population. Russian Transcaucasia, chiefly the provinces of Erivan, Elisavetpol and Tiflis, included something over 1,000,000 Armenians, mingled with other races. In addition, perhaps 150,000 Armenians dwelt in northwestern Persia, wherefore the Persian province of Azerbaijan was often included in nationalist dreams of a greater Armenia. Throughout this large area, held under three sovereignties, the Armenians constituted only a minority, if the total population be considered, and only in relatively few districts outnumbered other races. Yet national consciousness, fanned into life by contact with western civilization, demanded independence and unity, insuperable though the obstacles appeared. After the outbreak of the War, the Young Turk government charged the Armenians with pro-Ally sympathy and revolutionary purposes, and on this pretext, the Turks began a brutal and systematic campaign of extirpation and banishment. Massacres took place in the centres where groups of Armenians were to be found, in Bitlis, Sivas, Kharpout, and Trebizond. Deported to Syria, Arabia, and Mesopotamia, and gathered in huge concentration camps, they suffered all the privations of hunger and lack of shelter, and they died in great numbers. From 1,000,000 to 1,200,000 were deported, and of these at least half met death by actual murder or as a result of neglect. Many thousands sought shelter in Russian Transcaucasia, and large numbers of the male population fought in the Russian armies. Their war losses must have totaled 100,000.

The Russian advance into Asia Minor in 1915-16 and the fall of Erzerum served to distract the Turks and was the means of saving many Armenians. But the collapse of Russia in 1917 and the Treaty of Brest-Litovsk in 1918 placed the Armenians at the mercy of the Turks once more. The Armenians in Transcaucasia tried to halt the ruin that awaited them by creating the Republic of Erivan, but the Turks swept into Transcaucasia in the spring of 1918, and only the Armistice in the autumn saved the remnants of the Armenians from complete obliteration. The Peace Conference seemed favorable to Armenian hopes. An Armenian delegation, composed of Russian and Turkish Armenians, laid their people's aspirations before the Supreme Council. The creation of an independent Armenia in the midst of Turkish territory, no matter how just, was beset by many difficulties, and attempts were made to induce the United States to accept a mandate over it. The refusal of the American people to involve themselves in Eastern politics and intrigue delayed the settlement of the Armenian question until the completion of the Treaty of Sévres. By this instrument a greater Armenia in Russia and Turkey was provided for in 1920 and President Wilson was chosen to map out the confines of the territory in Turkey. President Wilson made public his

decision in March, 1921, three months after Erivan had fallen before Turkish and Russian invaders. By the Wilson line Armenia was given some 30,000 square miles in the Turkish vilayets of Trebizond, Erzerum, Bitlis, and Van, a coast-line of 150 miles on the Black Sea, and the port of Trebizond. It was a fair enough award, but unfortunately, it was conditioned on the capability of the Armenians to take possession. Their inability to do this, the appearance of the Turkish Nationalist government at Angora, the alliance between Bolshevik Russia and Nationalist Turkey, the helplessness of the European powers who dared not embark on a new war, rendered nugatory the Treaty of Sevres and wrecked all hopes for an independent Armenia. Meanwhile the entry into Erivan of the Bolsheviks and the creation of a Soviet Republic, Dec. 2, 1920, heightened the indifference of the Allies.

Almost the last hope of the Armenians fell with the evacuation of Cilicia (q.v.) by the French in 1921. In 1919-20 about 500,000 Armenians, placing their faith in French aid, had pushed into Cilicia and put themselves under the protection of French arms. But the Turkish Nationalists turned on the French in force, invaded Cilicia, and took their usual vengeance on the Armenians. It is estimated that 25,000 of them perished here in 1920. The Franco-Turkish Treaty of Oct 20, 1921, provided for the departure of the French forces, abandoning the Armenians. Finally in 1923 the last chapter was written. By the Treaty of Lausanne a perplexed and war-weary Europe sought relief through the restoration of the status quo, and Turkey in Asia Minor was left intact. The roseate promise of an independent Armenian State was now definitely ended and the Armenians were again Russian, Turkish, and Persian subjects.

Armenian Republic of Erivan. Since 1918 a state belonging to the Transcaucasian Federation and affiliated with the Union of Socialist and Soviet republics. The republic, made up of the former Russian government of Erivan, is, like Georgia and Azerbaijan, situated on the Transcaucasian peninsula and has an estimated area of 15,092 square miles and a population, according to the latest Russian census, of 1,214,319 as against 1,184,600 in 1914. Eighty per cent of the population was rural. The population was largely Armenian and Christian, about 60 per cent, while minorities of Turco-Tatars, Russians, Greeks, Kurds, and Georgians were also to be found. Erivan, the capital, had a population of 110,000; Alexandropol, 70,000. A university with but one faculty, however, was opened at Erivan in 1920.

Industry and Trade. Agriculture engaged the great proportion of the population, wheat, rice, licorice root, tobacco, and wine being the leading products. Prior to the War, Armenia produced up to 150,000 bales of ginned cotton annually, but cotton growing decayed completely after the Bolshevik Revolution. Mining made up the most important economic activity before the War, for here were found copper ore, rock salt, and iron pyrite deposits. In fact, before the War, the Government of Erivan produced 20 per cent of Russia's whole copper output. From 18,000 to 20,000 tons of salt were extracted annually, 6500 tons of copper, and 50,000 tons of iron pyrites. Three-quarters of the mines, however, had no access to rail-

roads. Actually, having no seafront, the country was almost wholly cut off from contact with the outside world, and being compelled to depend for its communications on the single Transcaucasian railway that passed through its territory on the way from Batum to Baku. The country had great industrial possibilities, for it was estimated that 9,000,000 h.p. could be utilized from the water courses.

History. The destinies of Armenians were, after all, to be cast in with the lot of Russia and not the West or the United States. Five days after the collapse of the Russian Empire, on Sept 20, 1917, Armenia, with Georgia and Azerbaijan, established the Federal Republic of Transcaucasia. The career of this federation was stormy; the sympathies of its members indicated marked dissimilarities; and a break, hastened by the Turkish invasion of Transcaucasia in the spring of 1918, came on May 26-28, 1918. War-torn Erivan was evacuated by the Turks late in 1918; a brief respite followed; and then hostilities were renewed, this time with Georgia, in January, 1919. Meanwhile, without the formality of a popular election, a government keenly nationalistic in tone had been created at Erivan in the Russian Armenian provinces, by the Dashnakzagan party (moderate or Menshevist Socialist), and the country was organized not for reconstruction and peace, but for expansion and war. The Turks and the Kurds were the enemies. Encouraged by the fair promises of the Allied statesmen to believe that Armenia, like Poland, was to be regenerated, Armenians fell easy prey to the war temper. In July, 1919, a high commissioner was despatched to Armenia, and credits were extended to the Dashnakzagan government; in August, Major-General Harbord appeared to ascertain the possibilities of an American mandate over the country; on Apr. 23, 1920, the government was formally recognized by the United States; three days later, the San Remo Conference called on President Wilson to delimit the boundaries of a free and Greater Armenia. No power, however, seemed willing to assume a mandate over Armenia or to give the struggling republic of Erivan the aid of which it stood sorely in need; British troops, having temporarily occupied the region in the winter of 1917-18, had been withdrawn in the following summer, to be replaced by Allied troops after the armistice, which in turn had been evacuated in 1920. The United States Senate, unwilling to follow President Wilson's generous impulse, refused to consider a United States mandate. Britain and France were equally reluctant. Although alternative plans, such as protection by the League of Nations, were discussed, Armenia was left to its own slender resources and extravagant pretensions. Somewhat unreal, therefore, were the paper promises contained in the Treaty of Sevres of Aug. 10, 1920, whereby, out of the major portions of the Turkish vilayets of Van, Bitlis, Erzerum, and Trebizond, a republic was to be erected, and the final act, the drawing of the frontiers on the West, was delegated to President Wilson. It was merely necessary for Armenians to take possession, without aid from the Allies, it is true, but with their good wishes. A general mobilization was ordered, 34,000 men were collected, and a move was commenced on the Turkish provinces by bands of unskilled, undernourished men. To defeat them was a

surprisingly easy task. Kars fell without a struggle, Oct. 31, 1920; a week later, Alexandropol was entered. By Nov 7, 1920, when a Turco-Armenian armistice was signed, not only were Armenians in flight from the Turkish provinces, but they saw Erivan wholly occupied by the Nationalist Turks. The conduct of the latter was typical: for the six months the country remained in their possession, 140 towns were destroyed, 400,000 people were rendered homeless, the countryside was stripped of every plow, horse, ox, and milch cow. It was Russia, and not the United States or Great Britain, that was able to save something of the Armenian hopes. Meanwhile the Russian Bolsheviks, now acting more or less in concert with the Turks, had massed 10,000 Red troopers at Akstafa on the Northwest frontier, invaded the country, and coöperated with Armenian Bolsheviks in setting up a Soviet Republic. The new government at once signed a provisional treaty at Alexandropol on Dec. 2 with the Turkish Nationalist commander, Kiazym Kara Bekir Pasha. This treaty handed over to Turkey the districts of Kars and Ardahan and renounced all claim to Turkish Armenia. This disaster was confirmed by the Russo-Turkish treaty of Moscow in March, 1921, and by the treaty arranged at Kars the following October between Turkey and the Transcaucasian republics. The temporary restoration of the districts of Karabagh, Zangezoor, and Nakhitchewan to Armenia was but an ephemeral and inadequate consolation. A final effort of the Dashnakzagan party to regain power was unsuccessful. On Feb. 18, 1921, through a *coup d'état* Erivan was seized, but by April 2, the party was in flight, and the Soviet reestablished. On April 21, the Turks evacuated what remained of the republic; on October 13, in the above mentioned Treaty of Kars, Armenia was recognized by Turkey. Russian aid was profuse but, in the face of the great suffering, ineffective. In 1921, as a result of the evacuation of Cilicia (q.v.) by the French, it was reported that Erivan was filled with 400,000 Turkish Armenian refugees. Russia sent clothing, agricultural implements, 1,500,000 gold rubles for the purchase of grains and animals from Persia, medicines and nurses; yet in 1922 alone the death toll in Erivan was 150,000 from starvation and cholera. There was, during 1922-24, an application to local problems purely, for under the Soviet leaders the hope of the greater Armenia had been forsaken: the Armenian national home was in Erivan. Kars, Ardahan, and the Armenian vilayets of the former Ottoman Empire had definitely reverted to Turkey, and Turkish possession of them was tacitly recognized by the Allies when they signed the Treaty of Lausanne with Turkey in 1923, from which the Sevres clauses on Armenia were quietly omitted. Nor was the tiny Republic of Erivan itself really independent. From the Red invasion, it had been overshadowed by the power of Moscow, and at the end of 1921 it had been reintegrated in a Federal Transcaucasian Republic which entered into the Alliance of Socialist Soviet Republics, dominated by Moscow, by the treaty of Dec. 30, 1922. See RUSSIA, and WAR IN EUROPE, *Turkish Front*.

ARMIES AND ARMY ORGANIZATION.

Military organization comprises the correct and systematic arrangement of the man power and economic resources of a nation to provide that

unity of effort essential to success in war. It is employed to carry out the military policy of a nation, which is formulated for the protection and promotion of its national policies. Military organization is divided into the organization of land forces whose mission it is to carry out in the field the military policy of the nation, and the organization of noncombatants and of industries to provide equipment, munitions and supplies to enable the land forces to fulfill their mission. Previous to the War the major European powers and Japan in the Far East had carried military organization to a high degree of development, while the United States, with no definite military policy, was in a period of transition.

During the first three years of the War, the increase in fire power due to improvement in rifles and machine guns, the increased mobility and rate of fire of heavy artillery, the development of aeroplanes not only for observation and reconnoissance but for bombing and combat, the introduction of grenades, light mortars and tanks, and the utilization of gas and other chemical agencies, gave rise to the formation of small units to take advantage of these additional tactical opportunities, but resulted in no radical reorganization either by the Central Powers or the Allies. In the United States, during this period, trouble with Mexico caused the mobilization of a large part of the Regular Army and the National Guard on the Mexican border and the organization of an expeditionary force which conducted a campaign in Mexican territory. There resulted a grouping of units which made possible some training and experience in the manoeuvring and supply of larger units, and although little or no definite preparation was made for the possible contingency of entry into the War, the foundation was laid for the expansion which became necessary after that contingency materialized.

The establishment of Military Training Camps, first for college students and then for business men in 1915 and 1916, resulted in the partial training of many citizens who formed the nucleus of the body of officers required when the emergency arrived. When the United States entered the War it became apparent that the forces to be raised should be organized and equipped to utilize to the fullest extent the newly developed weapons and should conform as far as practicable to the organization of the Allies' forces, in conjunction with which the troops would operate. The available forces at the outbreak of the War were the Regular Army and the National Guard, but the prompt enactment of the Selective Service Act provided means for expanding these forces to war strength beyond the natural expansion by enlistment and for the creation of new units to the full extent of the man power of the nation.

The armed forces of the United States were, therefore, organized primarily into three components: first, the Regular Army; secondly, the National Guard; and thirdly, the National Army. The last was provided with officers in the higher commands from the Regular Army and in the lower grades from the officers' reserve corps and from graduates of officers' training camps which were immediately established. These forces were all organized under new tables of organization prepared after a study

of the organization of the Allied armies; the basic unit was a division of some 28,000 officers and men. The division was made up of a division headquarters, two infantry brigades, a field artillery brigade, a division machine gun battalion, a field signal battalion, an engineer regiment, and divisional trains. An infantry brigade was composed of a headquarters, two infantry regiments, and one machine gun battalion. The artillery brigade was composed of a headquarters, two 75 millimeter gun regiments, one 155 millimeter howitzer regiment, and a trench mortar battery. An infantry regiment was composed of a headquarters and three battalions with four rifle companies of 250 men, a supply company, and a machine gun company, each. An artillery regiment comprised a headquarters and two battalions of three four-gun batteries, a headquarters company and a supply company, each. An engineer regiment was composed of a headquarters and two battalions with three companies of 250 men each. The divisional trains comprised a headquarters and military police company, an ammunition train, a supply train, an engineer train, usually attached to the engineer regiment, a sanitary train, and a mobile ordnance repair shop, attached to the ammunition train.

The road space occupied by a division was $30\frac{1}{4}$ miles with foot troops marching in column of squads.

General headquarters, reserve, army, and corps troops comprising heavy artillery units, engineer units of various kinds, pioneer infantry, and service units, were organized and assigned as required and as they were available. Engineer, quartermaster, signal, and various other special units were organized for service in the base and intermediate zones and along the lines of communication. The divisions so organized proved unwieldy and lacked mobility, their transportation was complicated, their entry into and withdrawal from battle was difficult, deployment was retarded, and the smaller units could not be adequately supervised by the division commander and his staff. They had great striking and penetration power and under the conditions on the Allied front they proved very effective. In 1920 the National Defense Act of 1916 was thoroughly revised in the light of war experience, and a definite military policy for National defense was adopted; provision was made for the maintenance of a small and highly trained peace establishment consisting of the Regular Army, the National Guard and the organized reserves, all so organized and trained as to be readily expanded to war strength in emergency. Provision was further made for voluntary military training of citizens through reserve officers' training corps established at various high schools, colleges and universities, and by means of annual civilian military training camps.

The Regular Army constitutes a permanent military force. Its peace-time strength was limited by Congress in 1924 to 12,000 officers and 125,000 enlisted men. The National Guard is, first, the organized militia of the State to which it belongs, and secondly, a component of the army of the United States in time of war. The National Guard is so organized and trained under supervision of the Federal authorities that when mobilized in time of war it will constitute with the Regular Army the first line of defense. The organized re-

serves, comprising the officers' reserve corps and the enlisted reserve corps, composed of citizens who voluntarily accept commissions or enlistments, are grouped into skeleton organizations for rapid expansion in time of war. In time of peace the regular army, the National Guard and the organized reserves are organized, so far as practicable, into brigades and divisions, and for purposes of administration, training and tactical control, the continental area of the United States in 1924 was divided on a basis of military population into nine corps areas. The Regular Army, owing to its limited strength, is assigned to the corps areas according to military necessities; the National Guard and the organized reserves are distributed so that each corps area contains two divisions of the National Guard and three divisions of organized reserves and various corps and army troops. In a major emergency the complete mobilization would provide land forces consisting of six field armies with a total of 2,000,000 men, each corps area furnishing one Regular Army division, two National Guard divisions and three organized reserve divisions and corps and army troops according to their varying military population, skeletonized units being brought to war strength by enlistment and the operation of selective service. In a major emergency mobilization would be effected progressively, the Regular Army and the National Guard being first mobilized and moved to the theatre of operations, followed by the mobilization of the reserves, including the necessary troops for lines of communication and the interior.

The amended National Defense Act of 1920 further provided for the organization of a general staff in the War Department, modeled after the general staff which operated in France with the American Expeditionary Forces during the War. It consists of the chief of staff, a deputy chief of staff, and four divisions dealing with personnel, intelligence, operations and training, and supply: these divisions are designated, respectively, G-1, G-2, G-3, and G-4. The duties of the general staff, as defined in the Act, are to prepare plans for national defense and the use of the military forces for that purpose, and for the mobilization of the manhood of the nation and its material resources in emergency, to investigate and report on all questions affecting the efficiency of the army of the United States and its state of preparation for military operations, and to render professional aid and assistance to the Secretary of War and the chief of staff. To carry out one phase of these duties a war plans division has been constituted, to study and develop plans for defense; this is so organized that in case of a major emergency it could take the field as the staff of general headquarters in the theatre of operations. In time of peace, command and administration are carried out through the nine corps areas; no commanders are appointed or staffs organized for units greater than a division.

Subsequent to the adoption of the amended National Defense Act of 1920, a board of officers was assembled who defined a general plan of organization for the army of the United States as provided for in the Act. The strategical and tactical organization of the military forces, it was recognized, might include a general headquarters, groups of armies, corps or divi-

sions, depending on the theatre of operation, the general strategical situation and the size of the forces engaged. Under the plans outlined by the special board of officers, tables of organization were prepared by the general staff and put into operation. Tables were prepared for such general headquarters reserve, army, and corps troops as might be required in a major emergency, and which should be included in the organized reserves. A typical organization of an army comprises two or more corps temporarily assigned; two cavalry divisions; heavy artillery from the general headquarters reserve; a brigade of anti-aircraft artillery; an air service consisting of headquarters, an observation group, and an attack wing; and certain special troops of the signal corps, engineer corps, medical corps, and Ordnance corps, with the requisite trains. A typical organization of a corps comprises two or more divisions temporarily assigned, an artillery brigade of three regiments of 155 millimeter howitzers and a regiment of 155 millimeter guns, with an observation (flash) battalion and an ammunition train, an air service of two observation squadrons and four balloon companies, an anti-aircraft regiment, a medical regiment, an engineer regiment with three auxiliary battalions, and the requisite trains.

In order to meet the objections to the division as organized during the War, the new tables of organization provided for a reduction in strength to about 20,000 officers and men. This reduction was secured by transferring the regiment of heavy artillery to the corps, reducing the strength of the companies in the engineer regiment to 100 men and the strength of a rifle company in an infantry regiment to 200 men, with a corresponding reduction in the number of machine guns, but leaving the percentage of machine guns to rifles the same. This reduction in strength was in line with the changes in European armies based on the experience of the War. A division so organized still occupies a road space with foot troops marching in columns of squads of about 27 miles, and it is probable that further reduction in the strength of a division will be made in the future, without making any reduction in the strength of a battalion.

The retention of the two-brigade four-regiment organization has to a certain extent sacrificed manœuvring and mobility to striking power, but in view of the modern tactics of organization in depth, the three-unit scheme was not adopted until the battalion was reached in organization. Since it was recognized that the machine gun was purely an infantry weapon, the machine gun battalions of the former organization were abandoned, and machine gun companies were organized in each battalion.

An infantry division as now organized comprises two infantry brigades of two regiments each, a field artillery brigade of two regiments of 75 millimeter guns, one combat regiment of engineers, an observation air squadron, a medical regiment, and special troops consisting of a signal company, a light tank company, an ordnance company, a service company, a military police company, and the requisite trains. A cavalry division comprises two cavalry brigades, each having two regiments and a machine gun squadron; a battalion of horse artillery of 75 millimeter guns; a combat en-

gineer battalion, mounted; an ambulance company, and the requisite trains. An infantry regiment comprises a headquarters, a service company, a howitzer company; three battalions, each of three rifle companies; and a machine gun company. An artillery regiment comprises a headquarters, a headquarters battery, a service battery, and two battalions of three batteries and one combat train each. A cavalry regiment comprises a headquarters, a headquarters troop, a service troop, and two squadrons of three troops each. An engineer regiment comprises a headquarters, a headquarters and service company, including the engineer train, and two battalions of three companies each. A medical regiment comprises a headquarters, a service company, a collecting battalion of three companies, an ambulance battalion of one animal-drawn ambulance company and two motorized ambulance companies, a hospital battalion of three motorized hospital companies, and a veterinary company.

The increase in strength of units and the addition of new and improved weapons have made increasingly difficult the problem of supervision and administration; consequently tables of organization now provide for staff officers with functions similar to general staff officers down to and including battalions, except that in brigades, regiments, and battalions the functions of the adjutant and the personnel division are combined under one officer. To provide trained officers for staff positions the National Defense Act has directed the formation of an eligible general staff list composed of officers of suitable training and experience and all staff appointments in the larger units down to and including divisions are made from this list. See ARTILLERY; STRATEGY AND TACTICS.

ARMIN, FRIEDRICH SIXT VON (1851-). A German general, born at Wetzlar. In 1917 he was appointed Chief-in-Command of the Fourth Army in Flanders which, in 1918, took Armentières and Kemmel Hill. See WAR IN EUROPE, *Western Front*.

ARMISTICE, THE. See WAR IN EUROPE, *Western Front*.

ARMISTICES. See WAR, DIPLOMACY OF THE.

ARMORED CRUISER. See VESSEL, NAVAL.

ARMORED SHIP. See VESSEL, NAVAL.

ARMOUR, (JONATHAN) OGDEN (1863-). An American capitalist and merchant born in Milwaukee, Wis. He left Yale University in 1883 to enter his father's business, Armour and Company, one of the "Big Five" packers of the United States. After Armour became head of the company in 1901, sales grew approximately from \$250,000,000 in 1910 to \$1,038,000,000 in 1919, with a total net income ranging from \$9,808,305 to \$27,186,124. A suit was impending in 1920 for violation of the Sherman Anti-Trust law, but an agreement was reached with the United States government whereby Armour and Company, as well as other big packers, should restrict their business to meat-packing alone and sell out their interests in public stockyards, public cold storage warehouses, etc.

ARMSBY, HENRY PRENTISS (1853-1921). American agricultural chemist born at Northbridge, Mass. (see VOL. II). Among his more recent activities may be noted his services as member of the Agricultural Committee of the National Research Council (1917) and as dele-

gate to the Inter-Allied Scientific Food Commission (1918). He is a recognized authority on animal nutrition. His later works include *The Nutrition of Farm Animals* (1917) and *Conservation of Food Energy* (1918).

ARMSTRONG, EDWARD COOKE (1871-). An American educator (see Vol. II). After heading the Romance Department at Johns Hopkins for seven years, he became professor of the French language at Princeton in 1917. During the War he served as national recruiting secretary for the Foyer du Soldat and as national director of French instruction in the training camps (1918). After the armistice of 1918 he lectured at the University of Bordeaux.

ARMSTRONG, HELEN MAITLAND (1869-). An American artist, born at Florence, Italy. She was the daughter of the United States Consul General in Italy. Her early education was at home; later as a pupil of Rhoda Holmes Nicholls, she studied at the Art Students' League. She also studied with Irving R. Wiles and William M. Chase. Her work includes the designing and painting of many stained glass windows, mosaics and mural decorations. She is a junior partner in the firm of Maitland, Armstrong and Company. Among her works are the windows of All Saints' Chapel, Biltmore, N. C., and windows in the Memorial Chapel of Mrs. O. H. P. Belmont, the armory of Mrs. Belmont's New York house, the New York Church of the Ascension and St. Michael's Church, and five in the chancel of the chapel at Sailors' Snug Harbor, Staten Island.

ARMY INTELLIGENCE TESTS. See **MENTAL MEASUREMENT; RACE PROBLEMS.**

ARNHEIM, FRITZ (1866-). A German historian and traveler, born in Berlin and educated at the Universities of Berlin and Halle. In the course of his studies he made prolonged tours through Sweden, Belgium, and Norway (1900-12), and subsequently lectured on these countries. He became editor of *Mitteilungen an der Historischen Literatur* (1915) and co-editor of *Schwedische Blätter* (1920). His numerous works on historical subjects, literature, etc., include *Der Hof Friedrichs des Grossen* (1912); *Schweden* (1917); and *Arteilung Skandinavischer Staaten in der Illustrierten Weltgeschichte* (1920).

ARNOLD, BION JOSEPH (1861-). An American electrical engineer (see Vol. II); During the years 1914-21 he reviewed plans for steam railway terminals for the city of Chicago and advised the officials of Boston, Des Moines, Omaha, Winnipeg, and many other cities of the United States in regard to traction matters. He was a member of the Naval Consulting Board during the War and commanded the Engineer Reserve Corps in 1917. He was transferred to the regular army in December, 1917, with the rank of lieutenant-colonel in the Aviation Section, Signal Corps. He made reports on the aluminium situation and controlled the development and production of aerial torpedoes. He was commanding major, then colonel, of the Aviation Section, Officers' Reserve Corps, in 1919.

ARNOLD, JULEAN (HERBERT) (1876-). An American commercial attaché for China. He was born in Sacramento, Cal. and educated

in the University of California. In 1902 he was commissioned by President Roosevelt student interpreter to China, and from 1904 to 1906 was vice and deputy consul general and mixed court assessor in Shanghai. He was vice and deputy consul in Foochow in 1906 and consul at Tammi, Formosa (1906-08), at Amoy, China (1908-12), at Chefoo, China (1912-14). He was consul general at Hankow from 1914 to 1915, becoming American commercial attaché for China in the latter year. He received various decorations from the Chinese government. An enthusiastic promoter of more extensive trade relations between the United States and China, he is the author of numerous magazine articles on China, and the compiler of the *Commercial Handbook of China*. In 1918 he was chairman of the American delegation to the China Tariff Revision Commission, as well as organizer and field representative of the American Red Cross in China.

ARNOLD, RALPH (1875-). An American geologist, born at Marshalltown, Iowa. He was graduated at Leland Stanford Junior University in 1899. Meanwhile he served as an assistant in geology until 1902, when he entered the service of the United States Geological Survey passing through the subordinate grades until 1908, when he became a consulting geologist. During these years he devoted his attention to the Tertiary palæontology and stratigraphy of the western coast of North America and thus acquired an intimate knowledge of the geology and palæontology of the California oil fields. In 1909 he retired from the survey to enter on the private practice of his profession as an oil expert; he became an accepted authority on the oil resources of the world. He gave courses of lectures on petroleum at Chicago (1914) and at Harvard and the Massachusetts Institute of Technology (1915). In 1914 he became an associate editor of *Economic Geology*. Dr. Arnold is the author of numerous papers, the more important of which have appeared as publications of the United States Geological Survey or as memoirs of the California Academy of Sciences.

ARNOUX, ALEXANDRE (1884-). A French novelist born at Digne (Basses-Alpes), France. He is the author of realistic stories and of a fantastic play. His style is alert, lively, dramatic. His works include *L'Allée des Morts*, poems (1906), *Au Grand Vent*, poems (1909), *La Mort de Pan*, drama (1909), *Le Roman Littéraire IV*, with D. Flaboché (1912), *Abisag ou l'Eglise Transportée par la Loi* (1918), *Indice 33*, awarded the Prix de la Renaissance (1922), *La Nuit de Saint-Barnabé*, describing Parisian urchins (1920), *La Légende du Roi Arthur et des Chevaliers de la Table Ronde*, a translation of Malory (1920), and *Huon de Bordeaux*, a fairy melodrama (1922).

ARRAS, BATTLE OF. See **WAR IN EUROPE, Western Front.**

ARRHENIUS, SVANTE (1859-). A Swedish chemist (see Vol. II). Among his later books are *Quantitative Laws in Biological Chemistry* (1915), *The Destinies of the Stars* (1918), and *Chemistry and Modern Life* (1919).

ARSONVAL, ARSENE D' (1851-). A French physician, physiologist and physicist. He was co-discoverer with Hertz, Tesla, and E. Thomson of high frequency electrical cir-

cuits and sole originator of their use in the treatment of disease. Every piece of apparatus for this purpose was separately invented by him, and the application of the method is known as arsonvalization. Born at La Borie (*Haute-Vienne*), he was educated in Limoges and received his medical degree from the University of Paris in 1877. He began his career as assistant in the laboratory of Claude Bernard and in 1882 was made director of the newly created laboratory of biological physics in the *Ecole des Hautes Etudes*. In 1889, he collaborated with Brown-Séquard in the pioneer research into the internal secretions. In 1894, he was appointed professor of medicine in the *Collège de France*. Beginning in 1881 and through the ensuing quarter century he published a continuous series of articles on electrophysiology in all of its aspects. His pioneer work on the action of high frequency circuits on man and animals was done during 1890-95. In 1903, assisted by Chauveau and others, he produced his magistral work *Traité de Physique Biologique*. D'Arsonval seems to have been singularly indifferent to publicity and priority claims, although when the diathermic circuit was introduced he is said to have shown that he had anticipated the discovery by many years. He became vice-president of l'Académie des Sciences in 1916, and its president in 1917.

ARTHUR, JULIA (1869-). An American actress, born at Hamilton, Ont (see Vol. II). On her return to the stage in 1914 after an absence of 14 years, Miss Arthur acted the rôle of the woman in *The Eternal Magdalene* at the Forty-eighth Street Theatre, New York. Other of her appearances were in *Liberty*

Aflame (1917), *Out There* (1918), as Mrs. Cheveley in *An Ideal Husband* (1918), and as Lady Macbeth in *Macbeth* (1921).

ARTILLERY. The dictum of the great Napoleon that artillery has been and always will be the determining factor of armies and peoples was abundantly confirmed by battle experience of the decade 1914-24. One of the outstanding lessons of the War was the increasing relative importance of artillery in modern warfare. The combatant troops of all the nations engaged in this greatest of all conflicts insistently demanded not only more artillery, but artillery of greater power and increased mobility. With entire populations of nations engaged in the struggle, scientific, engineering, and manufacturing knowledge was focused on the production of more and more powerful weapons to a degree never before experienced. The natural result of this condition of affairs is the great array of more powerful ordnance which owes its existence to the stimulus given inventive genius by the World War.

In addition to greater range and greater mobility, the modern artillerist demands greater rapidity of fire; greater permissible elevation, with a view to possible use against aircraft; all-around fire or the nearest practicable approach to it, in order to avoid constant shifting of the entire gun carriage; increased quickness of going into action and limbering up for quick

abandonment of untenable positions; and interchangeability of the gun with its companion howitzer of a slightly larger calibre on combination gun-howitzer mounts in order to simplify supply and maintenance problems in the field. Manifestly these conflicting requirements involve considerable compromise. The ingenuity of ordnance engineers has therefore been directed toward securing the most desirable combination of characteristics. To arrive at this result, practically all of the War Departments

of the nations involved in the conflict, as soon as the Armistice afforded proper opportunities, made a special effort to review the artillery situation not only in their own armies but in the armies of all nations involved in the War. In the United States Army this desire to benefit by the lessons of the strife just ended, led to the convening of a Board of Officers with instructions to make an exhaustive study of the entire artillery situation, and then to recommend the types and calibres of artillery which

COMPARISON OF ARTILLERY AMMUNITION VALUES

CIVIL WAR - WORLD WAR

should be developed for future armament. Similarly constituted Boards of Officers representing the armies of the Allied Powers made extended visits to the United States in the years immediately following the War, admittedly or presumably engaged in similar research. Few of the great nations of the world disclose the details of their ordnance designs, but under the present form of government and existing institutions of the United States, it would be quite impossible to keep secret information of this nature except in time of war. It is probable, however, that the information in regard to recent developments in artillery design published in the United States represents in the main a fair gauge of progress in similar directions in other countries, inasmuch as ordnance information was freely interchanged among the Allied Powers, and successful attempts were made to secure similar information from the authorities of the Central Powers after the Armistice. The following descriptions of artillery matériel may, therefore, be taken as typical of the state of the art of ordnance design and manufacture throughout the world.

Light Field (Division) Artillery. Prior to the War, weight was the determining factor in the design of division artillery. Motor traction had not arrived at a degree of dependability which would justify its employment in manœuvring artillery over varying terrain. The main reliance was still on animal transport, as it had been for the preceding century. Assuming that a horse could pull 650 pounds at all gaits and that a six-horse team was the maximum number that could be manœuvred effectively, 3900 pounds became the maximum weight for any complete single unit of division artillery. Within this limit the ordnance engineers of all countries strove to arrive at the best combination of range, striking velocity and explosive effect on burst. In the United States Army a division field gun 3 inches in calibre, firing a projectile weighing 15 pounds, was adopted as standard, and other countries varied only slightly from these figures. In order to achieve greater bursting effect a heavier projectile carrying a larger explosive charge was needed. Since the degree of mobility of the division gun must be maintained, it was found necessary to design a companion piece, the division howitzer, using a projectile approximately twice as heavy as that of the gun and attaining approximately the same range by providing for greater elevation of the howitzer

carriage than provided by the gun carriage, thereby avoiding the increased weight which would have resulted through strengthening the gun to fire the heavier projectile at low angles of elevation.

During the War, motor transport was developed to a high degree of dependability, and the maximum permissible weight of divisional artillery units was considerably increased. Accordingly, the Calibre Board of the United States Army laid down these requirements for ideal divisional artillery:

REQUIREMENTS OF THE CALIBRE BOARD FOR LIGHT FIELD (DIVISION) ARTILLERY

	Gun	Howitzer
Calibre	About 3 inches	105 millimeter
Weight of projectile	Not over 15,000 pounds	20 30 to 35 pounds
Maximum range	15,000 yards	12,000 yards
Carriage to permit elevation of	80°	65°
Traverse	360°	360°
Weight	Not over 4500 pounds	Not over 4500 pounds
Range with normal or reduced charge	11,000 yards	
Rate of fire, rounds per minute	20	
Carriage to be interchangeable for gun and howitzer		
Perfection of split-trail type recommended.		
Wheels to have rubber tires when motorized.		
Development of self-propelled mounts recommended.		
Simple firing mechanism, preferably of lanyard type, desired		
One type of breech block for both gun and howitzer.		
For normal use, a maximum speed of 12 miles per hour		

Division guns and howitzers which gave the required ranges within the prescribed limits of weight were designed and successfully fired, the increase in range over that of pre-War types having been attained principally by improvements in the contour of the projectile and by increasing muzzle velocities of the pieces. Increased velocities necessitated corresponding increases in length of the piece, for the division gun 131.7 inches in the new design as compared with 87.8 inches in the pre-War type. Increased length of the piece in turn made it necessary to support it as near the breech as possible in order to avoid the necessity of digging holes in the ground, to permit recoil of the gun when fired at high elevation. The consequent unbalancing of the gun requires the addition of an equilibrator system to maintain ease of manual elevation. Fortunately

1. EIGHT-INCH HOWITZER NO. 2, 1920, MARK 1, Mounted on an 8 inch Howitzer-155-millimeter Gun Carriage, 1920 E, Elevation 45 degrees
2. A 155-MILLIMETER GUN ON TRAILER MOUNT.
3. FOURTEEN-INCH GUN ON RAILWAY MOUNT.

the increased weight due to the equilibrator system and the increased length of bore is more than offset as far as mobility is concerned by the introduction of dependable motor transport in place of animal transport.

The requirement for a maximum elevation of 80 degrees was due to a desire to provide for possible use against aircraft and added nothing to the maximum range inasmuch as elevation in excess of 45 degrees tends to decrease range rather than to increase it. In order to provide for angles of elevation greater than 45 degrees it was necessary to increase the capacity and therefore the weight of the equilibrator system, to provide variable recoil with consequent increased complication and weight of the equilibrator system. While entirely practicable from an engineering and manufacturing standpoint, complication of design necessary to meet requirements which were outside of the ordinary functions of the piece led to a lowering of the maximum required elevation in the ideal mount from 80 degrees to 45 degrees, at which elevation practically maximum range is secured. Similar experiences led to the reduction in the requirements for maximum elevation of the howitzer from 65 degrees to 45 degrees. A traverse of 360 degrees as originally prescribed for the ideal division gun and division howitzer was likewise caused by a desire to provide a piece suitable for use against aircraft, but this requirement was abandoned in favor of two types of carriages, the split-trail, which permits considerable changes in azimuth without moving the gun carriage, and the box-trail, which permits only a limited change in the azimuth of 10 degrees but reduces complications of design and decreases weight and cost.

The requirement of a carriage to mount interchangeably, both the 75 millimeter gun and its companion piece, the 105 millimeter howitzer, was due to the feeling that it would expedite manufacture in the shops and simplify maintenance in the field. Strict adherence to this requirement, however, necessitated a combination carriage much heavier than either a specially designed gun carriage or howitzer carriage alone. Inasmuch as the howitzer mounted on the combination carriage required elevation mechanism of only 65 degrees, it did not fully utilize the weight of that part of the mechanism needed to provide the 15 degrees greater elevation for the gun. Further, as the howitzer imposed upon the carriage greater firing stresses than the gun, the combination carriage was of necessity made stronger and, therefore, heavier than was absolutely needed when mounting a gun. The need for all possible mobility not only en route but while being manned in action was found to outweigh the theoretical advantages which might be obtained by interchangeability of mounting, and it is entirely probable that in the future the division gun and the division howitzer will each have its specially designed carriage in order to keep the weight down to a minimum and thereby effect the greatest degree of mobility without decreasing power.

The increased application of motor transport to military problems permitted not only the hauling of greater loads at a speed equal to that of animal transport but greatly increased the speed at which these increased loads can be moved. These increased speeds in themselves affected artillery design by necessitating the

rubber-tiring of wheels and in many cases spring-supporting of loads, which had never been found necessary before. Here as elsewhere, no advantage is obtained without an off-setting disadvantage. The application of rubber tires to artillery wheels increases the total weight of the unit by several hundred pounds. Great progress was also made in the design and manufacture of self-propelled mounts for division artillery. Requirements of an ideal mount were set by the Calibre Board at a maximum speed of 12 miles per hour and a maximum weight not to exceed the capacity of a light pontoon bridge, or 9000 pounds. It is an interesting commentary on the rapid advances in automotive engineering that within three years of the establishment of this required maximum speed, a self-propelled mount for 75 millimeter guns or 105 millimeter howitzers actually attained a maximum speed of 30 miles per hour or two and a half times what was deemed possible of attainment when the Calibre Board established its requirements.

Medium Field (Corps) Artillery. These characteristics for ideal Corps artillery pieces were established by the Calibre Board:

MEDIUM FIELD (CORPS) ARTILLERY

	Gun	Howitzer
Calibre	Between 4.7 in. and 5 in.	About 155 mm.
Weight of projectile .	Not over 60 lb.	Not over 100 pounds
Maximum range	18,000 yd. super-charge	16,000 yd
Range, normal charge	12,000 yd.	Zones
Elevation	- 5 to + 80°	- 5 to + 65°
Traverse	360°	360°
Maximum rate of fire	6 rounds per minute	per 5 rounds per minute

Generalities:

- A split-trail carriage should be developed for howitzer interchangeable, if practicable, with that for gun.
- Maximum speed of 8 miles per hour.
- Wheels for carriage should be rubber-tired.
- Transport fully motorized, with wheel trailers for long rapid hauls.
- Weight limit, 12,000 pounds for wheeled vehicles, and 15,000 pounds for caterpillars.

The objections to unnecessarily high elevation and 360 degrees traverse as well as to the interchangeable requirement for the carriage proper are the same as discussed above for division artillery, but the disparity in stresses imposed upon the mount by the corps gun and corps howitzer is even greater than that of the division gun and the division howitzer. Since the carriage had to be designed to mount the howitzer successfully, it was possible to design a gun of even greater power than was at first held to be ideal, and still to adhere to the desired degree of mobility. Accordingly a gun firing a 50 pound projectile to a maximum of 20,500 yards has been found practicable. Self-propelled mounts for either the 4.7 gun or the 155 millimeter howitzer with a maximum speed of 15 miles per hour have been designed, manufactured and successfully tested.

Heavy Field (Army) Artillery. Of still larger calibres are the army artillery where ideal characteristics were formulated as follows:

	Gun	Howitzer
Calibre	About 155 mm.	About 8 inches
Weight of projectile . .	Not over 100 lb.	Not over 240 lb.
Maximum range	25,000 yd.	18,000 yd.

	Gun	Howitzer
Range, normal charge	18,000 yd.	Zones
Elevation	Zero to 65°	Zero to 65°
Traverse	360°	360°
Type of projectiles	H. E. Shell	H. E. Shell

Self-propelled caterpillar unit desirable for 155 mm gun

Certain proportion should be retained on rubber-tired wheel mounts.

It is desirable to develop a carriage which can be used interchangeably for 155 mm. gun and 8 in. howitzer

Maximum speed of S. P. caterpillar 6 m.p.h.; wheel mounts, 12 m.p.h.

Conventional caissons for this calibre are obsolete.

Transport All of this type should be motorized

Ammunition vehicles to correspond should be developed

Requirements of heavy field artillery as given above can be met except in regard to maximum elevation of 65 degrees and traverse of 360 degrees for the reasons previously discussed under division and corps artillery. Unlike the preceding classes, however, it is entirely practicable to design a carriage on which the 155 millimeter gun and 8 inch howitzer can be mounted interchangeably.

REQUIREMENTS FOR SUPER-GUNS

	Guns		Howitzers	
Calibre	8 or 10 in.	14 in.	12 in.	16 in.
Length in calibres	50	50	20	25
Weight of projectile	240-510	1,400	700	1,600
Maximum range	35,000	40,000	25,000	30,000
			18,000	
Elevation	0° to 50°	0° to 50°	25° to 60°	25° to 65°
Traverse	360°	360°	360°	360°
		15°	10°	
Type of projectile	H. E.	H. E.	H. E.	H. E.
Time for occupying position—		1 hour		
Prepared		1 hour		
Unprepared	1 to 4 hrs	8 hours	1 hour	
Maximum rate of fire	1 shot, 2 minutes			
Gauge of Track	Stand-ard, 60°	Stand-ard	Stand-ard	Stand-ard
cm.—24 in.	12-in			
Ammunition for all cannon:	Smokeless, flashless.			
Related zone charges for howitzers.				
Fuses:	Bore safe, instantaneous, and selective delay.			

Of the super-guns listed above, a 14 inch 50 calibre gun on a railroad mount has been designed, manufactured and successfully tested. The 16 inch 25 calibre howitzer has also been successfully fired from a barbette carriage. This howitzer can be used in combination with the railroad mount for the 14 inch 50 calibre gun

Coast Defense Artillery. The superiority of land fortifications over battleships where land guns have approximately the same range as those on the ships has always been accepted by artillery authorities. The failure of the joint British and French naval attacks on the Turkish coast defenses at the Dardanelles and the lack of success which attended the constant shelling of hastily erected German defenses on the Belgian coast, supplemented by bombing from the air, strengthened the contention that battleships cannot hope to attack with success coast fortifications provided with armament of approximately equal power. However, due to the increased elevation and the correspondingly greater range of guns mounted on battleships built since the War, artillery intended for coast defense purposes must of necessity be provided with carriages permitting elevation to develop the maximum range of the piece. In 1914 the American 14 inch 40 calibre gun

mounted on a disappearing carriage and the 12 inch long range mortar were typical of standard heavy coast defense armament. Through the development of airplane carriers to accompany attacking fleets, and the steeper angle of fall of projectiles fired at the 30 degrees to 40 degrees elevation now required for long range naval fire and provided in recent designs of battleships, the protection formerly given to guns mounted on disappearing carriages by extensive concrete emplacements was materially diminished. This consideration, together with the difficulty encountered in providing the required high angles of elevation on disappearing carriages, resulted in the adoption of the simpler barbette carriage for future installations. The best example of modern high-powered coast defense artillery is probably in the 16 inch 50 calibre gun mounted on a barbette carriage following designs of the United States Army Ordnance Department. This gun is of wire-wound construction, is approximately 70 feet in length over all, and with its recoil band weighs about 200 tons. It is equipped with a drop breech-block of the Smith-Asbury type, operated by compressed air. The normal charge for this gun consists of 850 pounds of smokeless powder, giving a maximum interior pressure of 38,000 pounds per square inch. With this charge a range of 50,000 yards is given an armor-piercing projectile weighing 2340 pounds and capable of penetrating 14 inches of battleship armor at all ranges. The barbette carriage on which this gun is mounted is simple and rugged in design; yet it has adequate provision for rapid and accurate manœuvring of the gun. The recoil of the gun is controlled by four recoil cylinders symmetrically located and integral with the cradle. The energy generated on discharge of the piece is dissipated by forcing oil through throttling grooves in the wall of each cylinder as the piston rods and heads securely fastened to the recoil band of the gun move to the rear with it. The piston rod pull amounts to 1,250,000 pounds for every 40 inches of recoil, so that the recoil cylinders dissipate 4,567,000 foot-pounds of energy each time the gun is fired. To insure the rate of fire of one round per minute, a power rammer is located on the racer near the breech of the gun. The powder charge and projectile are brought up to the carriage on special cars and rammed home by means of an electric motor actuating the rammer through hydraulic speed gears. The carriage is equipped so that all operations are normally performed by electric or mechanical power, but the mechanisms are so arranged as to permit manœuvring by hand power in emergencies.

German Long Range Guns. All military weapons are appraised, in general, on the basis of the amount of destruction they can cause. If the performance of the German long range guns used for the bombardment of Paris from Mar. 23 to Aug. 9, 1918, are judged on the usual basis, they must be set down as failures. The casualties caused by them averaged only about two and a half per round, notwithstanding that a thickly populated city was being bombarded. The property damage per round fired was approximately that of an ordinary 6 inch shell and in the aggregate was of negligible military value. However, these guns were not primarily weapons of destruction but were rather psychological weapons, for their purpose was served

when the German High Command was able to say without fear of contradiction that their troops were bombarding Paris by artillery fire. At first, no mention was made in their communiqués that super guns of much greater range than had ever before been even proposed for use in battle were responsible for the artillery bombardment.

The known fact that Paris was under fire of German artillery served two purposes. First, it greatly heartened the German civilian population as well as troops in the field with the knowledge that the ultimate goal had practically been reached. Secondly, it caused consternation among the civilian population of the Allies, who could not at first believe but that the Germans had succeeded in arriving at the gates of Paris. Before it was learned that the shells were coming from guns situated more than 75 miles from the city, a considerable exodus of Parisians to the South and West of France threw such a load on the railroad systems that a serious interference with the movement of supplies and troops was narrowly averted, but when the French technical experts had succeeded in reconstructing the projectile from fragments found at the point of burst and had deduced from their angle of fall the exterior ballistic characteristics which must have been used to produce the observed results, the situation was immediately relieved.

Although over 300 shells fell in the environs of Paris, none of them was known to have failed to explode. Exact information in regard to the ammunition remained unavailable. The guns themselves were withdrawn into Germany and broken up prior to the Armistice. Although the terms of this undertaking provided for delivering one of these pieces to the Allies, Germany never lived up to the agreement, and exact information as to the design of the gun and carriage still remains in the sole possession of the small group of Germans who conceived and successfully carried out this spectacular performance. As an artillery curiosity, this type of gun attained a range never before considered possible and also demonstrated that greater range could be attained at an angle of 50° elevation than the previously accepted 42° or 43°, provided that extremely high muzzle velocity was used and the projectile attained extremely high altitudes early enough in its flight to get full benefit from the more highly rarefied strata of air, instead of attempting to force the projectile against denser strata of air encountered at lower altitudes.

The following table gives the characteristics of the German Long Range Gun as computed by Maj. J. Matland Addison of the British Army and in a parallel column, the reconstructed characteristics as determined by the French General Staff.

	British	French
1. Range in miles	76	76
2. Maximum height in miles	28.9	23.7
3. Time of flight in seconds	177	177
4. Muzzle velocity, ft per second	5,000	5,620
5. Angle of elevation	50°	48°-39'
6. Velocity of Vertex, ft. per second	2,267	2,270
7. Velocity point of fall, ft. per second	2,626	2,380
8. Ballistic coefficient	10	8.78
9. Angle of fall	54-40	54-51
10. Weight of projectile in pounds	330	265
11. Calibre in inches	8.3	8.66
12. Weight of powder in pounds	400	441
13. Length in calibre	130	168

SUPP.—8

	British	French
14. Maximum pressure, lbs. per sq. in.	47,000	57,000
15. Volume of powder chamber in cu. in.	22,000	21,400
16. Volume of bore in cu. in.	70,700	88,500
17. The breech construction to be either of a number of powder chambers in the gun itself or a specially designed cartridge case to give successive or prolonged explosions of increment powder charges		

Bibliography. The most satisfactory source of information on modern artillery is the current issues of the magazine *Army Ordnance* published at Washington by the Army Ordnance Association. There are also various official pamphlets published by the War Department. Few if any authenticative treatises dealing with modern artillery were produced after the Great War. See EXPLOSIVES; ORDNANCE; TRENCH WARFARE; ARMIES AND ARMY ORGANIZATION; STRATEGY AND TACTICS.

ARTS AND LETTERS, AMERICAN ACADEMY OF. A society founded in 1904 by seven members of the National Institute of Arts and Letters in emulation of the French Academy. The membership is limited to fifty; vacancies are filled by election by the members from the National Institute on the basis of a lifetime achievement in literature, painting, sculpture, architecture, or music. Twice during the decade the gold medal of the Academy was awarded: to Dr. Charles W. Eliot, president emeritus of Harvard University, in 1915, and to Mrs. Schuyler Van Rensselaer, for distinction in literature. In 1921 the Academy received the gift of a four-story building at West 81st Street, New York, which it occupied to February, 1923. The Academy also received a gift of \$200,000 for the purpose of erecting a building at 633 West 155th Street, New York; the corner stone was laid by Marshal Foch in 1921 and the building was completed and opened in 1923. The centennial of the birth of James Russell Lowell was celebrated in 1919, and the tercentenary of the birth of Molière was commemorated in 1922.

The complete list of members in 1924 was as follows: John Singer Sargent, Daniel Chester French, James Ford Rhodes, William Milligan Sloane, Robert Underwood Johnson, George Washington Cable, Henry van Dyke, William Crary Brownell, Arthur Twining Hadley, Henry Cabot Lodge, Edwin Howland Blashfield, Thomas Hastings, Brander Matthews, George Edward Woodbury, George Whitefield Chadwick, George de Forest Brush, William Rutherford Mead, Bliss Perry, Abbott Lawrence Lowell, Nicholas Murray Butler, Paul Wayland Bartlett, Owen Wister, Herbert Adams, Augustus Thomas, Timothy Cole, Cass Gilbert, Robert Grant, Frederick MacMonnies, William Gillette, Paul Elmer More, Carl Melchers, Elihu Root, Brand Whitlock, Hamlin Garland, Paul Shorey, Charles Adams Platt, Archer Milton Huntington, Child Hassam, David Jayne Hill, Lorado Taft, Booth Tarkington, Charles Dana Gibson, Joseph Pennell, Stuart Pratt Sherman, John Charles Van Dyke. On the death of William Dean Howells, who had been president of the Academy since its foundation, William Milligan Sloane, formerly chancellor, became president, and was succeeded in the chancellorship by Brander Matthews, who resigned in 1924, and was in turn succeeded in the chancellorship by Nicholas Murray

Butler. Robert Underwood Johnson was secretary throughout the period.

ARTZYBASHEF, MIKHAIL PETROVICH (1878-1927). Russian novelist (see Vol. II). He produced little after 1914, but his earlier works were translated into English, and his reputation spread to Anglo-Saxon countries. *Savin* was translated in 1915, as was also *U polsednei chertiy* (*The Breaking Point*). *Voina* was put into English in 1918 as *War*. Other works brought before the English-reading public were *The Savage* and the plays, *Jealousy*, *Enemies*, and *The Law of the Savage* (1923).

ARZ VON STRAUSSBURG, ARTHUR BARON (1857-). An Austro-Hungarian general, born at Hermannstadt, Transylvania. At the beginning of the War he commanded the 15th Division on the Russian front, and later the command of the 8th Army Corps was given to him. Acting in conjunction with General Freiherr von Roth, he was successful in halting the Russian offensive. In 1915 he was associated with Mackensen in the vicinity of Przemyśl and later took Brest-Litovsk. In 1916 he commanded the 1st Army and defended Transylvania against the Rumanians. He was appointed to succeed Conrad von Hotzendorf as chief of the general staff of the Austro-Hungarian armies.

ASAKAWA, KWAN-ICHI (1873-). An American university professor and author of works on Japan. He was born at Nihonmatsu, Japan, and educated at the Fukushima Middle School, Waseda University (Tokyo, Japan), Dartmouth College, and Yale University. He was lecturer on the history and civilization of Eastern Asia at Dartmouth College in 1902; professor of English at Waseda University, 1906-7; and instructor in the history of Japanese civilization in Yale University, 1907-10. He became an assistant professor at Yale in 1910. He carried on special investigations in Japan, 1906-07 and 1917-19. He is author of many works on Japan of sound, dispassionate scholarship. These include *The Early Institutional Life of Japan* (1903); *The Russo-Japanese Conflict—Its Causes and Issues* (1904); *The Origin of Feudal Land-Tenure in Japan* (1914), and *Some Aspects of Japanese Feudal Institutions* (1918). His works also include contributions to the publications *Japan* edited by Capt. F. Brinkley (1904); the *History of Nations Series* (1907); *China and the Far East* (1910); *Japan and Japanese-American Relations* (1912); and *The Pacific Ocean in History* (1917).

ASCH, SMOLOM (1880-). A Yiddish playwright and popular producer of fiction who came to the United States at the age of 30 after establishing a reputation as a novelist and dramatist in Germany and Russia. In 1907 Max Reinhardt produced his *God of Vengeance* in Berlin. The beauty and poetry of Asch's early work in novel and sketch are due to a certain literary naïveté enabling him to express himself most completely. His plays are considered inferior to his other work. As a dramatist he takes great liberties with his forms, but as a craftsman he has the requisite elements of the art. His later dramatic pieces include *Die Familie Grossglück*, *Der Bund der Schwachen*, *The God of Vengeance*, *Jephthah's Tochter*, and *Shabbethai Zebi*. Other published works include *Uncle Moses*, *Motke the Vagabond*, and other stories of Jewish life. As an

artist Asch is rather to be classed with the modern Russian novelists and playwrights than with any of his Yiddish contemporaries.

ASCHAM, JOHN BAYNE (1873-). A Methodist Episcopal clergyman and author, born at Vanlue, Ohio, and educated at Ohio Wesleyan University, Harvard University, and Boston University, in Italy and Germany, and at the American School of Oriental Research in Jerusalem. He entered the ministry in 1897 and was ordained in 1899. He served in various churches in Ohio and was chaplain with the American army in France, at Allerey, 1918-19. He was special visitor from the American Waldensian Aid Society to the Waldensian Church of Italy in 1921, and in the same year he was delegate to the Fifth Ecumenical Methodist Episcopal Conference in London. Besides being a contributor to religious journals, he is author of *Help from the Hills* (Cincinnati, 1910); *A Syrian Pilgrimage* (New York, 1914); *The Religion of Israel* (New York, 1918); *The Religion of Judah* (New York, 1920), and *Apostles, Fathers, and Reformers* (New York, 1921).

ASCHE, OSCAR (1872-). An Australian actor, born at Geelong. He was educated at the Melbourne Grammar School and studied for the stage at Christiania, Norway. His first appearance was at the Opéra Comique. Subsequently he played Shakespearean repertory for eight years with F. R. Benson and joined Sir Herbert Tree's company in 1902. In the following year he acted with Ellen Terry in *The Vikings*. With Otho Stuart he managed the Adelphi Theatre in 1904; in 1907 took over the management of His Majesty's Theatre in London. Tours of Australia and South Africa followed. It was in 1916 that he appeared as Abu Hasan in his own play *Chu-Chin-Chow*, which reached its 2238th performance in July, 1921, thereby breaking all records of previous stage successes. With F. Norreys Connell he wrote *Count Hannibal* (1910); he is also the author of *The Spanish Main* (1915), *Chu-Chin-Chow* (1916), *Eastward Ho!* (1919), and *Mecca* (1920).

ASHANTI. A British protectorate in West Africa on the Gulf of Guinea, included in the Gold Coast Colony. It has an estimated area of 12,000 square miles, and in 1921, a population of 407,000, of whom 400 were Europeans. Though administratively Ashanti is an independent unit with a local judicial system in which the natives play an increasingly important part, economically it is to be considered a division of the Gold Coast. Railroad revenues and custom duties are all credited to the entire colony, with the result that the two territories cannot be disassociated (see **GOLD COAST**). Startling growth appeared in the native industry of cocoa-culture, the output increasing from 9000 tons in 1913 to 44,000 tons in 1921. The result was an increase in native prosperity and the appearance of private property. On the other hand, the gold output steadily dwindled, the 1921 yield having been 85,000 ounces (valued at £361,300), as compared with the 1911 yield of 124,900 ounces (valued at £530,800). The native population consistently remained tranquil; schools were spreading through the protectorate; about 400 miles of motor road were built; European imports increased. In short, Ashanti was an example of a native African state rapidly on the road toward Europeanization.

ASHFIELD, ALBERT HENRY (1874-). An English politician born at Derby. He was educated at technical schools in the United States, and after successful American experience in railway management, he returned to England to undertake important positions in the same field. In 1916 he was included in Lloyd George's government as president of the Board of Trade (1916-19), for business rather than political reasons. He was knighted in 1914.

ASHLEY, ROSCOE LEWIS (1872-). An American author of works on civics and history. He was born at Rochester, N. Y., and educated at the University of Rochester and Columbia University. He has been a member of the executive committee of the National Council of Teachers of Social Studies. His special interest has been the improvement of high school courses and texts. He has published *The American Federal State* (1902); *American Government*, for use in secondary schools (1910); *Ancient Civilization* (1915); *Early European Civilization* (1916); *Mediæval Civilization* (1916); *Modern European Civilization* (1918); *The Practice of Citizenship* (1922), and other works.

ASHMUN, MARGARET ELIZA (?-). An American writer of stories for girls and books for English study. She was born at Rural, Wis., and educated at the Stevens Point (Wis.) Normal School and the University of Wisconsin. After teaching in schools, she was instructor in English at her alma mater from 1907-12. Besides contributing to magazines, she is author of several English textbooks, and *Stephen's Last Chance* (1918); *Marion Frear's Summer* (1920); *Topless Towers* (1921); *Including Mother* (1922), and *Support* (1922).

ASHURST, HENRY F. (1875-). United States Senator from Arizona, born at Winemucca, Nev., and educated at the University of Michigan. He began the practice of law in 1897 at Williams, Ariz., and was admitted to practice before the Supreme Court of the United States in 1908. He was district attorney of Coconino County, Ariz., 1905-08. During these years he was active in politics. He was elected to the Legislature of Arizona in 1897, 1899, and 1903, and in 1899 was the youngest man who ever held the office of Speaker of such a body in the United States. In 1911 he was elected to the United States Senate on the Democratic ticket and was re-elected in 1917. He was active in the debates in the Senate, and was at many times member of important Senate committees.

ASIA MINOR. See **TURKEY**; **SMYRNA**; **ARMENIA**; **CILICIA**; and other divisions. See also **ARCHÆOLOGY**.

ASIR. See **ARABIA**.

ASKWITH, GEORGE RANKIN (1861-). An English lawyer and arbitrator in industrial disputes, born in Morley, Yorks., and educated at Marlborough and Brasenose College, Oxford. He was knighted in 1911 in recognition of the services he rendered his government. He was conciliator in many trade disputes, and in 1907 he was Assistant Secretary of the Board of Trade, in 1911 chairman of the Industrial Council and chairman of the Fair Wages Advisory Committee (1909-1919), president of the Middle Class Union (1921), and president of the

British Federation of Iron, Steel, and Triplate Merchants (1920-22). He was raised to the peerage in 1919.

ASPHALT. The production and manufacture of asphalt in the United States in the years 1914-24 involved native asphalt and related bitumens. Of these substances, 92,604 short tons valued at \$750,713 were produced in 1913, but this production had increased to 327,792 tons, valued at \$2,253,180, coming principally from Utah, Oklahoma, Texas, California, and Kentucky. In addition, considerable asphalt was manufactured in the United States from petroleum, both domestic and Mexican. With the growth and extension of the western oil fields an important industry was developed in recovering petroleum asphalt from crude petroleum oils of so-called asphalt-base obtained from California, Texas, and the mid-Continent fields of the United States, while crude oil from Mexico was also treated for this purpose at the various refineries. Three main processes were employed in the United States, steam refining, air refining, and a combination of steam and air refining. The largest amount was supplied by the use of the last process, which produced a ductile asphalt with highly cementatory qualities.

In 1913 the asphalt manufactured from domestic petroleum sold at the refineries, in the United States amounted to 436,586 short tons, valued at \$4,531,657. An important increase was effected by 1922, when the output was 805,145 short tons, valued at \$10,385,925. In the latter year California was the principal producer, with nine operators; Texas had three, and Illinois five. Fourteen American manufacturers were producing asphalt from petroleum of domestic origin exclusively, and 10 from petroleum of Mexican origin.

The imports of asphalt and bitumen which came into the United States free of duty in 1923 amounted to 129,138 tons, valued at \$1,070,906. In 1922 Barbados, Trinidad, and Tobago supplied the United States with 85,480 short tons valued at \$721,891, and Venezuela with 37,449 short tons valued at \$247,920, out of a total of 124,659 short tons valued at \$1,000,463. In 1922, 57,362 short tons of unmanufactured asphalt to a value of \$1,344,440 were exported, along with manufactured material worth \$1,261,125, including 58,845,352 square feet of roofing asphalt valued at \$870,200. This made a total value of asphalt manufactured and unmanufactured, exported from the United States, of \$2,605,565.

The asphalt and asphaltic materials manufactured in the United States from petroleum and sold at the refineries were used for paving, roofing, waterproofing, mineral rubber, road oil, and other purposes. In most of these fields demand had increased in the 10 years, and the corresponding industries had developed. See **PETROLEUM**; **ROADS AND PAVEMENTS**.

ASSOCIATION TESTS. A technique devised by the Swiss psychiatrist, Dr. C. G. Jung, for probing into a patient's neuroses. A list of words is read to the patient, who is asked to respond each time with the first word that comes to mind. By charting the time of response and by studying the patient's demeanor for any symptoms of emotion, the psychiatrist is able to get an insight into the type of ideas which worry him and by means of these to diagnose his condition. Dr. Jung also uses the

association test in preparation to the interpretation of a dream.

ASQUITH, HERBERT HENRY (1852-). A British statesman and former prime minister (see Vol II). The months following the outbreak of the War found Mr. Asquith, as premier, beset by many vexing problems. The question of conscription, the placing of the country's industries on a war footing, the turbulence of labor, and the series of unfortunate military expeditions, notably the Dardanelles campaign, on which the military command had embarked, embarrassed his ministry and aroused general discontent. In May, 1915, as a result of popular pressure, he was compelled to form a Coalition government, which included most of the prominent Unionist leaders and two Labor members. Mr. Asquith's hesitations and delays, however, estranged many of his colleagues, with the result that Winston Churchill, Sir John Simon, and Sir Edward Carson resigned from his cabinet in dissatisfaction. Meanwhile his position rapidly became insupportable as a result of the loss of Lord Kitchener, who had been one of the mainstays of his government, failure to terminate the War speedily, and his inability to tighten the lines of the German blockade. The end came with the sudden resignation (Dec. 5, 1916) from his cabinet of Lloyd George, who had become identified by the country with a programme of vigorous aggression. Mr. Asquith's resignation soon followed, and thus ended a premiership of nine years. Until the end of the War he supported the Coalition from the front opposition bench, but his decision to champion the Liberal principles once more met with a setback in his defeat in Lloyd George's khaki campaign of 1918. In 1920 he returned to Parliament as the result of a by-election. From then to 1922 he labored unceasingly in the interests of his party, but how little he had succeeded in restoring its prestige was shown by the election of November, 1922, when Labor moved up to second place and thus became the party of opposition. In 1918 Mr. Asquith published *Occasional Addresses*, a volume of his speeches, and *The Genesis of the War* in 1923.

ASQUITH, MARGOT (TENNANT) (1864-). English society was very much perturbed when Mrs. Asquith's *An Autobiography* appeared in 1920. By a few it was regarded as remarkable, while others refused to take her publication as anything but a bid for publicity through impertinent self-esteem. She is the wife of Herbert Asquith, former premier of England.

ASTOR, NANCY WITCHER LANGHORNE, VISCOUNTESS, (1879-). An American by birth and the first woman member of the British Imperial Parliament. She was the daughter of Chiswell Dabney Langhorne of Virginia and is the wife of Viscount William Waldorf Astor. When she won the election in Plymouth as Coalition Unionist candidate, it was not as a woman wholly ignorant of politics that she took her place in the House of Commons. She had always taken an active interest in her husband's former constituency. By her devotion to the welfare of English women and the younger generation, and her vivacious personality, the former Nancy Langhorne has received the admiration of her native and adopted country.

ASTRONOMY. The period 1914-24 witnessed rapid extensions of astronomical knowledge; new and powerful methods of investigation, leading to accomplishments formerly un-

dreamed of, opened up whole new fields of inquiry and provided data for the solution of many problems of astronomy which used to be regarded as hopelessly beyond the power of man to solve. One of the most significant features of contemporary astronomical research is its tightening connection with the sciences of physics and chemistry; scores of illustrations might be advanced to show how often the clue to fundamental physical and chemical problems may be found in the stars, and, conversely, how frequently advances in pure physics aid in the solution of astronomical problems. Close relations are now maintained at Pasadena, Cal., between the Mount Wilson Observatory, the Gates Chemical Laboratory, and the Norman Bridge Physical Laboratory, to the great mutual advantage of astronomy, physics, and chemistry.

The Solar System. Sun. The spectroheliograph, enabling photographs to be taken in the light of a single chemical element at any desired level in the solar atmosphere, has revealed many remarkable details of structure entirely lost in ordinary photographs, which confuse all levels and the light from all elements in one picture. Investigations with this instrument, by Hale and others, have demonstrated that sunspots are great whirling or vortical storms in the solar atmosphere. The motion of the vapors overlying the spots is radially outwards from the centre of the spot in the lower levels and inward in the higher levels; renewed visual investigation of spot structure is needed to harmonize this low level outflow with the visual appearance of inflow in the penumbra. The actual vortex appears to be deep-seated, beneath the photosphere, with its top near the reversing layer; the inflow from the chromosphere, which causes the vortices exhibited by the hydrogen flocculi, is a secondary effect produced in the high levels, where the direction of whirl may be independent of that of the spot vortex below.

Shortly after J. J. Thomson and others had shown that negatively and positively electrified particles must occur in great numbers in a hot gaseous body like the sun, Hale, by means of the Zeeman effect, found that a magnetic field existed in and about every sunspot. This field presumably is produced by the vortical whirling of charged material, preponderantly of one sign, although no Stark effect has been detected in the solar spectrum and it seems almost certain that no electric field exists in the spots. The strength of the magnetic field increases, up to a maximum of 3500 gauss, with the diameter of the spot. "Invisible sunspots" have actually been detected at Mount Wilson by searching for evidences of their Zeeman effect in promising regions, and this confirms the view that a spot represents a vortex which becomes visible only when cooling due to expansion is sufficiently great to produce a perceptible decrease in the brightness of the photosphere. The sun has been found to possess a general magnetic field also, the intensity of which diminishes rapidly with altitude above the photosphere; its maximum intensity is about 50 gauss.

Sixty per cent of the spots are definitely bipolar; they consist of two spots or groups of spots of opposite magnetic polarity, as if they represented the two ends of a single vortex filament; 30 per cent of the remainder show a tendency toward the bipolar type. Before the

sunspot minimum of 1912, the western member of each pair in the northern solar hemisphere was of South or negative polarity, the eastern member of North polarity, and vice versa in the southern hemisphere; these conditions were exactly reversed in the spots of the next cycle, the western members in the northern hemisphere being of North polarity; and another reversal, back to the conditions existing prior to 1912, took place at the minimum of 1923. Assuming, as seems probable, that the sign, as yet unknown, of the dominant charge is the same in all solar vortices, opposite polarities indicate opposite directions of whirl; and the reversal of polarities at minimum represents a periodic reversal of direction of whirl. The true period of solar changes is hence 22 years instead of 11.

Four belts are prolific in prominences, two of which coincide with the sunspot zones; and although the number of prominences is roughly proportional to the number of spots, O. J. Lee and Mr. and Mrs. Maunder have shown that there is rarely any direct association between the two phenomena, as was formerly thought to be the case. The corona continued to be a puzzle. Strong polarization, extending to more than a solar diameter from the limb at the eclipse of June 8, 1918, was found, indicating the presence of reflected sunlight. The usually prominent green line in the spectrum was hardly visible at the eclipse of Aug 21, 1914, while a previously unknown intense red line appeared. Many faint lines in the solar spectrum were identified with the lines composing the bands of various compounds.

Solar Radiation Studies. At the Astrophysical Observatory of the Smithsonian Institution, instruments and methods for measuring the intensity of solar radiation were constantly improved. Two additional stations were established, at Calama, Chile, and on Mt Harqua Hala, Ariz. The striking accord between individual observations taken simultaneously at different stations during a period of two years seems to show conclusively that the sun is a variable star, to a considerable per cent. The solar constant is low during years of solar quiescence and high during the years of sunspot activity; and in addition to this 11-year variation, it exhibits irregular fluctuations extending over periods of a few days or weeks.

It has been observed that when sunspots form or grow or are brought into view by the solar rotation, higher radiation values occur on the same day; but low values occur when spots transit across the central diameter of the solar disk, as if veiling coronal rays of diminished transparency extended out nearly radially from the spots. After taking into account this inequality of radiation in different directions, measurements of the variations in the brightness of Saturn show almost exact correlation with the fluctuations in the solar radiation.

Planets and Satellites. The radiation, exclusive of reflected sunlight, emitted by the planets, has been found to indicate large rises in temperature under the influence of solar radiation for the surfaces of Mars and the moon; Jupiter and Saturn have higher temperatures than could be maintained by solar radiation alone; the surface temperature of Mercury appears to be about the same as that of the moon, indicating a short period of rotation and a negligible atmosphere. Spectroscop-

ic studies of Venus have resulted in conclusive proof of the absence of both oxygen and water vapor above the visible cloud surface. Nearly 1000 minor planets have permanent numbers at the present time. It is now certain that no intra-Mercurial planets exist. A ninth satellite of Jupiter, moving in a retrograde direction in an orbit interlocked with that of the eighth satellite, was discovered by Nicholson at the Lick Observatory in 1914.

Comets and Meteors. No comets conspicuous to the naked eye put in their appearance between 1914 and 1924. The earth narrowly escaped a collision with Pons-Winnecke's comet in June, 1921. There is no evidence at present of any comet having entered the solar system from without; all appear to travel in genuine ellipses of extreme eccentricity. H. N. Russell has shown that the supposed cometary families of Saturn, Uranus, and Neptune have little or no foundation in fact; that of Jupiter, however, is genuine. Hoffmeister presented evidence tending to show that the majority of meteors are sporadic bodies that have entered the solar system from without and are traveling in strongly hyperbolic orbits.

The Sidereal Universe. Past researches on the fundamental problems of sidereal astronomy had to deal with data limited to a comparatively small number of stars; this is rapidly ceasing to be the case. The Harvard Observatory had completed the Henry Draper catalogue, which contains the positions, magnitudes, and spectral types of over 225,000 stars, covering the whole sky and extending in places to the tenth magnitude or below. Work on the Astrographic Catalogue, the Kapteyn Selected Areas, and other great projects was rapidly nearing completion in 1924. Through the use of photography, the determination of stellar magnitudes (photographic and photovisual), color indices, and trigonometric parallaxes was greatly accelerated; and the number of known proper motions and radial velocities was steadily increasing. Accurate measurements of the heat from the stars are now possible by the use of Coblentz's improved thermocouple; and Abbot, with a spectrolometric apparatus capable of detecting temperature differences of 1/100,000,000 degree, has determined the spectral energy distribution and effective temperatures of several of the brighter stars.

The most spectacular achievement was the measurement, at the Mount Wilson Observatory, of the angular diameters of several stars by means of an apparatus (devised by Michelson) consisting essentially of a 20-foot interferometer attached to the 100-inch reflector. On the night of Dec 13, 1920, Betelgeuse was found to have a disk 1/20 of a second of arc in diameter; the parallax is not known accurately, but the star cannot be less than 200,000,000 miles in diameter. Antares and Arcturus have been found to be 400,000,000 and 21,000,000 miles in diameter, respectively.

Physical Conditions in the Stars. Over 99 per cent of the stars fall into the spectral types B, A, F, G, K, and M on the Harvard Classification (corresponding to Types I-III of Secchi), which form a continuous and linear series; this is strong evidence that the principal differences in stellar spectra arise in the main from the variation of a single physical condition in the stellar atmospheres, and it is now generally agreed that this condition is temperature. If

we could gradually heat up a red star, the numerous metallic lines would fade out and the lines of helium, nitrogen, etc., would appear.

Saha, of the University of Calcutta, has shown that this would take place without any change whatever in the chemical composition of the stellar atmospheres, and he has thus cleared up some of the most puzzling problems of solar and stellar spectra. For example, the H and K lines of calcium, which are produced in the highest levels of the solar atmosphere far above the luminous region of sodium, magnesium and other lighter elements, are the enhanced lines due to a calcium atom which has lost one electron, the fundamental line of neutral calcium being that at wave length 4227; in the high levels of the chromosphere, where the ionization, which is only partial at the higher pressures of the lower levels, becomes complete, neutral calcium disappears, while the lines representing the ionized atoms remain conspicuous; but the lines corresponding to the ionized atoms of the other elements present fail to appear because they happen to lie in the extreme ultraviolet.

The percentage of ionized atoms depends upon temperature and pressure. As we pass from the cooler to the hotter stars we find the easily ionized atoms of the metals losing one electron. As the percentage of ionized atoms grows, the ordinary lines of the metals grow weak and vanish, while the spark lines appear and strengthen; at still higher temperatures the ionized atoms lose a second electron and pass into a state in which they give rise to practically no lines at all in the visible spectrum, while the lines of hydrogen and helium, difficult to excite at low temperatures, appear. The stellar spectra unfold to us in an unbroken sequence the physical phenomena which succeed each other as the temperature varies from 3000° to perhaps 30,000°C.

The spectral lines are produced in the outermost, highly rarefied regions of stellar atmospheres. It is now possible to find the order of magnitude of the pressures existing in the solar and stellar reversing layers; St. John, Fowler and Milne find it to be negligibly small—perhaps that of the gas in the vacuum arc—contrary to what was formerly supposed. The surface temperatures are also computable and run from about 16,000°C. for spectral type B2 to 3900°C. for K5. Deep in the interiors of the stars the temperatures probably run to millions of degrees.

The *absolute magnitude* of a star is defined as the magnitude it would have if at a distance corresponding to a parallax of 0.1 seconds of arc. Obviously, the *apparent* magnitude depends jointly on the absolute magnitude and the real distance of the star, and the absolute magnitude in turn is determined by the intrinsic luminosity per unit surface area and the size of the star. It is to be expected that stars having the same type of spectrum, and hence the same temperature, will have the same surface brightness; if they differ in absolute magnitude, it will be by virtue of a difference in size. The differences in the sizes of the stars are mainly due to differences in density; for in striking contrast to the enormous range of observed stellar luminosities, corresponding to a light ratio of over 100,000,000 to one, stands the comparative uniformity of stellar masses, as the

study of the binary systems has shown. With very few exceptions, the masses of the stars lie between $\frac{1}{2}$ and 15 times that of the sun, the majority of them between $\frac{1}{2}$ and two times the sun's mass. It is found that stars of the same spectral type, but differing in absolute magnitude, exhibit slight differences in the character and intensity of those spectral lines that are peculiarly sensitive to the physical conditions under which they are produced; these variations in the lines are brought about by the differences in density and depth of the stellar atmospheres. By a study of the spectra of stars of known parallax, curves may be drawn connecting the differential intensities of selected lines with absolute magnitude, by spectral types, and then applied empirically to deduce the absolute magnitudes; and hence the parallaxes, since the apparent magnitudes can be measured, of other stars. This method, worked out by Adams and Kohlschutter, has been extended to practically all spectral types; and completely independent determinations of spectroscopic parallaxes at Mount Wilson and at Victoria are in good agreement except for the late type K stars. The most far reaching result of the study of the data provided by these new methods of sounding interstellar space has been the discovery of the existence of two great classes of stars to which the names giant and dwarf have been applied.

If absolute magnitudes, obtained by whatever method, be plotted against spectral type, the stars show a well marked division into two distinct groups. One group consists of stars of great intrinsic luminosity, varying little in absolute magnitude from type to type; the other consists of stars whose brightness falls off rapidly with increasing redness. The two groups are distinctly separated in types K and M, all K and M stars being either very faint or very bright, none intermediate, but are partially intermingled in type F and thoroughly so in type A, all B and A stars being very bright. On the basis of these and many other facts, Russell and Hertzsprung independently put forth the giant and dwarf hypothesis about 1914, although somewhat similar views had been maintained for some time by Lockyer, the evidence favorable to which is now overwhelming. A mass of hot gas, isolated in space, radiates heat and consequently contracts; Homer Lane in 1870 showed that so long as the density is low enough for the ordinary gas laws to be obeyed approximately, the temperature of the mass must rise with contraction, beginning to fall only when the density begins to approach that of a liquid. Hence, starting as an immensely inflated tenuous gaseous mass, of density perhaps $1/100,000$ that of our sun, a star condenses, its temperature rises, and its original reddish color changes through yellow to white; the first of the above groups of stars, the giants, comprises the stars in this ascending stage of evolution; their absolute magnitudes depend but little on spectral type, because their rising temperatures compensate for the decreasing surface areas. Finally a critical point is reached, at a density of one or two tenths that of our sun, the temperature begins to fall, and the color goes through yellow to deepening shades of red as the star approaches final extinction; the second of the above groups, the dwarfs, comprises the stars on this descending branch; here the decreasing temperature and

diminishing surface area cause a rapid fall in brightness with advancing type.

During the life history of a star, any given temperature is passed through twice; the maximum temperature is associated with middle age. It depends on mass, how far up in the spectral series a star gets on the ascending stage; it is well known that on the average the hot stars are more massive than the cool ones; a star of small mass is a poor self-heating affair. At maximum, the surface temperature of a star may be anything up to about 25,000°C. The average space-velocities of the stars increase continuously from type B to type M; in addition, there is a progressive dependence of velocity on absolute magnitude, the faintest stars having the greatest average speed.

The energy radiated by the stars is brought to their surfaces, not by convective transfer of matter, as was formerly supposed, but as first pointed out by Sampson, mainly by radiation and absorption within the star. At any point within, the gases settle down to the temperature at which they radiate an amount of energy equal to that which they absorb from the radiation flowing through from below; radiation pressure plays a fundamental part in the dynamic equilibrium of the stars. A complete theory of the radiative equilibrium of giant stars has been developed by Schwarzschild and Eddington. At each point there is equilibrium between the gravitational compressive force due to the weight above, and the expansive forces of gas pressure and of outward radiation pressure.

A typical giant star is a mass of gas with average density about that of our atmosphere, swollen to at least 1000 times the bulk of the sun. The energy of atomic motion constitutes a great store of heat, but not the principal part of the star's total energy. The ether inside the star is full of radiation waves hastening in all directions; these waves are encased in the material, which prevents them from leaking into outer space except at a slow rate. An ether wave may thread the maze for hundreds of years before finding its way out at the surface. Of course, all hot bodies possess this double store of material heat and ethereal heat, but in all bodies with which we are directly familiar the ethereal portion is a most insignificant part of the whole—only in the giant stars does it rise to importance.

This intense ethereal energy inside the star exerts a strong pressure, distending the star, and bearing to some extent the weight of the overlying layers. For a star of mass half that of the sun, it may be shown that 0.044 of the weight is supported by radiation pressure; for one of mass five, 0.457 of the weight is so supported. Shortly beyond this point, practically all the weight is thus supported, so that larger masses will in this way be rendered unstable. All over the universe we find that the actual stellar masses do not in general exceed those at which radiation pressure begins to play the dominant part. The theoretical diameters of the giant stars may be computed, and the values found are in good agreement with those that have been measured. This provides a final proof of the giant and dwarf theory, for it is inconceivable in the light of present known facts that the vast bulks of the giants can be due to anything other than the diffuseness of the matter composing them.

A star must have some source of energy other than that coming from contraction in order to keep up its vast stores of material and ethereal energy and to maintain its radiation. Delta Cephei would have to increase in period by 1 per cent in 40 years if its radiated energy came solely from contraction, whereas in reality the decrease is only 0.08 second per year; geologic evidence requires some source of energy other than contraction for solar radiation, likewise. In all probability this source is the release of sub-atomic energy when the complex chemical elements are built up from the simpler ones under the extreme conditions of pressure and temperature existing within the stars; modern physics shows that in such a process 0.8 per cent of the mass disappears, probably to reappear as vast amounts of ethereal energy.

Variable Stars. Among the brightest and most massive of stars are the Cepheid variables, most of which are of spectral types F and G. The type, and presumably, therefore, the surface temperature, changes during the variation, the change in brightness being due to the periodic heating and cooling. The most plausible explanation of Cepheid variation is the pulsation hypothesis of Shapley, which postulates a regular dilation and contraction of the star. The semi-amplitude of the oscillations necessitated by observed spectroscopic radial velocities in Cepheids is from 4 to 14 per cent of the radii.

A remarkable relation between absolute magnitude and period has been found for the Cepheids by Miss Leavitt. The globular clusters and the Magellanic Clouds contain many Cepheid variables, and this relation affords a means of determining their distances; the validity of the results is supported by so much corroborative evidence that the reliability of the method seems clearly established.

Nova Aquilæ III, discovered during the total solar eclipse of June 8, 1918, was the most brilliant nova since Kepler's Star of 1604; normally an irregular variable of the tenth or eleventh magnitude, it attained a brightness of -0.5 magnitude on June 9. Nova Cygni III, normally a faint star below the fifteenth magnitude, rose to magnitude 3.5 on Aug. 20, 1920. So far as can be ascertained, novæ are dwarfs before the outbreak; no satisfactory theory of the outburst has yet been proposed, but it must be essentially a mere surface phenomenon.

Nebulæ. The nebulæ may be divided into *planetary* nebulæ, whose true character is still largely enigmatical, although their spectra indicate them to be composed of luminous gases; *diffuse*, or irregular, nebulæ, practically confined to the Milky Way and Magellanic Clouds, and lying in general at moderate distances; and *regularly-shaped* nebulæ, which appear of all forms from circles or spheroids, through moderate ellipses and greatly flattened ellipses drawn out at the ends of their major axes, sometimes almost to sharp points, to the various forms of spirals. The irregular nebulæ are always associated with stars, usually with the very hottest stars. It was formerly supposed that these stars had just been born, and were immediate products of condensation of the nebulæ; but we have now learned that these hot stars are in reality at the middle of their life. About half the diffuse nebulæ show a gaseous spectrum; the remainder show a continuous spectrum crossed by dark lines, as if they were

opaque and reflected the light of the neighboring stars.

Whenever the spectra of both nebula and associated stars can be obtained, they are found to be identical; furthermore, if the stars are of the hottest types, the nebula shows a gaseous spectrum, but if the stars are of a cooler type a continuous spectrum with dark lines is exhibited by the nebula. Quantitative luminosity measurements by Hubble have solved the outstanding problem of the source of nebular luminosity by showing that the nebulae derive their light from the associated stars. A gaseous nebula is stimulated in some way and set shining by the stellar radiations, while an opaque one reflects the light of the stars.

There are many large tracts of obscuring matter in some regions, particularly in the Milky Way—great dark nebulae, clouds of exceedingly minute dust particles—which cut off the stars behind; probably no hard and fast division exists between dark or faintly luminous nebulae and bright irregular gaseous nebulae; in fact, in some cases we can trace one grading into the other. It appears that only stars at the very highest temperatures are capable of lighting up surrounding nebulosity, which would otherwise remain invisible or else appear as a dark marking on the sky.

For a time the spirals were generally looked on as external galaxies, island universes, perhaps millions of light-years distant; in recent years, however, the trend of evidence is distinctly against this hypothesis, and toward a true nebulous character and more moderate distances for these objects. The spirals have extraordinarily great radial velocities, in general recessive. By comparing photographs taken at intervals of several years, van Maanen and others have detected internal motions in the arms, consisting of motion outward combined with a rotation of the whole nebula in periods of from 50,000 to 200,000 years; Jeans, however, has found it impossible to account for the observed motions on any hypothesis of matter moving under the law of gravitation. The spirals are often hundreds of light-years in diameter, but are much smaller than galaxies; and M33 appears to be only about 6000 light-years distant. The density of the nuclei is incredibly small, perhaps less than that of the gas in the best vacuum obtainable in the laboratory.

The curious phenomenon of stationary calcium lines in the spectra of many spectroscopic binaries has revealed the existence in interstellar space of great absorbing clouds of quiescent calcium vapor, at rest relatively to the stars. Miss Heger has recently discovered that the sodium D lines in Delta Orionis also are fixed in position.

Structure of the Universe. The exceptional progress made in recent years in the accumulation of extensive and accurate statistical data concerning the objects composing the sidereal universe has rendered necessary considerable revision of older views on the size and arrangement of the galactic system. We live in a finite universe, containing perhaps some 1,500,000,000 suns altogether, in which, it has been shown, the stars thin out quite perceptibly within distances reached by telescopes of moderate size. It is generally agreed that the stellar universe as we know it, or galactic system, is a disk-shaped organization of stars,

of planetary, diffuse, and dark nebulae, and of loosely-organized open star clusters of great variety; all these objects concentrate, as we see them, along the region of the Milky Way, which is almost entirely a mere depth effect. The globular clusters, though not in the Milky Way, are also affiliated with the galactic system; while the spiral nebulae, which emphatically avoid the Milky Way, are outside the most populous regions of space.

After the vast gap beyond the confines of the solar system, we come first to our nearest stellar neighbor, Proxima Centauri, discovered in 1916 by Innes, at a distance of 24 million million miles, then to Alpha Centauri at 25 million million miles, Munich 15,040 at 36 million million, Lalande 21,185 at about 47 million million, and Sirius at 50 million million. Within 100 light-years of the sun the stars appear to be scattered with fair uniformity in space, to the number of about 6200. Beyond lies a steady succession of stars, mostly fainter than the sun, nebulae, clusters, and starclouds, until finally we reach the globular cluster N. G. C. 7006, which Shapley finds to be 200,000 light-years distant and hundreds of light-years in diameter. To all appearances, the star cloud N. G. C. 6822 is still more remote, outside the bounds of our stellar system entirely. According to Shapley, its distance is about six million million million miles, a distance which light occupies one million years in traversing.

There still exists some difference of opinion as to the distances of the more remote clusters and star-clouds, as to scale of the total galactic system. One of the great outstanding researches of the decade, an extensive study of known globular clusters carried out by Shapley with the aid of the period-luminosity relation for the Cepheids, the characteristics of the B-type stars, etc., from which the distribution of the clusters in space has been determined, has shown that a third of the known clusters are more than 100,000 light-years distant, and that the star-clouds of the galaxy extend at least as far as the furthest clusters. Shapley concludes that the diameter of the universe is at least 300,000 light-years. In the older views, of which H. D. Curtis, Schouten, and others were still adherents in 1924, the diameter of the universe is under 30,000 light-years. Quantitatively, Shapley's results are admittedly approximate, but to reduce them tenfold would be to work havoc with a vast and beautifully concordant body of modern astronomical fact and theory which was not available when the former views were originated.

In the system outlined by the globular clusters as determined by Shapley, the galactic plane is still a plane of symmetry and flattening, though the clusters extend to great distances both above and below this plane, to eight kiloparsecs on the average, the parsec being a distance, 3.26 light-years, corresponding to a parallax of 1 second of an arc. The system is elongated in plan, and the sun is near one end of it, so that practically all the clusters are in one hemisphere; the dense starclouds, numerous novae, etc., in the direction of Sagittarius, indicating a much greater depth for the system in that direction, confirm this conclusion. The sun is fairly centrally placed in a local subordinate star-cloud (about 90 parsecs from the centre, according to Charlier) of about 1000 parsecs diameter, imbedded in

and moving through the general star fields of the Milky Way, but this cloud is 50,000 light-years from the galactic centre. Stars of type B down to the sixth apparent magnitude are almost exclusively members of the local cloud. The central plane of the local cloud, which may be detected in the distribution of stars over the sky, is not coincident with the galactic plane by 10 to 15 degrees. The local cloud may possess an absorbing medium, but if so it must fall off rapidly beyond, for the existence of color indices (photographic minus photo-visual magnitudes) from -0.5 to 1.9 in cluster stars just as in the nearer stars shows that the general absorption of light in space is negligible.

Only very uncertain and tentative theories can be formulated regarding the exact space distribution and motions of the stars. Kapteyn's attempts along this line are the best known. Mathematical researches on the dynamics of the stellar system, largely along the lines of statistical mechanics, seem to indicate that the universe is not in a steady state, has not yet reached equilibrium, and is probably collapsing toward some more permanent form.

The motions of the stars are quite complex. Strömberg finds that Kapteyn's first stream among the type A stars may be identified with the Taurus group, and his second with the Ursa Major group; the remaining stars belong to a central group of small systematic motion, the $\frac{1}{2}$ group of Halm, and with which the type B stars probably are associated. The giants of type F to M form a single group with a small systematic motion relative to the commonly adopted origin and an ellipsoidal velocity distribution, the ellipticity diminishing with spectral type to very small values for late K and M stars; the dwarfs also form a distinct group with regard to their motions.

Celestial Mechanics. E. W. Brown's Lunar Theory, developed according to the methods of G. W. Hill, was completed by the publication of the lunar tables in 1920. No terms of appreciable significance have been omitted, yet the moon still deviates unmistakably from its predicted position. The *irregular* deviations are at least partly due to irregular variations in the rate of rotation of the earth. The *secular acceleration* is undoubtedly due to the effects of tidal friction, which causes a direct acceleration of the moon's orbital motion, as well as a spurious acceleration due to increase in the length of the day; the researches of Fotheringham have shown that the solar and lunar accelerations can be accounted for by a slowing down of the rate of rotation of the earth by $1/800$ second per century, and Jeffreys and Taylor have shown that tidal friction in shallow seas is fully capable of doing this. Finally, there is a *long period term* in the mean longitude of the moon the cause of which is unknown.

Important investigations relating to the registration and prediction of tides, the dynamic theory of tides and tidal currents, and the meteorological effects on tides, were carried out by Proudman and Doodson at the Tidal Institute of the University of Liverpool, founded in 1919. One of their most successful efforts resulted in the construction of a more accurate map of the co-tidal lines in the North Sea and the Irish Sea; Sterneck's map of the co-tidal

lines of the North Sea (1920) was thus shown to be much closer to the facts than the previous map of R. A. Harris.

Theory of Relativity. In the realms to which modern experimental physics has introduced us, phenomena transcending all the previous experience of man are encountered; and many of our scientific theories, which, being merely logical structures resting ultimately on axioms drawn from past experience, must always be regarded from an essentially pragmatic point of view, prove, as might have been expected *a priori*, incapable of subsuming under themselves the sequences of phenomena here perceived as taking place. New conceptual schemes for the representation of the phenomena of the physical universe perceived to date must be constructed; and one of these, Einstein's Generalized Theory of Relativity, is of particular interest to astronomers because it substitutes for Newton's Law of Gravitation another law, and since the three crucial tests of the theory are all of an astronomical character.

In the face of strong opposition, much of it of an untenable nature, however, the Theory of Relativity gradually compelled wider and wider recognition and acceptance solely by its merit. The continued agreement of this theory and its predictions with facts has been of such a nature that a logical and impartial consideration of the evidence available and its character as a whole indicates a probability of the ultimate complete vindication of Einstein's views. In any event, the new and powerful methodology and point of view of the theory, the peculiar nature of which has unfortunately been the cause of much misconception concerning relativity, are permanent acquisitions of inestimable value, regardless of how the form of the theory itself may have to be modified in order to accord with fact.

Einstein's law of gravitation, besides explaining all that Newton's law explains, accounts for the most conspicuous of the exceedingly few instances in which Newton's law has failed, viz, the anomalous motion of the perihelion of Mercury; every other explanation so far suggested has been shown to be untenable. The theory of relativity also predicts that a ray of light passing close by a massive body should be bent from a straight line; photographs of the stars around the sun taken at the time of a total eclipse should show these stars in slightly different positions from those they normally occupy. The observations of the British expeditions during the eclipse of May 29, 1919, and of the Lick Observatory expedition during the eclipse of Sept. 20, 1922, have proved beyond reasonable doubt that a deflection of the amount called for by Einstein's theory actually exists; here again, all alternative explanations have been found inadequate. The theory of relativity also calls for a slight shift, toward the red, of the lines in the solar spectrum; this is the most difficult prediction to test, because such a multitude of factors influence the positions of the spectral lines. Different investigators arrived at contradictory results for some time, but finally, after an extremely thorough and extensive investigation at Mount Wilson, St. John obtained observational results according in general with those obtained earlier by Evershed and somewhat later by H. D. Curtis. St. John and Evershed conclude that the results show that after all other effects

have been allowed for, differences remain between solar and laboratory wave length of the order called for by the Einstein theory. Curtis does not accept this interpretation of the facts.

Cosmogony. Apart from the comparatively small number of planetary nebulae, Cepheid variables, long-period variables such as Mira Ceti, and a few other objects, the nature and interpretation of which are still enigmatic, all known celestial bodies can be arranged in one single continuous sequence, which is approximately a sequence of increasing density, beginning with nebulae of incredible tenuity and ending with solid stars as dense as iron. There can be but little doubt that this sequence is evolutionary, for as a body radiates heat its density increases until it can increase no more.

In the difficult field of modern cosmogony, where mathematics, physics, astronomy, and geology dispute the sovereignty, the masterly researches of J. H. Jeans stand out preëminently. At some stage in the history of a star it must be completely gaseous, for only by the effect of radiation pressure in a gaseous mass can we explain why 90 per cent of the stellar masses lie between a half and five times the mass of the sun. Jeans has shown that the nebular hypothesis, with some modifications and reservations, may be made to explain nearly everything except our solar system, which it was specifically invented to explain. The heavens have indeed been searched in vain for objects showing the rings required by the Laplace-Roche theory of the evolution of a rotating incompressible fluid mass; but numerous nebulae show the flattened and lenticular forms indicated for the early stages by this theory; others show lenticular centres with definite indications of detached matter around an equatorial sharp edge, but this detached matter is in the form of spiral arms.

Spectroscopic examination of the regular nebulae shows in every case a rotation with a high velocity about an axis which appears in the sky as the shortest diameter of the nebula. Now Jeans has proved that the classic "figures of equilibrium" will not be materially different for even highly compressible gases in the case of slow rotation; but as the rate of rotation increases through shrinkage, a compressible mass will finally, if the central density exceeds three times the mean density, take on the shape of a bi-convex lens, with a sharp equatorial edge. Further adjustment of equilibrium to increasing rate of rotation is no longer possible by mere change of shape; additional shrinkage involves an actual break-up of the nebula, the excess of the angular momentum beyond that which can be carried by the shrunken mass being thrown off into space by the ejection of matter from the equatorial sharp edge.

Since the nebula is not alone in the universe, the equatorial edge will be deformed from a perfectly circular shape through the attraction of other bodies, and this deformation, however slight, will cause the ejected gas to stream out from two antipodal points on the equator, into spiral arms. This causes the dark equatorial band observed in nebulae which are viewed edge on. The ejected matter comes in time to dwarf the central nucleus in size, until finally there is little nucleus left.

The gigantic scale on which ejection, takes

place is such that gravitative attraction overcomes the expansive influence of gas pressure and is able to hold the jet together as a compact stream; the issuing filament will break up into separate aggregations, which give rise to the lumpy appearance of the arms of spirals. Dynamic theory enables us to calculate the size, mass, and distance apart of these aggregations; a comparison between their distance apart, as calculated in kilometers, and their angular distances apart as we observe them in actual nebulae, leads to the distance of these nebulae, and the resulting estimates of nebular distances are in good agreement with those obtained in other ways; furthermore, in every nebula for which the calculation can be made, the calculated mass of a single condensation proves approximately equal to the mass of the average star.

In many nebulae, the observed knots in the arms take the form of pronounced condensations, and in the outer regions of some nebulae these condensations have further developed into detached and almost star-like points of light. The family of stars thus born out of a single nebula may be millions in number; they may either mingle with the general mass of the stars, giving rise to a cluster such as the Great Bear group, or, if the original nebula was sufficiently remote from the main universe, they may form a separate colony, such as the Hercules cluster. These alternatives perhaps represent the two extremes of a continuous chain of possibilities. Quite possibly the main mass of the stars may be a collection of clusters, each originated out of a single nebula, now so intermingled that it is difficult to detect the separate groups. Kapteyn's two star streams may be two intermingled moving clusters; the third stream of B and C stars found by Eddington and Halm, which Charlier has found to have the shape of a round biscuit lying parallel to the Milky Way with its diameter 2.8 times its thickness, has just about the shape and position that dynamic theory shows any cluster of stars of common origin ought to have after having been knocked about *ad infinitum* in our universe of stars.

The above evolutionary process is essentially, at least in its early stages, that imagined by Laplace, except that it is on an incomparably grander scale. Each of the condensations, however, as it starts off into space, is a gaseous nebula about the size and mass postulated by Laplace; but dynamic theory proves that on account of the difference in scale, matter ejected from such a nebula could not condense into filaments, still less into detached masses, but would merely constitute a diffuse atmosphere about the parent mass. As the latter shrunk by radiation, the constancy of angular momentum would, until it had shrunk to a certain critical density, merely demand that more and more gas should be transferred to this atmosphere. A cataclysmic period would then ensue, from which the mass would emerge as a binary star with the two components almost in contact. As development went on, the two components would move apart, the orbits become more eccentric, the components themselves might repeat the process of fission, and so on. The distance which any particular system goes along this course would depend in effect on the amount of rotation with which it was originally endowed. Both theory and observation agree that not many systems stay out the whole course; prob-

ably only half the stars in the sky are binaries, and only a tenth this number are multiple systems.

Nowhere in this scheme is there a place for anything in the least degree resembling our solar system. However, it is to be expected that off the normal course of evolution would exist branch lines to which a few systems would be turned by some exceptional circumstance, such, for instance, as the close approach of two stars. It seems that the solar system must be added to those classes of objects which do not appear to fit in with any normal evolutionary scheme; our sun may be the only star attended by planets, our earth the only body in the universe capable of supporting life. A stellar collision, or an approach close enough for tidal disruption to take place, is an exceedingly improbable event; but it may have happened that our system had a tidal origin. At least, such an encounter would give rise, as Jeans has shown, to a system strikingly resembling ours in many ways.

Miscellaneous. The 100-inch Hooker reflector was put into regular operation at Mount Wilson in 1919; the Dominion Observatory at Victoria, B. C. with a 72-inch reflector, was opened in 1918.

Turkey adopted the Gregorian calendar in 1916; Russia in 1918, Greece and all adherents of the Eastern Orthodox Churches in 1923. The Julian Calendar is now followed only by the Ruthenian Catholics or Uniates of the Russian Ukraine. The question of the reform of the present calendar was much agitated, but nothing definite was done.

International scientific organizations were all badly disrupted by the War. To carry on international cooperation in scientific work, the International Research Council was organized after the War. The International Astronomical Union, a division of the Council, was organized at Brussels in July, 1919, and held a meeting at Rome in 1922.

Necrology. The following eminent astronomers died during the decade: Sir Norman Lockyer, Aug. 16, 1920; Percival Lowell, Nov. 12, 1916; Karl Schwarzschild, May 11, 1916; E. C. Pickering, Feb. 3, 1919; S. W. Burnham, Mar. 11, 1921; J. C. Kapteyn, June 18, 1922; E. E. Barnard, Feb. 7, 1923.

Bibliography. Of books published in this period, the following are of unusual significance in different departments of astronomy: H. S. Jones, *General Astronomy* (London, 1922); Newcomb-Engleman, *Populare Astronomie*, 6th ed. (Leipzig, 1921); T. E. R. Phillips, ed., *Hutchinson's Splendor of the Heavens* (London, 1923); R. G. Aitken, *The Binary Stars*, (New York, 1918); K. Schiller, *Einführung in das Studium der Veränderlichen Sterne* (Leipzig, 1923); J. Bosler, *L'Évolution des Étoiles* (Paris, 1923); H. C. Plummer, *Introductory Treatise on Dynamical Astronomy* (Cambridge, 1918); H. Andoyer, *Cours de Mécanique Céleste*, vol. i, (Paris, 1923); J. H. Jeans, *Problems of Cosmogony and Stellar Dynamics* (Cambridge, 1919); T. C. Chamberlin, *The Origin of the Earth* (Chicago, 1916).

ASTROPHYSICS. See ASTRONOMY; PHYSICS.

ATAVISM. See HEREDITY.

ATHEARN, WALTER SCOTT (1872-). An author and professor of religious education at Boston University. He was born at

Marengo, Iowa, and educated at the State University of Iowa and the University of Chicago. He began his career as a public school principal in Iowa, and after holding professorships of religious education he became in 1919 director of the School of Religious Education and Social Service. He has written numerous books on religious education which include *Religious Education and American Democracy* (1917), *Making Democracy Safe for the World* (Chicago, 1918), *A National System of Education* (New York, 1920), and *Ten Lessons on the Organization of the Modern Sunday School* (St. Louis, 1921).

ATHERTON, GERTRUDE FRANKLIN 1857-). An American novelist (see VOL. II). Mrs. Atherton has continued her prolific authorship with her characteristic verve. She published *Perch of the Devil* in 1914; *California—an Intimate History* (1914); *Before the Gringo Came* (1915); *Mrs. Balfame* (1916); *The Living Present* (1917); *The White Morning* (1918); *The Avalanche* (1919); *Sisters-in-Law* (1921); *Sleeping Fires* (1922); and *Black Oxen* (1923).

ATHLETICS. Interest in athletics of every description increased at a remarkable rate during the period 1914-1924 despite the fact that the World War intervened to curtail participation in sports among the peoples of many nations. Perhaps the most striking feature of recent athletic history has been the growing popularity of international competition, along with the adoption of sports by countries in which formerly they were practically ignored. At the close of the period, it is true, the United States and the British Empire were still leading in their devotion to athletics of all sorts but other countries were rapidly falling into line and promising soon to threaten Anglo-Saxon supremacy, France, Italy, Spain, Japan, the Philippines, Sweden, Norway, Denmark, Finland and even the youthful Czecho-Slovakia having taken up athletics on a scale never attempted before.

Another noticeable development has been the increased participation in sports among women, Olympic Games (q.v.) for women having been held for the first time at Paris in 1922. The popularity of golf and tennis, particularly, with women has led to several international competitions in these sports. International rivalry between women swimmers has also been keen.

Several new world records were established in track and field athletics since 1914. James E. Meredith of the University of Pennsylvania ran the quarter-mile in 47 $\frac{3}{4}$ seconds and the half-mile in 1 minute 52 $\frac{1}{2}$ seconds in 1916 and Norman S. Taber of Brown University set a new record of 4 minutes, 12 $\frac{1}{2}$ seconds for the mile the same year. Edward Gourdin of Harvard University made the longest broad jump yet accomplished in 1921, his leap having been 25 feet, 3 inches.

Special articles on the various branches of athletics or sports such as BASEBALL, BASKETBALL, FOOTBALL, GOLF, TENNIS, etc., will be found under those titles.

ATHLETICS, TRACK AND FIELD. This particular branch of sports leads all others in the progress made during the ten-year period ending with 1924. The growth in popularity and the achievements as measured by the amazingly large number of new records established

which have characterized track and field athletics furthermore have not been confined to any one country. This fact may be attributed largely to the constantly increasing interest attracted by the Olympic Games (q.v.).

A complete summary of the new standards set in this sport would require more space than is available. The most that can be done is to select a few outstanding names and performances from the long list evolved from 1914 to 1924.

Among the runners who have distinguished themselves are James E. Meredith, Charles W. Paddock, Joie W. Ray and Norman S. Taber of the United States and Paavo Nurmi of Finland. Meredith eclipsed all past performances by covering 440 yards in 47 $\frac{3}{4}$ seconds and 880 yards in 1 minute, 52 $\frac{1}{2}$ seconds. Both of these new records were made in 1916.

Paddock ran 220 yards in 20 $\frac{1}{2}$ seconds in 1921. Taber negotiated the mile in 4 minutes, 12 $\frac{1}{2}$ seconds in 1916. Nurmi, specializing in the longer distances, ran three miles in 14 minutes, 8 $\frac{1}{2}$ seconds and also set new times for 2000, 3000, 5000 and 10,000 meters. All these achievements came in 1922. Ray, a consistently remarkable runner, owes his chief fame to the figures he established in 1923 for two miles. They were 9 minutes, 8 $\frac{1}{2}$ seconds.

Athletes from Canada and Denmark divide the honors in walking. George H. Goulding of Canada covered seven miles in 50 minutes, 40 $\frac{1}{2}$ seconds in 1915. G. Rasmussen of Denmark in 1918 outdid all previous walking efforts for practically every metric distance from 3000 to 15,000 meters and N. Petersen of the same country lowered all former marks for 20,000 and 25,000 meters.

E. Beeson of the United States surpassed all rivals in the running high jump by leaping 6 feet, 7 $\frac{1}{2}$ inches in 1914 and in pole vaulting Charles Hoff of Denmark attained the height of 13 feet, 6 inches in 1922.

E. J. Thomson of Canada tied the record of 14 $\frac{1}{2}$ seconds for the 120-yard high hurdles in 1920 and also established the new time of 14 $\frac{1}{2}$ seconds for the 110 meter high hurdles the same year. J. K. Norton of the United States went over the 440-yard hurdles (3 feet) in 54 $\frac{1}{2}$ seconds in 1920.

The United States excelled all other nations in relay racing. In 1921 a team consisting of B. D. Wefers, jr., H. Ray, F. K. Lovejoy and Edward Farrell ran 440 yards in 42 $\frac{1}{2}$ seconds and 880 yards in 1 minute, 27 $\frac{1}{2}$ seconds. During the same year another American quartette, C. D. Rogers, Lawrence Brown, Earl Eby and Robert Maxam sped one mile in 3 minutes, 16 $\frac{1}{2}$ seconds and in 1922 G. F. Meredith, E. W. McMullen, J. C. Holden and L. A. Brown ran two miles in 7 minutes, 49 $\frac{1}{2}$ seconds and Howard Yates, G. McGinness, B. Patterson and R. Wharton traveled four miles in 17 minutes, 45 seconds.

The participation of women in track and field athletics on a wider scale than ever before was a noteworthy feature of the 1914-24 period. The Amateur Athletic Union of the United States gave its first official sanction to a women's national championship in 1923 and the competitions were held in Newark, N. J. An Olympic Meet for women also was held at Paris in 1922. Twelve new world and Olympic records were set during the Olympic Games (q.v.) of 1924, of which seven were accepted by the International Amateur Federation.

ATLANTA. The capital of Georgia. The population of the city rose from 154,839 in 1910 to 203,550 in 1920; to 222,963 by estimate of the Bureau of the Census for 1923, and to 249,300 by local estimate in 1924. The area of the city was increased to 29 square miles by the annexation in 1922 of the neighboring town of Kirkwood. Three hundred acres in the residential section were razed by fire in 1917 with a loss of \$5,000,000. Building operations increased from \$3,685,663 in 1916 to \$20,584,734 in 1922 and to \$27,094,912 in 1923, while real estate values rose 35 per cent between 1918 and 1923. The bank clearings of the city increased from \$574,164,917 in 1910 to \$2,791,411,000 in 1923. A comprehensive zoning ordinance with racial segregation districts was adopted in 1923. The city spent \$4,000,000 to extend the public school system, the same amount for the reconstruction and extension of the sewer system, \$2,850,000 for improvements in the department of water works, \$750,000 for a large viaduct from Spring Street to Terminal Station, and \$400,000 for a centrally located public market. Fulton County built a court house in the city at a cost of \$1,200,000.

Two universities were opened during the period, Emory University of the Methodist Episcopal Church, South, which moved to Atlanta in 1914, and Oglethorpe University, which was closed shortly after the Civil War, reopened in 1916. A new hospital conducted by Emory University was completed in 1924 at a cost of \$2,000,000. Three large new hotels were built, costing \$6,500,000, \$1,250,000, and \$1,000,000. A colossal memorial to the Confederacy was being carved by Gutzon Borglum on the face of Stone Mountain, a great monolith of smooth solid granite near Atlanta. The finished work was to represent Lee and Jackson at the head of their armies, in January, 1924, the head of General Lee was unveiled.

ATMOSPHERE. See METEOROLOGY.

ATOMS, ATOMIC THEORY. See CHEMISTRY; PHYSICS.

ATONALISM. See MUSIC.

ATTENTION. The development of the psychology of attention, 1914-24, has shown the two-fold nature of the problem. On the one hand attention can be expressed in terms of physical conditions, the conditions which attract or distract attention, and on the other hand it can be assimilated to subjective interest with peculiar laws of its own. The experiments of Dallenbach and Bowman sought to measure the importance of size, form, and intensity of stimulus as determinants of attention, but these relationships seem to be largely empirical and do not obey any comprehensive law. They also indicated that attention varies with the different modalities of sensation, attention to touch being highest, with sound and light following in the order named. Liddell (*American Journal of Psychology*, 1920 vol. xxx, p. 241) sought to verify the theory that attention waves in vision are due on the one hand to the adaptation of the part of the retina stimulated and on the other to eye movements. By using the Dodge apparatus he photographed the eye movements simultaneously with the disappearances and appearances of minimal light. The result showed no correlation between the movements and the fluctuations of attention. The waves appeared to continue while the eyes were stationary, while movements neither brought back the light

during periods of no sensation nor prevented its disappearance during the periods of visibility.

In France and Italy attention was studied from the point of view of subjective interest Professor Janet (*Journal de Psychologie*, 1921, vol xviii, p 140) on the basis of his observations of neurasthenics brought out the intimate relation between the oscillations of nervous tension and the emotional condition of the subject. Rignano also championed an affective theory of attention. See ACTION; PERCEPTION.

ATTERBERG, KURT (1887-). A Swedish composer, born at Göteborg, Dec. 12, 1887. After graduation as a civil engineer, in 1910, he studied composition in Stockholm with A. Hallen for one year, when he won the state stipend enabling him to continue his studies at the Hochschule in Berlin and with Schillings at Stuttgart, in conducting. He conducted symphony concerts in Stockholm, Göteborg, and Malmö, and in 1920 made a very successful tour of Germany as conductor of his own works. His compositions, avoiding all modernistic extravagances, have placed him in the front rank of Swedish composers. He has written five symphonies, a concert overture in A minor, a violin concerto, a cello concerto, *Vastkustbilder* and a *Rhapsody* for orchestra, a symphonic poem for baritone and orchestra, a *Requiem*, incidental music to Didring's *Jefta*, a pantomime-ballet (*Der Svinaherde*), and an opera, *Herwarth der Harfner* (Stockholm, 1921).

ATTEBURY, GROSVENOR (1869-). An American architect, born in Detroit. He graduated from Yale in 1891 and studied architecture at Columbia University and in Paris. He made a special study of town planning and industrial housing. His best known work is in connection with the development of the Forest Hill Gardens in Long Island, founded by the Russell Sage Foundation. He also planned several industrial communities. He was architect for the restoration of the New York City Hall, and for other important buildings in New York, Philadelphia, and other cities. He was an Associate of the National Academy and was chairman and director of the War Industry Housing Commission of the National Housing Association during the War. He served with the Army Educational Commission in France and was supervising architect of the A. E. F. University at Beaune, France.

ATTERBURY, WILLIAM WALLACE (1866-). An American railway official (see Vol II). During the War he was decorated many times for his invaluable service in directing the construction and operation of United States military railways in France. He was appointed commanding brigadier general in 1917. After 1919 he returned to the corporate service of the Pennsylvania Railroad and later devoted himself to the study of foreign railway systems.

ATTERIDGE, HAROLD RICHARD (1886-). An American playwright and librettist. He was born at Lake Forest, Ill., and educated at the University of Chicago. He is well known as the author of many popular musical comedies, and especially of *The Passing Show* (New York, 1912-19). Following are some of his works, all written in collaboration: *The Honey-moon Express* (New York, 1913); *Dancing Around* (New York, 1914); *Maid in America* (New York, 1915); *Robinson Crusoe, Jr.* (New

York, 1916); *Over the Top* (New York, 1917); *Sinbad* (New York, 1918); *Monte Cristo, Jr.* (New York, 1919); *The Little Blue Devil* (New York, 1919); and *Bombo* (New York, 1921).

ATTRIBUTE. In psychology, a unit of experience supplanting an earlier unit sensation. The impossibility of producing in the laboratory a pure sensation and the necessity of introspecting only on the attributes of sensational experience, such as quality, duration, intensity, etc., led to a revision of terminology. Psychological experience is regarded by the Titchener school as a process of which we are able to observe only the changing attributes. See PSYCHOLOGY.

ATWOOD, ALBERT WILLIAM (1879-). An American writer and lecturer on financial topics, born at Jersey City and educated at Amherst College. He was financial editor of the *New York Press* (1906-12) and in 1915 joined the faculty of the School of Journalism of Columbia University. He contributed financial articles regularly to a number of magazines, including the *Saturday Evening Post*, *McClure's Magazine*, and the *Review of Reviews*. He was the joint author with Thomas Conway, Jr., of *Investment and Speculation* (1911); *How to Get Ahead* (1917); *The Exchanges and Speculation* (1917); and *Putnam's Investment Handbook* (1919).

ATWOOD, WALLACE WALTER (1872-). An American geologist, born at Chicago, Ill. He was graduated in 1897 at the University of Chicago. Meanwhile he began his career as a teacher of physiography in Lewis Institute in Chicago, whose director he became in 1900. He returned in that year to his alma mater and in 1910 became associate professor of physiography and general geology. In 1913 he was called to the chair of physiography in Harvard and remained there until 1920, when he accepted the presidency of Clark University with the chair of physical geography. As early as 1901 he became connected with the United States Geological Survey, in which since 1909 he has held the rank of geologist; he has had a similar relation since 1906 to the Illinois Geological Survey. His many researches have included studies on the physical geography of the Devil's Lake Region and of the Evanston-Waukegan Region of Illinois. The glaciation of the Rocky Mountain Region has received his attention, especially that of the Uintah and Wasatch mountains, and he has written a monograph on the economic geology of Alaska, especially the coal resources.

AUDITION. Among the significant developments of 1914-24 in the psychology of audition was a new theory of audition by Sir Thomas Wrightson published in his *Inquiry into the Analytical Mechanism of the Internal Ear* (1918). On the basis of new histological researches he argued against the tenability of Helmholtz's resonance theory and advocated the substitution of a pressure-balance theory of hearing. Much experimentation and discussion were devoted to the determination of the attributes of sound. Watt in his *Psychology of Sound* (1917) pleaded for a uniformity of attributes in all sense modalities. He accounted for pitch by the attribute of order and regarded volume as extensity. He brought forward a theory of auditory space paralleling the space of vision. Ogden, discussing the work of Koehler and Revesez, would have psychologists ac-

cept the attributes of pitch, volume, intensity, duration, and, probably, brightness. On the other hand Rich's experiments (*American Journal of Psychology*, 1919, vol. xxx, p. 121) seemed to point to the identity of pitch and brightness, but to make tonality a separate attribute. The existence of an after-image in audition analogous to the after-image of vision was called into question by H. G. Bishop (*American Journal of Psychology*, 1921, vol. xxxii, p. 305). Tones, he found, have a characteristic modified ending which depends for its intensity upon the intensity of stimulus and for its insistence upon intensity and duration of stimulation. Localization, investigated by H. M. Halverson (*American Journal of Psychology*, 1923, vol. xxxiv, p. 178), is found to be dependent both on difference of phase and on intensity, with the phase relation more important. See **PSYCHOLOGY, EXPERIMENTAL**.

AUER, JOHN (1875-). An American physiologist born at Rochester, N. Y. He graduated from the University of Michigan in 1898 and four years later received his degree of doctor of medicine from Johns Hopkins. During the period 1908-21, he was an Associate Fellow of the Rockefeller Institute and conducted research into many physiological and pharmacological subjects, in part in association with Dr. Meitzer. Since 1921 he has been professor of pharmacology at the St. Louis University School of Medicine.

AUER, LEOPOLD. A Hungarian violinist and teacher (see VOL. II). On Mar. 23, 1918, he made his American debut in New York, where he settled permanently as a teacher. In the fall of 1919 he undertook the regular instruction of a master-class for two months, September and October, at the Chicago Musical College. Among his numerous pupils the most famous are Heifetz, Elman, Zimbalist, Kathleen Parlow, and Cecilia Hansen. The fundamental principles of his method were published by his pupil Maia Bang in her *Elementary Violin Method* (New York, 1920). He himself wrote a more extended treatise, *Violin Playing as I Teach It* (New York, 1921), and is the author of *My Long Life in Music* (1923).

AUGSPURG, ANITA (1857-). An active worker and lecturer in the German women's movement and in municipal and communal reforms. She came from a long line of lawyer ancestors, residents of Bavaria, and after studying drama and appearing for a short time on the stage, took up law and practiced for some years in Munich. She was identified with propaganda for radical reforms concerning women and children. Later she studied agriculture and managed her own large estate.

AULARD, (FRANÇOIS VICTOR) ALPHONSE (1849-). A French historian (see VOL. II). Professor Aulard was active both during the War and after the Armistice. His work falls under two heads. On the one hand he continued his scholarly researches as a historian of the French Revolution, and on the other he sought to popularize the lessons of history in their bearing on the problems of war and peace. His scholarly works include the *Recueil des Actes du Comité du Salut Public*, which by 1918 he had carried forward to the year 1796; *Paris sous l'Empire*, three vols. to the year 1809 (1910); *Lettres et Bulletins de Barentin à Louis XVI, avril-juillet 1789* (1915); and the *Dictionnaires des Conventionnels de Auguste*

Kuscinski (1916-1919). In 1919 he published a volume of historical interpretation, *La Révolution Française et le Régime Féodal*. His popular work comprises a volume of war articles, *La Guerre Actuelle Commentée par l'Histoire* (1916), and two series of public courses at the Sorbonne on the French tradition, *La Paix Rature d'après la Révolution Française et Kant* (1915) and *Le Patriotisme Français de la Renaissance à la Révolution*. Since the Armistice, Professor Aulard has thrown his influence on the side of political liberalism. He was a candidate to the Chamber of Deputies in 1919, running as Républicain Socialiste, but was defeated in the overwhelming victory of the Bloc National. By his articles in *l'Ère Nouvelle* and *Progrès Civique*, by his speeches, and by his representation of France in the League of Nations Assembly, he has sought to bring about a reconciliation between France and the new democratic Germany.

AULTMAN, DWIGHT EDWARD (1872-). An American army officer, graduated from the United States Military Academy in 1894 and promoted through the grades so that he reached the rank of brigadier-general of the United States Army in 1921. He was sent on a special mission to Germany in 1914-15, was instructor in the Army War College (1916-17) and went to France as commander of the Fifth Field Artillery (1918). He was at the General Staff College in 1919.

AUSTIN, MARY HUNTER (1868-). An American author and playwright (see VOL. II). Only after profound reflection did Mrs. Austin publish the results of her study of Indians in the western deserts of America. Her recent works, characterized above all by uncommon breadth of sympathy, include *Love and the Soul-Maker* (1914); *The Man Jesus* (1915); *The Man Who Didn't Believe in Christmas*, a play, produced in New York (1916); *The Young Woman Citizen* (1918); *Outland* (1919); a chapter on *Aboriginal Literature in Cambridge History of American Literature* (1919); and *26 Jayne Street* (1920).

AUSTRALIA. A self-governing British dominion including the island continent with its dependencies. The six states, New South Wales, Victoria, Queensland, South Australia, Western Australia, and Tasmania, and the two territories, Northern Territory and Federal Territory, which make it up, comprise an area of 2,974,581 square miles, and a population in 1922, exclusive of aborigines, of 5,634,552. In 1911, the inhabitants numbered 4,455,105. By the 1911 census there were 108 males to 100 females; by the 1921 census, the ratio had fallen to 103.3 males to 100 females. Immigration was slow, to the disadvantage of the development of the Commonwealth, which has unbounded natural resources and the ability to support a population as great as that of the United States. During 1911-21 the excess of immigrants over emigrants was only 166,977, as compared with 46,695 in 1911 alone. In 1921, net immigration was only 15,789. The population was almost wholly of British origin (97 per cent), highly literate, and well-to-do. The country's development had taken an unfortunate turn in the concentration of population in the cities and with the increasing application to industrial activities, to the neglect of the agricultural. For the Commonwealth, 62 per cent of the population was urban in

1921; 42 per cent of the total population was gathered in the six capital cities alone, as against 38.05 per cent in 1911. The capital cities, with their metropolitan populations in 1921 (1911 population in parentheses), were Sydney, N. S. W., 899,099 (629,503); Melbourne, Vic, 766,506 (588,971); Brisbane, Qld., 210,032 (139,480); Adelaide, S. A., 255,481 (189,646); Perth, W. A., 154,866; Hobart, Tas., 52,391 (39,937). As a result, Australia's problems of health, education, and social relations were largely those of an industrial society, not those of an agrarian one.

Agriculture. Up to 1920, 40 per cent of the total acreage of the Commonwealth was still unoccupied; only 5.73 per cent had been actually alienated; and 51 per cent was held under leases. Of the 109,074,863 acres alienated in the fiscal year 1921-22, 15,363,999 acres were under crops. This compares favorably with the crop acreage of 11,893,838 for 1910-11. The following table gives acreage and production of principal crops for 1912-13 and 1921-22.

Crop	Acreage		Yield	
	1912-13	1921-22	1912-13	1921-22
Wheat	7,839,651	9,719,070	91,981,070 bu.	129,088,806 bu.
Oats	874,284	737,830	16,116,712 "	12,123,078 "
Corn	314,686	305,200	8,356,158 "	7,840,446 "
Hay	3,217,041	3,005,057	3,372,596 long tons	3,905,428 long tons
Sugar Cane	155,567	197,293	1,135,141 "	2,436,890 "

Pastoral activities remained highly important. The figures for live stock for 1913 and 1921 were: sheep, 85,057,402 and 82,226,470; cattle, 11,483,882 and 14,530,081; horses, 2,521,983 and 2,439,444; pigs, 800,505 and 960,385. The wool yield in 1912-13 was 648,851,913 lb; in 1921-22, 628,664,435 lb.; butter, in 1912-13, 198,758,238 lb.; and in 1920-21, 261,722,367 lb. It was not until 1922 that the wool industry showed an approximation to pre-war conditions. Heavy stocks had accumulated because of war conditions, a diminished world demand, and the fall in prices. Only in 1922, as a result of the heroic operation of the British-Australian Wool Realization Association, es-

largely affected by the high prices of coal and coke, the high transport and labor costs, and the high smelting charges. Coal production, however, did not fall off. In 1914, 12,445,073 tons were mined, and in 1922, 12,403,133 tons; about 90 per cent of the total yield came from New South Wales. From 1917 to Dec. 31, 1922, the industry was controlled by the government, and prices and wages were fixed.

Manufacturing. Here was to be seen the Commonwealth's greatest advance during the period surveyed. From 1911 to 1921 the number of employees in Australian factories increased from 312,000 to 387,000, the amount of wages paid rose from \$118,200,000 to \$245,700,000, and the values of output advanced from \$518,700,000 to \$1,267,500,000. Aided by the heavy protective tariff of 1920, manufacturers were able to weather the 1920-21 trade depression successfully. Foodstuffs, machinery, clothing, textiles, etc., remained leading industries. Imports of the following declined over the period, because local manufacturers began to supply

the domestic market: textiles and wearing apparel, confectionery, cement, toilet articles. There were government bounties for the manufacture of iron and steel and the production of shale oil. On the last, for example, £16,292 was paid on 1,737,845 gallons in 1920-21.

Commerce. The trade record over the period, for certain years, showed (conversions at par for 1913, \$3.96 for 1920-21, \$4.45 for 1921-22): imports for 1913, \$387,918,000; for 1920-21, \$638,827,000; and for 1921-22, \$440,733,000; exports for the same years, \$365,537,000, \$515,420,000, and \$569,375,000. Trade by principal commodities (in thousands of dollars);

Imports				Exports			
Commodities		1913	1921-22	Commodities		1913	1921-22
Textiles			\$107,947	Butter		\$17,350	\$35,545
Timber	\$14,719		11,317	Wheat, unprepared		38,871	127,467
Chassis for motor cars			13,042	Wool		127,877	218,491
Corn and flour			7,083	Flour		9,082	24,564
Tobacco		5,421	10,383	Gold	15,594
Tea		6,465	9,128				

tablished in 1921, was the large supply disposed of. During the period 1914-24 an increasing interest was manifested in cotton culture. In 1920 only 166 acres were under cotton; in 1923, the estimated acreage was 40,000. Bounties and a fixed price aided in the encouragement of the industry. There were bounties, too, on rice, coffee, cigar tobacco leaf, fibres, oil, dried fruits, sugar, and combed wool for export. See also RECLAMATION, LAND.

Minerals. The gold production continued steadily to decline, dropping in value from \$45,570,244 in 1913 to \$15,429,734 in 1921. The same was true of silver and lead (1913, \$22,924,566; 1921, \$6,822,164), copper (1913, \$15,888,482; 1921, \$3,563,115), and tin (1913, \$6,791,737 and 1921, \$1,846,840). All these were

The origin of imports showed interesting changes over the period. For 1911, 1919, and 1921-22, the percentages from the United Kingdom were 59, 37, and 51; from British possessions, 12.8, 22.1, and 13.6, according to estimates; from the United States, 11.5, 27.3, and 19. It is evident that the gains made by the United States during the War could not be entirely maintained. In the following commodities, first place was maintained by that nation in 1921-22: patent leathers, agricultural implements and machinery, motor cars, hardware, ironmongery, surgical instruments, linoleum, arms and munitions, and clocks. Exports were similarly apportioned for 1913 and 1920-21: United Kingdom, 44.3 and 51.1 per cent; British possessions, 12.6 and 19.7 per cent; and the United States, 3.3

and 7.5 per cent. Nothing indicated better how well Australian trade held its own than the tonnage figures for the period. In 1911, 4,993,220 tons entered as compared with 4,559,964 tons in 1921-22; and 4,991,581 tons cleared Australian ports in 1911 as compared with 4,520,909 in 1921-22. On June 30, 1923, the Commonwealth possessed 49 steamships of 252,524 gross tons, valued at £14,156,938; the first purchase was made in 1916. In August, 1923, a Federal Shipping Board was created to take over management.

Communications. From the 17,842 miles of lines in the Commonwealth in 1912, of which 16,898 miles were government-owned, railways increased to 25,956 miles (23,147 miles government-owned) in 1921-22. The leading difficulty confronting the Commonwealth was the variety of gauges in use. It was decided during the period to adopt a single standard gauge of 4 feet 8½ inches, but the cost was so great (\$277,000,000) that the work had to be deferred. Inasmuch as many of the railways were for developmental purposes, operating expenses continued to exceed revenues. The loss in operating the Commonwealth railways for 1920-21 was £455,200; while the loss to the state railways for the same year was reported as £4,013,146. A transcontinental railway from North to South, over 1000 miles in length, was under construction. Something of the progress made in railway building may be ascertained from the activities of a single year, 1922-23, i.e. miles of railway under construction and authorized in the different states: Victoria, 52 and 12; New South Wales, 783 and 100; Queensland, 552 and 1423; South Australia, 139 and 29; Western Australia, 136 and 229. By 1923, 143 miles had been electrified in Victoria, and Sydney was applying itself to the same task. Another interesting development was the work on a subway in the city of Sydney, at a cost of £5,000,000.

Finance. For 1911-12, revenues for the Commonwealth were £20,548,520, and expenditures £14,724,097. For 1921-22, these had reached £64,897,046 (revenues) and £77,930,426 (expenditures); and for 1923-24 revenues were estimated at £54,688,250 and expenditures at £54,641,098. An analysis of the 1921-22 budget reveals the changed character of government financing. Whereas before the War about two-thirds of the revenue was derived from customs, in the later year the proportions were: customs, 26.6 per cent; income tax, 26 per cent; excise tax, 16 per cent; land tax, 3.5 per cent; war-time profits tax, 2 per cent. The debts of the Commonwealth and the states increased enormously because of the War. In 1914 the total debt of the Commonwealth and states was £337,000,000; by June 30, 1923, the Commonwealth public debt was £410,996,316, and those of the states, £523,489,339. In fact, the total war expenditure for the seven years ending June 30, 1922, was £477,498,000, of which £135,340,000 was charged against revenue, while the remainder came from loans. Before the War (1906-13), the Commonwealth borrowed, for productive purposes, £3,401,237; during 1914-21, £12,656,407 was borrowed toward the same end. For the same periods, state borrowings totaled £88,471,724 and £146,295,100. The Commonwealth Bank, opened in 1913, had in 1921, £70,705,875 in deposits. On July 31, 1922, the Commonwealth had in circulation

£53,390,809 in notes, against which the gold reserve was 44.08 per cent of the total.

History. The year of the War's outbreak saw the installation of a Labor government in Australia. Mr. Cook's ministry had worked under the handicap of a Labor majority in the Senate since 1913, with the result that the new problems of war and Labor's increasing independence forced the dissolution of Parliament. In the elections of September, 1914, Labor's victory was impressive, the poll showing 41 seats to 33 for the Liberals in the lower house and 31 seats to 5 in the upper. Mr. Fisher now headed the cabinet. Under W. M. Hughes, who succeeded in October, 1915, Australia assumed a place of prominence in imperial if not in international affairs, for Australia was being watched with growing attention. Under Mr. Hughes's direction, Australia, once so completely indifferent to the purposes of imperialism, became the veritable storm-centre of imperial politics and presented the curious spectacle of a country, in spite of its distance from the main theatre of the War, rent by international dissensions. In all this the premier was the focal point. From 1915 to 1922 it may be said that his personality dominated the affairs of the Commonwealth. In 1916, on his return from England, he showed himself a die-hard, in spite of his Labor antecedents. His policy, plainly announced, called for a war waged to the finish; compulsory military service for home defense and overseas operations; imperial trade protection, and a closer imperial partnership. To Mr. Hughes it appeared that Australia's war effort was languishing, and that only the energetic measure of conscription could remedy the fault. At the outbreak of the War, Australia had seemed the most loyal of all the dominions. In September, 1914, an expedition had been equipped and despatched to German New Guinea and there had met with an easy and instantaneous success. Before the month was out, German New Guinea, German Samoa, and the Bismarck Archipelago were all in Australasian hands. Australians, in a steady stream, had left the country to fight at Gallipoli, in France, and in Palestine. But by 1916, it was plain that voluntary enlistments were diminishing. In June and July these were totaling only 6000 monthly. It was, therefore, to get out the 300,000 troops he had promised London that Mr. Hughes decided to resort to a conscription referendum. And it was here, too, that he met an organized opposition and was compelled to part company with his old party and even see himself expelled from it. The bitter campaign which preceded the vote showed that Labor was unalterably opposed. Four colleagues resigned before the balloting started. When the vote was finally announced, it was seen that conscription had been defeated: 1,146,000 against and 1,085,000 for. Around these two elements, therefore, the subsequent political struggles were to gather. On one side was the increasing intransigency of Labor; on the other was the fixed determination of Mr. Hughes and the conscriptionists to see the War through to a successful conclusion. In February, 1917, Hughesites and Liberals constituted a coalition government under the name Nationalist party, with Mr. Hughes as premier. In the general elections of May 5, 1917, the Nationalist party was returned, but with reduced majorities. Labor was recalcitrant. Strikes, which had be-

come frequent in 1916, took on a virulent form in 1917; many of them were protracted. For instance, the railway men of New South Wales went out in 1917 for six weeks and involved thousands of workers in allied industries. Nothing showed this temper better than the decisiveness with which Mr. Hughes' second conscription referendum was defeated in December, 1917. The majority this time was almost 200,000; that in New South Wales alone was 140,000. Thenceforth Labor's tone was almost revolutionary. Mr. Hughes steadily refused to resign in the face of his promise to regard the referendum vote as a test of confidence. Labor, in retaliation, issued a manifesto stigmatizing the War as of capitalist origin and calling for an immediate peace conference on the basis of evacuation of territories and self-determination; refused to coöperate in the speeding up of recruiting; and in June, 1918, at its annual convention, passed resolutions demanding an immediate cessation of hostilities. In the same month the important Australian Labor Conference met to congratulate Russia on the success of her revolution and to present a programme of peace terms as far-reaching as that of the British Labor Party. On this hostile note the War came to a conclusion.

For her size and resources, Australia's war effort was extraordinary. Recruiting brought 417,574 men under arms; of these 329,682 saw overseas service. Australians fought in France, at Gallipoli, and in the Near East. The small Australian fleet had been active, as witness the destruction of the *Emden* by the *Sydney*. Casualties showed 58,471 killed and died, 4264 prisoners, and 150,241 wounded. The attitude toward the returned soldier was generous. Employment was found for 121,330 ex-service men up to April, 1922, and of these, 22,444 were settled on the land, at a cost to the Commonwealth of £31,513,130. Besides, the Reparation Department provided pensions for 222,537 men, while £30,000,000 was distributed in gratuities. As far as the Commonwealth was concerned, the War cost £288,000,000. The country was organized for war service at home, too. Two measures, a National Defense Act and the War Precautions Act, provided for the calling of the full man power for local service, in the first case, and in the second, for the transference of every activity to a war basis. Under this dispensation the government proceeded to fix prices in every state, introduce a moratorium in the interest of debtors, and establish pools for leading products. Legislation, on every conceivable subject, could be put through by the mere gazetting of a regulation. As a result of this prerogative, two important tendencies manifested themselves. The government at times assumed arbitrary powers, interfering in freedom of speech and assembly and going so far in 1920 as to check a labor strike. Again, operating under the same act, it aided in the creation of a wheat pool (1915) and a wool pool (1916) for the handling and marketing of these commodities which played so important a part in the country's economic well-being. Wheat, for the five seasons of 1915-20, was sold largely to Great Britain, and 500,000,000 bushels were handled in this way. As for wool, in the four seasons 1916-20, 2,280,000,000 pounds were disposed of. The wool pool, under another form, a company called the British-Australian Wool Realization Association, succeeded in disposing

of the heavy carry-over stocks by 1922, so that even a profit accrued to the Australian growers. The result of all this was a very perceptible air of prosperity during 1916-20. Banks declared increased dividends and enlarged their capital; Australian companies sought investments abroad; and the annual agricultural shows were attended by record-breaking crowds.

At the Peace Conference Mr. Hughes displayed an extreme imperialistic attitude, and curiously enough, won the commendation of Englishmen rather than of Australians. His advocacy of a White Australia, through his objection to the Japanese amendment to the League of Nations covenant for the acceptance of the principle of racial equality, and his firmness with Germany, gave him an imperial reputation, while his position at home steadily weakened. Australians were beginning once more to display a greater concern over their local affairs, and their apathy with regard to larger issues was marked. In the period 1919-24, these matters were to the fore: Australian unification; the position of labor; economic and financial reconstruction. During the war period, but more particularly after, a large group of the population sought an aggrandizement of the Commonwealth's powers at the expense of the several states. During the War, the need for central agencies for the regulation of trade, commerce, prices, etc., was plainly perceptible, and Mr. Hughes was the leading advocate of centralization through the agency of constitutional amendments. But war measures gave him the powers he demanded, so that as the War progressed his interest diminished. From 1918 on, Labor became the leading champion of the movement; a powerful central government could more nearly control industry, effect common treatment of wage problems, and bring nationalization of key industries closer to realization. The result was that in the elections of December, 1919, Labor took its stand wholly on two referenda whose purpose was the incorporation of constitutional amendments aiming at such centralization. The measures were defeated, but agitation continued unchecked. Again, the post-war period showed a tightening of the lines of conflict in the body politic. Up to 1919, by the acceptance of the principle of a white Australia, the championing of a high protective tariff, and the favorable reception accorded the work of the Commonwealth Court of Conciliation, Labor had made a direct bid for middle-class support. The leading force was the Australian Workers' Union, organized like the American Federation of Labor on craft lines, and this body consistently applied itself to the formation of political programmes that could give offense to neither small shopkeepers nor small farmers. But the growing affluence of one section of the community, its increasing conservatism, and its hostility to the workers, gave impetus to a new radicalism. Industrial action rather than political gained currency, so that in 1919 the Left Wing of New South Wales Labor split off from the Australian Labor Party to champion the idea of the one big union. The creed became so popular that at the 1921 conference of the Australian Labor party, a plain attempt was made to win back the insurgents through the adoption of a radical programme. Industrial unionism was endorsed, the socialization of industry advocated, and the stamp of approval given a doctrine that was altogether

Marxian in its insistence upon class loyalty. Nor was Labor the only group to stress class feeling. The farmers, in 1919, for the first time entered the political scene with a party of their own, the Country party, and began to play an important rôle in the post-war elections. Their special concern was to combat the Socialist proposals of the Labor party and to oppose the further extension of the eight-hour day. Very perceptible hostilities thus appeared. The workers continued to flout the rulings of the Court of Conciliation, went on strike frequently, and demanded the establishment of a basic wage throughout the Commonwealth. On the other hand industry looked askance at the Court, too, for its inability to level down wages in times of stringency, as in 1921 and 1922. This profound disagreement was shown in the failure of the Economic Conference of February, 1922, to bring to a truce the two contending parties. Even Mr. Hughes, usually sanguine, confessed the inadequacy of the existing machinery.

Politics reflected these antipathies. Mr. Hughes was confronted by three hostile parties. Labor, the Liberals, and the Country Group. He decided, therefore, to hasten the general elections, and on Dec. 10, 1922, he went to the country on the record of his Nationalist administration during its six years in power. The results showed, in the lower House, 27 Nationalists, 29 Labor, 14 Country, 4 Liberal; in the upper, an increase of 11 seats for Labor to eight for the Nationalists. Mr. Hughes was discredited, and five of his ministers were defeated, so that on Feb. 3, 1923, he resigned. A new government was formed as a result of a Nationalist-Country-Liberal coalition, with Stanley M. Bruce as premier. The prevalence of new men was shown by the fact that seven cabinet members had had no previous Parliamentary experience, while Mr. Bruce had first been elected to Parliament in 1918, and Mr. Page, the Country leader, in 1919. The administration's programme accepted the necessity for unification in labor matters, taxation, and public works development, and advocated a strong defense programme and greater application to the problems of immigration and land settlement. Little of this was realized by 1924, for the government's leading concern was the keeping of Labor from power. In this they were temporarily successful, but early in 1924 the Country party ceased to support the Nationalist-Liberal coalition in state elections, and thus permitted Labor victories in Queensland, Tasmania, and West Australia. In the broader sphere of imperial politics, Premier Bruce showed himself no whit less aggressive than his predecessor. Representing Australia in the Imperial Conference which met at London in October, 1923, Mr. Bruce made an outspoken plea for the adoption by the mother country of a protective preferential tariff which would give Australian and other colonial producers of meat and grain an advantage over American exporters, who, he declared, were driving Australian growers out of business. On May 9, 1921, Australia established its civil administration in the former German possessions of Kaiser Wilhelm's Land (German New Guinea), Bismarck Archipelago, and the Solomon Islands, which had been assigned to Australia by the League of Nations under a Class C mandate, dated Dec. 17, 1920. The mandate permitted the Commonwealth to ex-

tend its laws to the mandated territory, but not to establish fortifications there. The governors-general over the period reviewed were: Sir R. Munro-Ferguson (1914-20) and Lord Forster (1920-). See also NAVIES OF THE WORLD.

Economic Conditions. In 1910, there were 482 trade unions with 302,119 members. During the War the increase was steady, so that in 1920, the 388 unions in existence had 684,540 members. The inability of the Conciliation Courts to cope with labor unrest is revealed by the following figures:

Year	Strikes	Workers Engaged	Days Lost
1913	208	33,493	628,528
1917	444	173,970	4,599,658
1919	460	157,591	6,308,226
1921	359	104,838	1,030,271

The war period, in particular, was characterized by strikes of long duration, many of them aimed at the government. In 1917, there were strikes among the railroad workers, the wharf laborers, and the seamen. In 1920, the teachers of Western Australia joined forces with the civil servants and went on strike to force a higher wage. The miners of the Broken Hill Association were out from May, 1919, to November, 1920. Prosperity was general during the period up to 1921, when the world depression made its mark on Australian industry, too. Prices rose during 1919, 1920, and 1921, to 186.33, on the index figures of 100 for 1914, but by 1922, they had dropped to 154. Wages were readjusted accordingly, and, in fact, remained higher in 1922 than prices. See EXPLORATION.

AUSTRALIA, EARLY PEOPLES OF. See ETHNOGRAPHY.

AUSTRIA, LOWER. A province of the Republic of Austria: In 1910 it had an area of 7654.4 square miles and a population of 3,531,814. In 1923, its area was 7451 square miles and its population 1,478,697. See AUSTRIAN REPUBLIC.

AUSTRIA, UPPER. A province of the Republic of Austria. Its area in 1910 and 1923 was 4626.3 square miles. Its population in 1910 was 853,006; in 1923, 873,702. See AUSTRIAN REPUBLIC.

AUSTRIA-HUNGARY, or THE AUSTRO-HUNGARIAN MONARCHY. In October, 1918, the Austro-Hungarian Monarchy collapsed. Out of its former constituent elements, the Austrian Empire and the Hungarian Monarchy, emerged a group of succession states whose territories were made up in whole or in part of the old Austrian and Hungarian provinces. Of these succession states, the following were formed entirely of Austrian and Hungarian territories: The Republic of Austria, the Kingdom of Hungary, and the Republic of Czecho-Slovakia. The new states of Poland, Jugo-Slavia, were formed, in part, of Austro-Hungarian territories. (See HUNGARY, CZECHO-SLOVAKIA, POLAND, JUGO-SLAVIA, as well as RUMANIA and ITALY, which also made territorial gains as a result of the dissolution of the Dual Monarchy, and TIROL, GERMAN SOUTH; KLAGENFURT BASIN, BURGENLAND, FRIUM-ADRIATIC CONTROVERSY, BANAT, TRANSYLVANIA, GALICIA, and TESCHEN, ZIPS, and ORAVA, scenes of territorial disputes arising out of the peace treaties.) In the article below will be found these discus-

sions: foreign policy of Austria-Hungary during the years 1914-18 (which is based to some extent on the researches and writings of the well-known Austrian historian, A. F. Pribram, notably his *Austrian Foreign Policy, 1908-18*; internal political history of the Austrian Empire, 1914-18; Economic history of the Austrian Empire, 1914-18. There is also an account of the history of the Austrian Republic, 1918-24. Hungary, 1914-24, is treated under the title HUNGARY.

Foreign Policy of Austria-Hungary, 1914-18. As a result of the Balkan Wars the Dual Monarchy suffered considerable loss of prestige. The weakening of its position in the Balkans, and the triumph of Serbia in the second Balkan War, were circumstances as unfavorable to the security of the Habsburg monarchy as they were favorable to the development of a violently anti-Serbian and anti-Slavic policy at Vienna, where it was keenly realized that among the 24,000,000 Slavic subjects of the Emperor-King no small number sympathized with Pan-Serbian and Pan-Slavic aims. In Serbia, the Viennese statesmen saw a direct menace to the Jugo-Slav provinces of Bosnia, Croatia-Slavonia, Dalmatia, and Carniola; and behind Serbian-Jugo-Slav nationalism they fancied they perceived a menacing Russian Pan-Slavic design which, if not balked, would culminate in the dismemberment of the polyglot Danubian monarchy. To regain prestige and influence in the Balkans seemed vitally necessary. But Austro-Hungarian diplomacy tried in vain to compose agreements between Bulgaria on the one hand and Rumania, Turkey, and possibly Greece, on the other. These efforts proved fruitless because of the divergent interests and the mutual distrust of the Balkan states. In fact they served to estrange Rumania and Bulgaria from Vienna, as the rapprochement between Rumania and Russia showed, following the meeting of King Charles and Czar Nicholas at Constanza on June 14, 1914. The treaty between Bulgaria and Turkey fell through, and so did the compromise between Rumania and Bulgaria and the attempt to bind Greece closer to the Triple Alliance. These difficulties were aggravated still more by the fact that Berlin and Vienna disagreed as to the service which the respective Balkan states would be able to render to the Triple Alliance. Berlin held that Bulgaria should be sacrificed to Rumania, while Vienna feared that in case Rumania should refuse to consider such a proposal, it would be confronted at some future time by a solid Balkan bloc under the leadership of Russia. Count Berchtold succeeded finally in convincing Berlin of the soundness of the Vienna viewpoint, and from March, 1914, the fundamental aim of the Balkan policy of the Central Powers was to bring Bulgaria entirely into their camp. At the same time the relations between the Dual Monarchy and Italy grew steadily colder, and although in the Conference of Abbazia, San Giuliano and Berchtold came to an agreement in April, 1914, it became clearer every day that soon the growing sympathy of the Italians for the Entente would seriously endanger the Triple Alliance. Vienna's apprehensions in regard to Italy and the ever-increasing influence of the Entente in that country were allayed, however, by the knowledge that negotiations were going on between the English and the

Germans for the establishment of more amicable relations. These efforts were heartily seconded by Count Mensdorf, the Austro-Hungarian Ambassador in London. Meanwhile Vienna believed that France and Russia had succeeded in creating a Balkan League and under that impression Konrad von Hotzendorf, chief of the general staff, drew up on June 22, 1914, a memorandum in which he painted the Balkan situation as very dark for Austria-Hungary and requested that Rumania be compelled to commit herself for or against the Central Powers and that in the latter case an alliance be formed with Bulgaria. A similar memorandum was prepared by Foreign Minister Berchtold for Berlin; in this the imperative need for the formation of a Balkan League, not including Serbia, and under the leadership of the Central Powers, was stressed. Before this memorandum could be presented, events occurred which immediately changed the entire situation. On June 23, 1914, Francis Ferdinand, the Austro-Hungarian heir to the throne, and his consort were assassinated at Sarajevo in Bosnia. The resulting Austro-Hungarian ultimatum to Serbia, and the outbreak of the War are described elsewhere (See WAR IN EUROPE). The above-described policy was of prime importance in bringing the War to pass. In taking a gambler's chance of crushing Serbia without Russian intervention, the reckless Berchtold was opposed by saner statesmen, notably Count Tisza, chief spokesman of the Hungarian ruling class.

Italy (q.v.) refused active aid to Austria-Hungary in her struggle with Serbia on the ground that her treaty did not oblige her to, but she raised the question of future compensation, a request which was granted by Vienna under pressure from Berlin, with the proviso that Italy would fulfill her treaty obligations. Italy denied again that a *casus fœderis* existed and remained neutral. Likewise Rumania failed to join the Central Powers, although she was promised Bessarabia. Rumania maintained that her construction of her treaty obligations did not warrant the abandonment of her neutrality. The Central Powers were more successful in regard to Turkey. The Austro-Hungarian Foreign Office supported all promises and concessions made by Germany to Turkey in the early weeks of the War for the purpose of inducing the latter to enter the camp of the Central Powers. All efforts on the part of Austria-Hungary, to have Bulgaria take an active part in the War against Serbia, so that her own armies might be released to meet the ever-growing pressure from the Russians on the eastern front, remained fruitless, because Ferdinand of Bulgaria was too clever to commit himself, until the military superiority of the Central Powers should be definitely established. Moreover, the Austro-Hungarian reverses had a bad effect in Sofia and especially in Bucharest, where Entente influences were growing steadily. Advice from Berlin in favor of territorial concessions to Rumania and later counsel not to oppose a march of Rumanian troops into Transylvania were strongly opposed by the Hungarians and hence not heeded by Berchtold. After the death of King Charles of Rumania on Oct. 10, 1914, the Rumanian situation became even more unsatisfactory, for Ferdinand, the new king, was less friendly to the Central Powers than his uncle had been.

and although he remained neutral, he would not bind himself to an agreement not to march against the Central Powers, in spite of all efforts made in this direction by Count Czernin, the able Austro-Hungarian Minister in Bucharest. Meanwhile the negotiations with Sofia advanced or lagged in accordance with the military victories or reverses of the Central Powers. Although in the beginning of 1915, Vienna, in conjunction with Berlin, was ready to grant the far-reaching territorial demands of Bulgaria, provided the latter country entered the War on the side of the Central Powers, Ferdinand of Bulgaria decided to remain neutral for the time being in view of the unfavorable military situation. During the remainder of 1914, Italy maintained her neutrality as well as cordial relations with the Entente. At the same time, the Italian government pressed its demands for territorial concessions and hinted at the Trentino. To this neither Berchtold nor Tisza, the Hungarian Premier, would listen, even though Berlin and the military leaders of the Dual Monarchy urged the purchase of Italian neutrality through such sacrifices. A few months after the death of San Giuliano, on Oct. 16, 1914, the situation became more critical. Regardless of Berchtold's previous refusals, Baron Sonnino, the new Italian Foreign Minister, let Vienna know plainly in December, 1914, all previous approaches in this direction having been made through Berlin as intermediary, that territorial concessions on the part of Austria-Hungary were desired by Italy as compensation for her future neutrality. New negotiations began thereupon between Rome and Vienna in the middle of December, but Berchtold still refused to consider the Italian demands. On Jan. 13, 1915, Count Berchtold was replaced by Baron Burian. In view of seemingly unfavorable military and diplomatic circumstances and under strong pressure from Germany, Burian opened in March, 1915, new negotiations with Italy, in the course of which the latter demanded extensive territorial concessions and the immediate transfer of the ceded districts. The latter demand was flatly rejected by Burian, but Italy was offered the major part of German South Tirol. This Sonnino refused to accept, and he presented on Apr. 10, 1915, a memorandum in which Italy demanded the whole of South Tirol, Gorizia, and Gradisca, and made a number of other requests, the fulfillment of which would have amounted in substance to the establishment of Italian supremacy in the Adriatic. Italy would promise neutrality for the duration of the War in return for these concessions. Due to the grave military situation at the time, Burian did not directly refuse these exorbitant demands but strove to keep the negotiations open and gradually increased his offers. His efforts were frustrated, however, by the conclusion of the Treaty of London on Apr. 26, 1915, under which Italy bound herself to join the Entente within a month. On May 3, 1915, Italy decided to declare its alliance with Austria-Hungary dissolved. Vienna was now willing to grant the full demands of the Italians, but without avail, for Italy declared war on the Dual Monarchy on May 23, 1915. For the subsequent developments of this territorial problem see TIROL, GERMAN SOUTH.

Vienna's tardy willingness to make great sacrifices for the sake of an understanding with

Italy had to a large extent been determined by the knowledge that Italy's declaration of war would ultimately be followed by that of Rumania, since on Feb. 6, 1915, the agreement of September, 1914, between Italy and Rumania had been renewed and had received an additional stipulation whereby the two countries pledged themselves to mutual assistance in case of an unprovoked attack on the part of Austria-Hungary on either one. As a result of the negotiations between Rome and Vienna, Bucharest had immediately increased its demands, which included now Transylvania in addition to the Bukovina. Vienna's refusal of these demands strengthened the influence of the Entente in Bucharest still further. The situation seemed critical for the Dual Monarchy, when suddenly the news of the great victory at Gorlice, May 2, 1915, arrived. This tremendous military success, and the subsequent events in Galicia and Poland during the summer of 1915, were powerful factors in helping the Rumanians to decide on neutrality for the time being. The Rumanian horizon cleared up, the Central Powers turned their chief attention to Bulgaria, for Turkey's lack of arms and ammunition made the establishment of direct land communication with that country necessary. During the first half of 1915 the Bulgarians had been continually negotiating with both the Central Powers and the Entente. Under the influence of the victories the prospects of the Central Powers in Sofia became much brighter, and on Sept. 6, 1915, treaties were signed between Austria-Hungary and Bulgaria, whereby Bulgaria pledged herself to enter the war against Serbia and was promised in return the whole of what is to-day Serbian Macedonia. It was further provided that, in case Rumania and Greece should enter the War on the Allies' side, Bulgaria should receive the territories ceded by her to these states under the Treaty of Bucharest (1913). With the conquest of Russian Poland in the summer of 1915, the Central Powers were confronted with the serious problem of the final disposition of that country. Various solutions advanced, such as the return of Poland to Russia, division of Poland between Germany and Austria-Hungary, annexation of the whole country by either one, or the creation of an independent Polish state under the tutelage of the Central Powers, were acceptable to neither. No agreement could be reached, till the defeat of the troops of the Dual Monarchy in the Brussiloff offensive of August, 1916, gave the German proposal for the creation of an independent state the preponderance. Still no definite steps were taken. A proclamation on Nov. 5, 1916, promised to the Poles the restoration of an independent Poland under a hereditary monarchy. Meanwhile the divided administration of the country by the Germans in Warsaw and the Austro-Hungarians in Lublin continued.

During 1916 the Central Powers carried on continuous negotiations with Rumania. Their offers, which were conditional on Rumania's entrance into the War on their side, were refused by the Rumanian statesmen, who were at the most prepared to concede only neutrality. Germany and the Austro-Hungarian High Command urged far-reaching concessions in the Bukovina and Transylvania, but Burian and the Hungarians were not willing to consider such proposals. At the same time the in-

fluence of the Entente in Bucharest grew stronger all the time and the Austro-Hungarian defeats in Russia in August, 1916, served to strengthen the conviction of the Rumanians that the ultimate superiority in the War lay with the Allies. Burian continued his steadfast refusal to grant the Rumanian demands and at the end of August, 1916, an agreement was concluded between the Allies and Rumania whereupon the latter, on August 27, entered the War against the Central Powers. In order to allay Turkish fears growing out of Rumania's entrance into the War, Germany concluded two agreements with Turkey on Jan. 11 and on Nov. 27, 1917, which provided for the abolition of the capitulations. The Dual Monarchy hesitated for a long time to come to similar agreements with Turkey, and only on Mar. 30, 1918, was a treaty signed between Turkey and Austria-Hungary under which the latter bound herself not to sign any peace re-establishing the capitulations. The weariness of the Austro-Hungarian people, who had suffered more from the War and were in a much weaker condition than their German allies, induced the Vienna government to address itself to Berlin in the fall of 1916 with the proposal to inquire through neutral channels whether the Allies were prepared for a discussion of peace. Germany objected, and for a time there was a lively exchange of opinion between the two governments. Finally an agreement was reached. Emperor Francis Joseph had died meanwhile, and Charles had ascended the throne. The latter was determined on the conclusion of a peace satisfactory to both sides. On Dec. 12, 1916, the Quadruple Alliance made its peace offer, proposing a conference of the Powers. Austria-Hungary at this time was ready to conclude a peace which left her territory intact and gave her minor frontier rectifications. The offer was met on Jan. 12, 1917, by the answer of the Allies to President Wilson's peace proposal. Thereupon Germany started her campaign of submarine warfare. Neither Count Czernin, who in the meantime had become Austro-Hungarian Foreign Minister, nor Emperor Charles entertained the sanguine hopes which the Germans placed on this policy, and they gave their consent to it only under pressure from the German statesmen and generals, and the Emperor. Czernin, in fact, pointed out the danger of war with the United States. While war broke out between Germany and the United States on Apr. 5, 1917, the United States did not declare war on Austria-Hungary until Dec. 7, 1917. As the results of unlimited submarine warfare fell short of expectation, Emperor Charles on Mar. 24, 1917, through his brother-in-law, Prince Sixtus of Bourbon-Parma, proposed peace pourparlers and assured France of Austrian support for her "just claims" on Alsace-Lorraine. On Mar. 27, 1917, Count Czernin, who knew the substance of the offer, but not the text, signed an agreement with the German Chancellor which contained a minimum and maximum programme for peace neither one of which provided for ceding Alsace-Lorraine to France. On Apr. 3, 1917, and repeatedly afterwards, Count Czernin approached the German Emperor and his statesmen with a peace proposal which suggested possible cession of Alsace-Lorraine to France, and, as compensation for this sacrifice, the annexation of Poland to Germany. Such a proposal the Germans re-

fused to consider. Shortly thereafter the Prince Sixtus move came to naught, because the Italians insisted on territorial concessions as promised by the London Treaty, which Austria-Hungary was not prepared to grant at this time. Under these circumstances Emperor Charles and Czernin concluded, on May 17-18, 1917, an agreement with Germany which provided for large Austro-Hungarian annexations in the Balkans, and, on the fulfillment of these conditions, for the surrender of Austro-Hungarian interests in Poland to Germany. Czernin, however, during the remainder of 1917, continued his efforts in various directions toward a peace by agreement, but without result.

A ray of light appeared with the Bolshevik ascent to power in the East. The new Russian government issued a summons for a general peace, and on the refusal of the Entente to consider it, began peace negotiations with the Quadruple Alliance on Jan. 9, 1918. Various difficulties arose, some of which led to the conclusion of Feb. 9, 1918, of a separate peace between the Ukrainians and the Quadruple Alliance. Under this peace the Austro-Hungarian frontiers remained unchanged, but the Dual Monarchy promised to surrender the district of Cholm, in Russian Poland, for incorporation into the Ukrainian Republic, and to make Galicia an autonomous Austrian Crownland. After further difficulties with the Soviet delegates, in which Czernin was often at variance with the German spokesmen and which brought about a temporary renewal of the war with Russia, a peace treaty was signed on Mar. 3, 1918, at Brest-Litovsk. From this peace the Dual Monarchy received no territorial enlargement. Poland, having become an independent state under the Brest-Litovsk Treaty, the Polish question came up once more. The decision of the previous year, to leave Poland to Germany, was abandoned, and Charles and Czernin advocated in its stead the Austro-Polish solution, which provided for the incorporation of Poland in Austria-Hungary. This scheme was opposed by the German government, which would merely consent to a personal union between Poland and the Dual Monarchy. This latter proposal Vienna refused to accept. The Poles made skillful use of this disagreement between the two Powers and obtained the signature of the latter to a protocol providing for a future rectification of the frontier between Poland and the Ukraine. Count Hertling, the German Chancellor, advised Vienna in July, 1918, that Germany would not accept the Austro-Polish solution and would leave it to the Poles to choose their form of government, provided that they came beforehand to an agreement with the Central Powers. Vienna accepted in principle, but succeeding negotiations failed to bring a solution. The peace with Russia led also to the signing of the Peace Treaty of Bucharest on May 7, 1918, which gave Austria-Hungary a strategic frontier with Rumania and valuable economic advantages.

The favorable settlements gained in the East could not, however, hide the grave condition of the Dual Monarchy, which was in urgent need of peace. Czernin, fully aware of this, attempted unsuccessfully in various ways in the early months of 1918 to bring about a cessation of hostilities. He even approached President Wilson through the King of Spain. The only possible road which could lead to peace for

Austria-Hungary, namely, the conclusion of a separate peace with the Allies, which would have been equivalent to leaving Germany in the lurch, Czernin refused to take. This he had stated on previous occasions, and did so again in his address to the Vienna Town Council in April, 1918. This latter statement led to the publication by Clemenceau of Emperor Charles's letter to Prince Sixtus in the previous year, in which reference had been made to the "just claims" of France on Alsace-Lorraine. Czernin, who had not been apprised of this reference, resigned thereupon and was succeeded by Burian. Charles had to make a penitient trip to German headquarters at Spa in order to appease Emperor William and was induced on May 12 to sign an agreement binding the Dual Monarchy closer than ever to Germany. The agreement, however, did not become effective, due to the breakdown of the negotiations on the Polish question, on which it had been made to depend. The ultimate failure of the great German effort in the West made the Germans more amenable to the Austro-Hungarian insistence on peace by diplomacy, although before August they had rejected all of Charles's and Burian's efforts in this direction. Since Vienna and Berlin could not agree on a proper course of action, Burian made finally, without Germany's participation, an appeal to the Allies which was turned down flatly and resulted in revealing to the Entente in a more glaring light than ever the desperate straits of the Dual Monarchy. The catastrophic military events of the early fall and the defection of Bulgaria and Turkey ushered in the last act of the drama. The Austrian collapse followed rapidly. Austria-Hungary and Germany appealed to President Wilson for an armistice. When Wilson failed to reply, Emperor Charles in a manifesto on October 16 proclaimed Austria a federal state. Wilson rejected the peace offer, finally declaring that the United States recognized Czecho-Slovakia as an independent state and acknowledged the national aspirations of the Southern Slavs. The dissolution becoming manifest now, Charles was ready to make a separate peace at great sacrifice, provided the territories remained under the dynasty, no matter in how loose a federation. On October 24 Count Andrány became Foreign Minister and three days later the pacifist Professor Lammasch was appointed Austrian Premier. New efforts for an armistice failed. The débâcle in Italy brought about the final disintegration. On November 3 the Dual Monarchy was forced to sign an armistice which turned her over, defenseless, into the hands of the victors and compelled her to give passive aid against her ally. Emperor Charles agreed to this under protest. But the catastrophe went still further. Charles gave up his share in the Austrian government on November 11, without, however, renouncing his crown. The Lammasch government finished its task of liquidation and resigned. The proclamation of the Austrian Republic on November 12 and of the Hungarian Republic on November 16 completed the disintegration of the Dual Monarchy. (For the Treaty of St. Germain and the Treaty of the Trianon, see PEACE CONFERENCE AND TREATIES.)

Internal Political History of the Austrian Empire, 1914-1918. All predictions to the contrary notwithstanding, the outbreak of the War evoked from the various nationalities com-

prising the Austrian Empire loud protestations of their loyalty to the dynasty and the state. Even the Czechs gave evidence of their enthusiastic support of Austria's cause in the War, and the Austrian Poles called for a union of Russian Poland and Galicia under the Habsburg crown. Likewise most of the Italians in the Tirol remained faithful after Italy's entrance into the War. In spite of these favorable demonstrations, the Austrian government did not deem it advisable to convoke Parliament. The ministry was in a position of almost complete political impotence and practically all control over internal affairs was in the hands of the military, which used rigid and shortsighted police measures. This system led finally to the assassination of the premier, Count Sturgkh, on Oct. 21, 1916, by the Socialist, Friedrich Adler. Under his successor, Dr. Körber, little change was wrought in the internal affairs of Austria. The only outstanding event of his administration was the creation of an Office for Food Control on Nov. 14, 1916, which was later enlarged into the Food Ministry. On the death of the aged Francis Joseph, Nov. 21, 1916, young Charles Francis Joseph, as the nearest heir, inherited his great-uncle's crown. Emperor Charles, ambitious and intelligent, was resolved not only to maintain the greatness of his dynasty, but also to effect a constitutional readjustment more satisfactory to the non-German peoples of the empire and to restore peace at the earliest opportunity. Himself assuming supreme command of the army, he proceeded to replace many of the highest officials with his own trusted friends. Hotzendorf was superseded by Aiz von Straussenburg as chief of staff; Foreign Minister Burian gave place to Count Ottokar Czernin; and Premier Körber, with whom the headstrong monarch disagreed on several issues, was dismissed on December 20, to be followed by a Czech nobleman, Count Clam-Martinitz, in whom Charles expected to find a more obedient agent for the execution of his policies. That the highhanded measures of the military rule and the economic hardships produced by the War had not yet at this time seriously affected the allegiance of the various nationalities to the Crown was evinced by the numerous declarations of loyalty which followed on President Wilson's note of Dec. 11, 1916, and the answer of the Entente of Jan. 12, 1917, in which reference had been made to the oppressed nationalities of Austria. At the same time, however, actual attempts at ironing out the conflicts and difficulties between the nationalities proved futile. On the final convocation of Parliament, on May 31, 1917, the Southern Slavs and the Czechs demanded the creation of a federal state, and the German Austrians offered strong opposition to any such proposal. Under these circumstances Clam-Martinitz, who had hoped for a national coalition, resigned on June 19, 1917, and was succeeded by Ritter von Seidler. On account of the amnesty granted the Czech political offenders on July 2, 1917, the German National Council at Prague passed on July 15 a vote of censure. With a reorganized cabinet, Seidler embarked in August, 1917, on a vast plan of social, economic, and political reform, which, however, proved a complete failure. In fact, his attempts at reconstructing the state on the basis of national autonomy served to reveal to

what extent dissolution had progressed. The nationalities advanced demands now which could hardly be reconciled with the unity of the Empire. The calling of a fresh Parliament on June 16, 1918, proved no remedy. The previous day, the Czechs had set up at Prague a national committee demanding a sovereign and independent Czecho-Slovak state. Seidler resigned on July 22, 1918. Baron Hussarek, his successor, attempted in vain to reconcile the nationalities. Disintegration had gone too. The Czechs won Allied recognition in August and were acting as an independent nation. The Poles, too, had become intractable, although Hussarek advocated Polish independence. As a last means to avoid dissolution, the Emperor issued on Oct. 16, 1918, his manifesto proposing a federal state for Austria. Its effects on the nationalities was null, because at the same time they were beginning to set up national councils. Disintegration was an established fact. The last imperial cabinet, the ministry of liquidation of the pacifist Lammasch, Oct. 27-31, 1918, could do no more than help the peaceful settlement between the rising Republic of Austria and the succession states, Czecho-Slovakia, Jugo-Slavia, and Poland.

Economic History of the Austrian Empire, 1914-1918. The outbreak of the War produced a serious economic crisis in Austria. Industrial production ceased almost entirely and the country was cut off from foreign markets. In agriculture great want of labor was encountered in bringing in the harvest. The government tried to meet the serious situation, but all that it could do was to close the Bourse and declare a moratorium. More than any governmental measures, the development of a war industry helped to improve the situation. The needs of the army stimulated production for military purposes, especially since only a very limited market could be found for non-military products. This transformation of Austrian industry took place within six months after the outbreak of the War. Soon, however, and in an increasing degree as the War progressed, Austria was faced with a shortage of raw materials, resulting from the blockade and the disruption of all communication between the Central Powers and the outside world. This was further aggravated by the fact that parts of the Austrian Empire which had been productive of raw materials were in the hands of the enemy. Moreover, economic union, so necessary in time of war, did not exist in the Dual Monarchy, and in the negotiations on economic matters Hungary, as the producer of foodstuffs, was often able to strike bargains which were greatly to the disadvantage of Austria. Shortage of raw materials and lack of foodstuffs forced the government soon to take measures for the regulation of supplies and to set up a rigid system of central control. A further step of the government in war economy was an agreement with the German government regarding the distribution of raw materials between the two powers. Austria followed Germany's example in creating central offices for the purchase of raw materials abroad. When this purchase was more and more curtailed and ceased in 1915, the central offices were transformed into a machinery to ensure the utmost economy in the use of raw materials within the country. The central offices, which were

composed of experts, supervised distribution and performed other duties in order to conserve or increase the stock of materials. Strict measures were used to regulate the supply of foodstuffs. For this purpose food cards were finally introduced. The entire traffic in grain was regulated by a Central Grain Traffic Office exercising absolute control over grain, flour, mills, and bakeries. It fixed the price of bread, determined its quality and rationed the supplies. For industries which employed grain as raw material, as for instance the brewing industry, offices similar to these central offices for raw materials were established. The functions of these offices were to regulate the distribution of supplies and to stimulate new methods of production in the industries. In short, the state set up a rigid system of centralized control over economic activities, which, if it did not function well, served at least the necessary purpose for which it was created. But rationing methods could not make up for lack of raw materials and foodstuffs. Not only did imports from abroad cease almost entirely, but production at home fell off for a number of reasons. Between 1914 and 1918 the crops decreased by more than 50 per cent through lack of labor, draft animals, implements, and manure. The substitutes which the people were taught to use were entirely inadequate. The population grew restive under the interminable hardships and deprivations, and labor became fruitful soil for revolutionary ideas. The War and the following collapse of the Empire left Austria economically destitute, but the subsequent settlement succeeded in making conditions even worse than they had been before.

AUSTRIAN REPUBLIC. The Austrian Empire had an area of 115,831.9 square miles and a population of 28,571,934 in 1910. As a result of the Treaty of St. Germain (Sept. 10, 1919), the plebiscite decision in the Klagenfurt (q.v.) district, and the ruling of the Council of Ambassadors with respect to the Burgenland (q.v.), the Austrian Republic had, in 1922, an area of 32,352 square miles and a population of 6,428,336 according to the census of 1920. The density per square mile was 199, females in the population were in the ratio of 1089 to 1000 males. The Republic consists of the following provinces: Vienna, Lower Austria, Upper Austria, Salzburg Styria, Carinthia, Tirol, Vorarlberg, Burgenland. The leading towns gave these population figures for 1920 (1910 figure in parentheses): Vienna, 1,841,749 (2,031,498); Graz, 157,644 (151,886); Linz, 94,072 (67,817); Innsbruck, 55,650 (53,194); Salzburg, 36,749 (36,210). From 1916 to 1919 deaths continued to exceed births, the excess being 31,815 in 1916, 66,877 in 1918, and 14,555 in 1919. Births in 1920 numbered 137,324, and deaths, 116,284. Distribution by religions was thus given in the 1910 census for all this area except Burgenland: Catholics, 5,979,667; Protestants, 165,007; Jews, 189,758. As for education, there were, in 1920, 4772 elementary schools attended by 888,640 pupils, 143 secondary schools with 40,257 pupils, 4438 of them girls; and three universities, viz., Vienna (11,442 students), Graz (1937 students), Innsbruck (1968 students). Besides, there were 2 technical high schools and 18 theological schools.

Industry. Agriculture formed the main oc-

cupation of the country. In 1921, 4,152,237 acres were under crops, largely in Lower Austria and Upper Austria. The main classes were: fields and gardens, 24 per cent; woods, 38 per cent; meadows, 11 per cent; pastures, 16 per cent; vineyards, 0.6 per cent. The leading crops were wheat, of which 177,715 metric tons were counted in 1922; rye, 334,311 tons; barley, 119,340 tons; oats, 275,788 tons; potatoes, 832,985 tons; turnips, 530,514 tons. In every case but the last, the yield surpassed that of the previous year. Deprived of the agricultural products of the rich provinces of Moravia, the Alpine forelands, Bohemia, Galicia, Istria, and Goritz, the Austrians were compelled, after the War, to import their food stocks from Hungary, Bohemia, Russia, and Rumania. In 1920, imports of grain and flour totaled \$58,200,000; in 1921, \$49,100,000. That the agricultural situation was gradually improving was indicated by a smaller importation for 1922, viz., \$36,900,000. Livestock numbered, in 1919: horses, 243,000; cows, 911,000; oxen, 214,000; bulls, 55,000; calves, 539,000; swine, 1,269,875; sheep, 300,000; goats, 300,000. Mineral supplies were scarcely adequate for local wants. In 1921, 2,469,701 metric tons of lignite coal were mined, and 137,666 tons of anthracite, while 5,842,978 tons had to be imported. Iron ore mined in 1920 totaled 435,062 tons, largely from Styria. Other minerals were copper, zinc, lead, and salt. The leading industrial centres were in Lower Austria, Vorarlberg, and Upper Styria, where iron foundries and machine, automobile, textile, and clothing factories were gathered. Chemical and paper goods works were grouped chiefly around Vienna, which was also the centre of the artistic trades.

Trade and Communications. The first years of the Republic showed heavy adverse balances, which, however, continued to decrease. In 1921, imports of 8,228,249 metric tons were valued at \$349,960,000; exports of 1,546,532 tons were valued at \$186,259,000. For 1922, imports weighed 7,448,737 tons and were worth \$327,721,000; exports were 2,115,760 tons, at a value of \$209,944,000. During 1922, the greatest amount of imports, by weight, came from Germany, 37.3 per cent; from Czecho-Slovakia, 37.1 per cent; from Hungary, 6.3 per cent. Exports to Germany amounted to 31 per cent of the total; to Italy, 19 per cent, and to Hungary, 11.9 per cent. Up to 1923 trade was hard hit by Germany's disastrous competition in foreign and domestic commerce. The situation improved after 1923, particularly with respect to the Balkan trade, because of the disorganization of German industry and transportation, consequent on the Ruhr occupation, and because of the German tendency to quote prices only in foreign currencies. In 1923, however, the unfavorable trade balance had mounted up to \$163,000,000. Replacements of depreciated stocks were heavy in this first year of Austria's reconstruction; imports were many to avoid future turnover taxes, and many purchases were made in Germany with the stabilized Austrian crown, all of which helped bring this about. The factors of invisible exchange were also effective. Vienna was the banking centre of the Succession States as well as the wholesale centre; Austria had large interests in the industries in the Succession States; the tourist trade was consider-

able. Discounting these conditions, the adverse balance was still high, and it was an important reason for Austria's economic plight.

The country had 4274 miles of railway, of which 2964 were state-owned. The principal lines were the Western, the Northern, North-western, Eastern, and Franz Josef Railways, the last connecting Vienna with Czecho-Slovakia. Not until July, 1923, was the government able to see its way out of the hopeless railway tangle. From the end of the War, the railways had been regularly operated at a loss, because the portion of the railway system left in Austria contained a high percentage of mountainous track, which, before the War, had been counterbalanced by the level stretches in the territories now belonging to Czecho-Slovakia, Hungary, and Poland; it was necessary to import fuel; a surplus of personnel prevailed; the government operation was unprofitable. To meet the situation, by the law of July 19, 1923, a corporation was created to conduct operation under a centralized control. The government financed the venture with a capital of 200,000,000 crowns and placed control in the hands of a directorate of 14, 11 of whom were to be business men or transportation experts, and 3, representatives of railway employees. To the government were reserved the rights to regulate tariffs, approve loans, supervise social and safety measures, and regulate construction. River traffic was equally hard hit by the loss of ships and barges during the War.

Finance. Nothing revealed so completely the helplessness of the country as the unsatisfactory condition of government finances. Revenues for 1921-22 were 93,325,000,000 paper crowns, or \$42,276,000; for 1922, they were 209,763,000,000 crowns, or \$169,698,000; for 1923, they were estimated at 11,488,267,000,000 crowns, or \$160,836,000. Expenditures for 1921-22 were 258,229,000,000 (\$116,978,000); for 1922, 347,533,000,000 (\$281,154,000); for 1923, 13,862,760,000,000 (\$194,079,000). Thus the deficits were \$74,701,000, \$111,456,000, and \$33,243,000. From 1919 to 1921 conditions steadily grew worse, so that on Jan. 11, 1921, the Austrian government confessed itself at the end of its resources and offered to turn over the country's administration to the Reparations Commission which the Treaty of St. Germain had established in the country. While the Supreme Council talked, the country's obligations continued to pile up. In 1921 it was estimated that Austria's share of the Dual Monarchy's debt was 53,200,000,000 crowns out of its total debt of 116,693,000,000 crowns, with an annual interest charge of 1,918,000,000 crowns. Finally, on Sept. 27, 1922, the League of Nations accepted responsibility for the economic rehabilitation of Austria, and in so doing, practically established a dictatorship over the Republic. The plan accepted included the placing of a loan of \$135,000,000 for 20 years among Italy, Great Britain, France, and Czecho-Slovakia; the appointment of a commissioner general by the League of Nations to direct expenditures; a committee of control to represent each of the guarantor governments; the setting aside of gross receipts from customs and the tobacco revenue as security; the promise on the part of Austria to eliminate the deficit by 1925. The Austrian government agreed to push retrenchments, cut down personnel, etc. On Feb. 1, 1923, the League of Nations author-

ized the issuance of the loan. Of this, American bankers took \$25,000,000, at 7 per cent for 20 years. On February 21, the Reparations Commission renounced all rights to Austrian property and revenues for 20 years. As an indication of good faith, the Austrian government between September, 1922, and October, 1923, dismissed 50,000 functionaries; on Nov. 22, 1922, heavy increases were announced in the income tax, the tax on shares, and the turnover tax. Under Dr. Zimmermann, the League Commissioner General, appointed in December, 1922, the financial reforms were pushed and the success with which they met was indicated by the fact that the draft budget of 1924 carried a deficit of 836,900,000,000 paper crowns as against the 1923 deficit of 2,664,200,000,000. Whether it would be possible to reach a balance by 1925 was problematical, for with the growing soundness of economic conditions it was inevitable that expenditures should increase, especially in the replacement and repair of depreciated equipments. It was plain in 1924 that the Austrian people were taking heart at the activities of their government and that such a return of confidence could not but augur well for the future. On Jan. 1, 1923, a new National Bank for Austria was opened with a capital of 30,000,000 gold crowns.

Economic Conditions. Its state condition made it inevitable that the Austrian Republic should turn to the printing press to meet current expenses. In June, 1919, 7,000,000,000 paper crowns were in circulation; at the end of 1920, 30,600,000,000 paper crowns, with a metallic reserve of 8,807,000 gold crowns; 1921, 181,000,000,000 paper crowns, with 10,022,000 gold crowns in reserve; 1922, 4,080,400,000,000 paper crowns, with 356,000 gold crowns in reserve. That the currency should depreciate with this unprecedented inflation was inevitable. The gold crown at par is worth \$.2026. On Jan. 1, 1922, the paper crown was worth \$.000387; on Jan. 1, 1923, \$.00014. The cost of living mounted. Compared with the figures for 1914, it rose to 13 in December, 1918; 69 in January, 1921; 662 in January, 1922; and 11,271 in December, 1922. Wages rose almost equally; on the same scale, the wage index for September, 1922, was 10,744. The establishment of the rehabilitation scheme at once changed tendencies for the better. In the first quarter of 1923, note circulation increased only 9 per cent, the metallic reserve increased; savings deposits became greater, and the cost of living index dropped 14 per cent. It is plain that these conditions had been merely the reflections of a general debilitation. Austria had been a manufacturing centre. After the War, the lack of raw materials, fuel, and grains brought on a complete breakdown. The government found it necessary to centralize trade in food, and in many instances, food stocks were sold to the public below their actual costs. To June, 1921, it was estimated that £32,500,000 was spent in foodstuffs by the government. Unemployment naturally mounted with the general breakdown. In May, 1919, 186,000 persons were out of work, 132,000 of them in the Vienna district alone. In April, 1920, the number had fallen to 46,000, with 38,000 in the Vienna district; by October, 1921, to 24,000 in the Vienna district. Thence forward it mounted again. December, 1922, saw 86,000 men out of work in Vienna, and January, 1923,

125,000; but in October, this figure had dropped to 77,900. The government applied itself to the problem of relief doles. In April, 1919, 46,000 were receiving aid, and not until May, 1920, was it able to put the situation on a scientific basis by the enactment of unemployment insurance legislation. It should be pointed out that the mounting unemployment of 1922-23 was a sign for the better. The exchange was now stabilized and industry was merely going through a transitional period. During these troublesome times measures were taken to render the lot of labor more comfortable. Many of these acts were of an advanced character. An eight-hour day was enforced, and laws were enacted for compulsory holidays, the legalizing of collective bargaining, the establishment of workers' councils in industry, and the building of houses by governmental agencies. For example, the city of Vienna, in 1923, made plans for the erection of 25,000 houses, workshops, and business places. These, then, were evidences of an economic and moral rehabilitation. At the close of 1923, observers saw Vienna regaining her position as a commercial and exchange centre of Southeast Europe. In 1923 alone, new capital investments in the country totaled 200,000,000. Three things were still needed, an intensification of agricultural methods, development of water power to eliminate heavy coal imports; and the breakdown of the customs barriers which the Succession States had erected.

History. The proclamation of the Republic of Austria on Nov. 12, 1918, left the country in a precarious political and economic situation. Its territory had been materially reduced and comprised not even all of the German language districts of the old Austrian Empire. The government was carried on by the provisional National Assembly which had convened on Oct. 21, 1918. On Feb. 16, 1919, a National Constituent Assembly was elected, in which the Socialists and the Christian Socialists held a majority. The Assembly elected the Socialist, Seitz, President of the new republic and appointed on Mar. 15, 1919, a ministry with Dr. Karl Renner as Chancellor. The new government launched a programme of extensive social and economic reform, including abolition of the feudal nobility and nationalization of the means of production; but confronted with serious internal difficulties, it was not able to proceed very far along these lines. As a result of the spread of revolutionary ideas and of the very bad economic conditions, notably the lack of foodstuffs, Communist agitation developed which had to be put down by force. The terms of the Treaty of St. Germain to which Chancellor Renner affixed his signature on Sept. 10, 1919, served to aggravate the internal situation still further. The only way out of what seemed an impossible state of affairs, by union with Germany, which, for political and economic reasons appealed strongly to the Austrian people, was blocked by the opposition of the victors. By Article II of the Fundamental Law of Nov. 12, 1918, German Austria had proclaimed itself a constituent portion of the German Republic, but despite the vigorous popular agitation, the actual union had not been consummated. This project was vetoed by Article 88 of the Treaty of St. Germain, inserted on French initiative and declaring the

independence of Austria inalienable without the consent of the Council of the League of Nations. The establishment of a Soviet Republic in Hungary strained relations with that country, for the Austrian government was in constant fear of a rising among its own ultra-radical elements with active support from the Hungarians, which, indeed, might have proved serious, since the feeble Austrian army was in part strongly Bolshevik in sympathy. Meanwhile the internal situation grew steadily worse. Except for the German language and nationality there was no bond of cohesion in this country, which, against its will, was forced by the dictum of the victors to exist as an independent state. The old antagonism between the city of Vienna, comprising one-fourth of the population of Austria, and the agricultural sections, which were unwilling to supply the food without which Vienna was doomed to starvation, assumed at times serious proportions and threatened the very existence of the metropolitan population. Under the grave circumstances a steadily growing and almost desperate desire for union with Germany manifested itself, both on the part of the country as a whole and of individual districts, especially Salzburg and the Tirol. On June 22, 1921, the Austrian Assembly voted to submit the project to a plebiscite. The Allies, however, particularly France, let it be known in various unofficial ways that, while they would not interfere with the plebiscite, they would regard any attempt at union with Germany as an infraction of the peace treaties and would take the proper steps to prevent it.

The withdrawal of socialist support from the coalition forced the ministry to resign on June 11, 1920. Pending a new general election, which was held on Oct. 17, 1920, the Christian Socialist Dr. Michael Mayr presided over a Proportional Cabinet representing all parties. The elections proved a victory for the moderate policy of the Christian Socialists, who obtained 82 seats as compared with 66 for the Social Democrats and 19 for the Pan-Germans. Dr. Mayr now formed a Christian Socialist cabinet, braving the open opposition of the Socialists. Dr. Michael Hainisch, well-known as a sociological writer and formerly a Socialist, but now rather non-partisan, was elected President of the Republic by the new Assembly on Dec. 9, 1920. A ray of light illumined the abysmal scene when the decision of the Klagenfurt plebiscite (q.v.), on Oct. 10, 1920, saved the territory for Austria. This was a valuable territorial acquisition in view of the agricultural productivity of the region. Another favorable turn was the admission of Austria into the League of Nations in December, 1920. But the economic plight of the country had grown worse meanwhile. With the approaching winter of 1920 Austria was in dire need of food and fuel. Her production of these necessities of life was small in comparison with her needs. Purchase of these commodities in foreign countries was precluded by lack of funds, a deficit in the budget, and an ever-mounting inflation of the currency. If anything, this situation became worse during the course of 1921, and it was evident that the unfortunate country was headed for disaster. By October of that year the crown had become practically worthless. While the people were facing famine, the government made desperate attempts to obtain financial aid abroad. In the spring of 1921 it

requested the Finance Committee of the League of Nations to procure the necessary funds for the purchase of foodstuffs. The League sent representatives to study the Austrian problem. Meanwhile the economic distress and the apparent uninterest of the outside world had made the Austrians even more weary of an independence which was forced on them and had stimulated the agitation for union with Germany. Alarmed by the extent of the movement, the Allies declared on Apr. 14, 1921, that all agitation toward this end must cease forthwith, lest the Allies withdraw their proposals for financial relief. The government was forced to curb the movement, whereupon a section of the Chancellor's party refused him support, compelling the Mayr Ministry to resign. Schober, the Police President of Vienna, formed a new cabinet in June, 1921. The threat of the Allies did not, however, prevent the people of Tirol on Apr. 24, 1921, nor those of Salzburg on May 29, from voting by overwhelming majorities in favor of union with Germany. Self-sufficient for food, these provinces could well afford to disregard the Allies' declaration. It is also true that the movement was only partially dictated by economic necessity and that political desires and nationalist aspirations were important in it. These plebiscites were, of course, ineffective except as indications of popular sentiment. The three-cornered controversy between Austria, Hungary, and the Allies regarding Burgenland (q.v.), a strip of western Hungary inhabited chiefly by Germans and ceded to Austria by the Treaties of St. Germain and the Trianon, was settled after long altercations and some violence by the assignment of most of the area to Austria and the return of a small portion, the Oedenburg or Sopron district, to Hungary, after a plebiscite held in that locality on Dec. 17, 1921, had shown its predominantly Hungarian sentiment.

The Schober cabinet was forced out of office in May, 1922, over a budget question. It was succeeded by a coalition cabinet under Dr. Ignaz Seip, the leader of the Christian Socialists. The desperate situation of the country at this time made some sort of action imperative. Austria had either to procure international financial assistance or unite with one of three neighboring countries, Italy, Germany, or Czecho-Slovakia. Italy addressed a note to the countries concerned announcing that she would consider union with Germany or the Little Entente a *casus belli*. Thus the only course open was to seek financial aid abroad. Toward this end Chancellor Seip appealed on Sept. 6, 1922, to the League of Nations. The latter adopted a plan for the restoration of Austrian finances, providing for an international loan of 650,000,000 gold crowns redeemable in 20 years, secured by Austrian productive assets and guaranteed by England, France, Italy, Belgium, Czecho-Slovakia, Spain, and Holland, and the creation of a commissioner general, appointed by the League to supervise Austrian expenditures. Moreover, a committee of control, consisting of one representative of each of the governments guaranteeing the loan, was to be set up. The guarantor states pledged themselves to respect Austrian sovereignty and independence, in return for which Austria agreed not to alienate her independence. This last clause was inserted in the agreement to prevent union with Germany. The plan also provided for certain

governmental reforms to insure economy. On Nov. 26, 1922, the plan of the League was approved by the Austrian Parliament, the Christian Socialists and the Pan-Germans voting for it and the Socialists against it. The plan was put into operation immediately with Dr. Alfred Zimmermann of Rotterdam as commissioner general. The methods of drastic financial surgery which were applied brought about as early as the spring of 1923 the stabilization of the paper crown and a reduction of the deficit in the budget, although unemployment increased. This increase was counteracted by an accompanying decrease in the cost of living and a revival of industry and trade which during the course of the year absorbed a great number of the government employees dismissed for reasons of economy. Slowly Austria progressed toward financial stability and economic reconstruction. This process of recovery lasted all through the year. By the end of 1923 Vienna was regaining her position as the commercial and exchange centre for the Danube Basin and Southern Europe. The activities of the League not only had a wholesome effect on the economic life of the country, but served also to dampen agitation for union with Germany, which in its extreme form had been largely an outgrowth of economic difficulties. That fact was demonstrated sufficiently by the elections for the Assembly on Oct. 20, 1923, in which the Pan-Germans and the Socialists suffered defeat at the hands of the Christian Socialists, who for the past year had looked with disfavor on the movement. The report of the Commissioner General at the end of the year showed clearly the great forward stride, which had been made during 1923 toward the complete economic recovery of Austria. The budget deficit had been cut in half, savings had multiplied, the currency had been stabilized, industry had been revived, and foreign capital was beginning to come into the country. The balancing of the budget was in sight. This recovery was accompanied by the establishment of more amicable relations with the succession states early in 1924. In the spring and summer of the latter year there began to appear evidences of a desire on the part of the Austrians to escape from the supervision of the League of Nations, although the budget had not yet been balanced. At this time there were also disagreements between the Austrian government and the commissioner over the methods of achieving a balanced budget. The Austrians preferred to do this by means of increased revenue, while the commissioner advocated reduction in expenditures. During the first half of 1924 came a marked increase in the cost of living. See **BURGENLAND**, **TIBOL**, **GERMAN SOUTH**; **NAVIES OF THE WORLD**.

The Austrian Constitution. On Oct. 1, 1920, a new constitution was promulgated which was a formidable document indeed and which went into much more detail than customary. It declared Austria a democratic republic, composed of seven states and the city of Vienna. Austria became thereby a federal state in place of the old Austrian centralized state. All privileges were abolished and equal rights were given to all citizens. Universal suffrage for women as well as for men was established, and the voting age was set at 21. Executive power was vested in a president chosen for four years and a cabinet appointed by the As-

sembly. Legislative power belonged to a Parliament of two chambers, an Assembly elected for four years by popular vote and in accordance with the principle of proportional representation, and an upper chamber elected by the provincial diets in proportion to the population of the states. Since the upper chamber was given only advisory powers, the Parliament consisted in fact of only one chamber. The President was to be elected in a joint session of both chambers.

AUTHORS' LEAGUE OF AMERICA, INC.

An organization founded in 1912 to provide mutual assistance in the technicalities and difficulties of publishing and copyrighting. Membership was limited to persons of recognized standing in the literary or artistic professions. It was divided in 1922 into five departments: The American Dramatists; the Authors' Guild; The Authors' League Fellowship; The Artists' Guild; and the Screen Writers' Guild. Throughout the decade the League supplied confidential information to its members regarding managers, producers, etc. In 1919 it launched a world wide propaganda on behalf of American literature to raise the standard of literary criticism and to secure for American books the attention due them. The constitution of the league was revised in 1920 in regard to membership, dues, and the formation of guilds. Presidents during the 10 years were: Winston Churchill, Rex Beach, Owen Davis, Jesse Lynch Williams, and Ellis Parker Butler.

AYLMER, SIR FENTON JOHN (1862-).

A British general. He joined the army in 1880. He gained distinction as an officer in Burma, India, and China, and in 1912 was made adjutant-general at Simla. In 1915 he was promoted to the rank of lieutenant-general and led the forces in Mesopotamia for the relief of Kut-el-Amara. The attack on the Turks failed; he was taken prisoner in April, 1916, and was exchanged in September. See **WAR IN EUROPE**, *Turkish Front*.

AYRES, LOUIS (1874-).

An American architect, born at Bergen Point, N. J. He graduated from Rutgers College in 1896, entered the offices of McKim, Mead and White, and in 1910 went to the firm of York and Sawyer, prominent as the firm architects of the Guarantee Trust Company Building, Postal Life Building, Broadway Savings Bank, and Rockefeller Hospital (New York), as well as the Riggs Bank and the American Security and Trust Company (Washington, D. C.). He was appointed architect for the Federal Reserve Bank, Bowers Savings Bank Building, Greenwich Savings Bank (New York), First National Bank (Boston), etc. He was a member of the Federal Fine Arts Commission for 1921-25.

AZERBAIJAN, SOVIET REPUBLIC OF.

One of the three Transcaucasian republics, affiliated with the union of Socialist Soviet Republics that emerged in October, 1917; made up of the former Russian governments of Baku and Elisavetpol, and situated on the land-bridge which links Asia with Europe. The republic derives its name from the Persian Azerbaijan to which it belonged up to 1813, when Russia acquired it. Geographically it lies in

the basin of two great Caucasian rivers, the Kuru and the Aras, and is enclosed by the Caspian Sea, the Caucasus, and the highlands of Armenia and Persian Azerbaijan. Around its chief city, Baku, is to be found oil, and in this single fact lies the prominence of an otherwise unimportant state. Within its boundaries is an area of 33,616 square miles, and a population, according to Russian statistics, of 2,096,973. Seventy-five per cent of the people are Moslems of Tartar and Turk stock, and almost the whole of the remainder are Armenians. The few Russians and Europeans in the state are to be found in the Baku district.

Industry. The natives are a pastoral people. Cattle- and sheep-herding is their leading activity. Lack of communications and absence of a real community life made for ignorance and superstition, and backwardness was further fostered by unfamiliarity with the western world. The city of Baku, with an estimated population of 250,000, was the centre of great oil wells and before the War was the most prolific single district in the world and almost the only source of Russia's petroleum output. Lines of communication and trade centred here, making Baku the focal point of the whole Transcaucasian isthmus. The city was in direct communication by rail and water with Europe and Asia, particularly because it was the eastern terminus of that Transcaucasian railway which ended in the West at Batum, Georgia. Another tie that knitted the two cities together into a single economic unit was the pipe line that tapped the Baku oil fields. The separation of these two cities from 1917 to 1923 as a result of political upheavals was really the nucleus of the Transcaucasian problem. Besides the petroleum some developments were made in Azerbaijan in cotton culture, stock-raising, silk, cereals, and fisheries.

History. The story of Azerbaijan is intimately connected with that of the Russian Republic. In March, 1917, the Russian Republic was established; in September, in concert with Georgia and Armenia, Azerbaijan set up an autonomous government for Transcaucasia. The seat of this federal republic was established at Tiflis and a parliament or *seim* of 132 members organized. The republic had a brief and stormy career, for profound divergences of faith and sympathy impeded attempts at a mutual understanding. The Georgians and Armenians were Christians and looked to Europe for aid; the Tatars of Azerbaijan were Musulmans and regarded Turkey as their natural ally. The invasion of Transcaucasia by Turkey in the spring of 1918 to secure the territories allotted it under the Brest-Litovsk treaty of Mar. 3, 1918, caused serious dissension in the Republic, for the Azerbaijani refused to take arms against their kinsmen. Other forces of disintegration were also at work. A Bolshevik government had established itself at Baku, and aided by the Armenian traders in the city, succeeded in seriously hampering the activities of the Azerbaijan government set up provisionally at Elisavetpol. In March, 1918, the Tatar Moslems were compelled to flee from Baku as a result of serious disorders in which thousands were slain. On Mar. 17, 1918, an Azerbaijan attack on Baku was repulsed, compelling the Tatars to turn to their co-religionists, the Turks, for aid. This definite alliance with the Turks on the part of Azerbaijan brought about

the fall of the federal republic, which was dissolved on May 26, 1918. Great Britain had watched all these movements with alarm. The victories of the Turks, together with the threat to the East that their advances implied, compelled the despatch of a British force to the aid of the Russians and Armenians beleaguered in Baku. But the counter-attack of the Turks could not be withstood, the British were compelled to take to their ships; and Baku fell on Sept. 14, 1918. The armistice of October 30 between Turkey and the Allies cleared Transcaucasia of Turkish troops, and a British division soon took possession. It seems to have been the intention of the British to maintain a permanent sphere of control in Transcaucasia. But this policy depended on French successes in the Ukraine, and when the French met with hostility in Odessa and were compelled to withdraw, the British position in Transcaucasia was correspondingly weakened. During July and August, 1919, the British withdrew.

When the Peace Conference assembled early in 1919, Azerbaijan attempted to have its boundary question considered. This matter was compelled to wait on the completion of the Turkish treaty, and nothing was settled. In January, 1920, recognition was accorded by Great Britain to Azerbaijan and its sister-republics, Armenia and Georgia. A little later the three states exchanged treaties in which they promised to safeguard one another's independence and to permit unimpeded intercourse between Batum and Baku. This show of external independence was brief. The defeat of Denikin and the understanding that was reached between the Russians and the Turkish Nationalists on Mar. 16, 1920, once more left unhindered the Russian advance into Transcaucasia. On Apr. 28, 1920, a Russian army entered Baku without opposition. A rising of local Bolsheviks turned out the Equality Party then in power and a Soviet government was established, patterned after and in complete sympathy with the Moscow government. Local disorders as a result of the concentration of Russian activities exclusively in Poland during the fall of 1920 caused much bloodshed. Bolshevik sympathizers were attacked by Tatars at Elisavetpol, and Bolsheviks and Armenians retaliated with the massacre of some 15,000 Tatars of all ages. In September, 1920, Azerbaijan signed a series of treaties with Soviet Russia consenting to unification of the military organization, financial and economic control, and foreign relations of the two countries; Azerbaijan became a dependent state with a very restricted local autonomy. In the fall of 1920 the Russian Bolsheviks brought about the downfall of the national governments of Armenia and Georgia, and in the spring of 1921 soviet governments were set up in these countries. Once more Azerbaijan, Armenia, and Georgia were bound together in a federal republic of Transcaucasia, but the federation was now in vassalage to Soviet Russia. Thus, in effect, Russia was once more in control of her old Transcaucasian provinces and dominated their economic and political life as before the events of 1917. This influence was given the stamp of legality by the completion of the important treaty of Dec. 30, 1922 (see RUSSIA) at Moscow; all the Russian soviet republics were signatories to this. By it the governments of Russia, the Ukraine, White Russia, Georgia, Ar-

menia, Azerbaijan, Bokhara, and Khiya, substituted for their bi-lateral treaties a federal state, called the Union of Socialist and Soviet Republics. Under the treaty a centralized control for the army, navy, foreign affairs, trade, finances, economic resources and relations, etc., was established, and a Central Executive Committee for the Allies was at once created. This body comprised 270 representatives from Russia, 68 from the Ukraine, 7 from White Rus

sia, and 26 from the Transcaucasian states. As far as Azerbaijan was concerned the Union meant, economically, the establishment of relations once more with the port of Batum, and politically, the definite passing of Azerbaijan, as an independent state after a turbulent history of less than six years' duration. See RUSSIA.

AZORIN (1876-). See MARTINEZ RUIZ, José.

B

BABBITT, IRVING (1865-). An American scholar and critic (see Vol. II). His *Rousseau and Romanticism* (1919), one of the outstanding critical productions of the time, synthesized the attitude toward life and letters which he had expressed in previous works. His brilliant attack on the fetish of naturalism in science, philosophy, and literature, and his insistence on the classical formula of moderation and form, came with particular timeliness, when the romantic cult seemed to reach its apogee. His work had something prophetic in it, for the swing toward classicism in France and England became more and more marked. In the United States he was more persistently romanticist because of the absence of a humanistic tradition and because of the firm entrenchment of pragmatism. Mr. Babbitt also published occasional papers in reviews and periodicals.

BABCOCK, BERNIE (SMADE) (1868-). An American author, born at Unionville, Ohio. She was a member of the staff of the *Arkansas Democrat* and later owned and edited *The Arkansas Sketch Book*, the first venture of its kind in her native State. She wrote *Mammy*, a drama read at Chautauqua and on lyceum circuits. She is also the author of *Yesterday and To-day in Arkansas* (1917), *The Coming of the King* (1921), *The Soul of Ann Rutledge*, *Abraham Lincoln's Romance* (1919), and *The Soul of Abraham Lincoln* (1923).

BABCOCK, SAMUEL GAVITT (1851-). American bishop in the Protestant Episcopal Church. He graduated from the Episcopal Theological School at Cambridge, Mass., in 1891. After holding pastorates in Rhode Island and Massachusetts he was archdeacon of Massachusetts from 1903 to 1913, when he was elected bishop.

BABINSKI, JULES (1855-). A distinguished French neurologist, pupil and successor of Charcot. Born in Paris, he graduated in medicine from the University in 1885. He discovered several valuable diagnostic signs in connection with neurological practice; two of these are in daily use among neurologists. The so-called "great toe" or "first Babinski" reflex was described in 1896-97 and the "second toe sign" in 1903. He was Charcot's chief of clinic in the Salpêtrière and Pitié Hospitals, and during the War, he had charge of many traumatic neurological cases at the latter institution. He was professor of neurology in the University of Paris. Babinski has written over 200 papers on nervous affections. With Froment he published *Hysteropithiatisme en Neurologie de Guerre*, 1917. This work was translated into English by Sir H. Rolleston in 1918.

BACHELIN, HENRI (1879-). A French

novelist, born at Lormes (Nièvre), France. He is especially noted for his novels describing Morvan, the section of France with which he was best acquainted. In 1918 he was awarded the *Vie Heureuse* prize. His works include *Pas comme les Autres* (1906), *Les Manigants* (1907), *Horizons et Cœurs du Morvan* (1909), *Jules Renard et Son Œuvre* (1909), *Robes Noires* (1910), *Juliette la Jolie* (1912), *Sous d'Humiles Toits*, short stories (1913), *L'Héritage* (1914), *La Renaissance du Livre* (1917), *L'Éclaircie* (1918), *Le Serviteur* (1918), *Les Rustres* (1922), and *Le Chant du Coq* (1922-23).

BACHELLER, IRVING (1859-). An American author (see Vol. II). He published *Marryers* (1914); *The Light in the Clearing* (1917); *Keeping Up with Williams* (1918); *A Man for the Ages* (1919); and *The Prodigal Village* (1920).

BACON, FRANK (1864-1922). An American actor, born at Marysville, Cal. He was educated in the public schools of San José, and after experimenting in journalism and photography he made his first appearance on the stage at the Garden Theatre, San José, Cal., in 1890 in the melodrama *Ten Nights in a Bar-Room*. His first appearance on the New York stage was at the Gaiety Theatre, New York, beginning in *Alabama, Puddin' Head Wilson, Me and Grant, The Cinderella Man, The Fortune Hunter*, etc. His most popular character play was *Lightnin'*, written by himself and produced with extraordinary success for three consecutive years at the Gaiety Theatre, New York, beginning in 1918.

BACON, RAYMOND FOSS (1880-). An American chemist, born at Muncie, Ind. He was graduated in 1899 at DePauw University. He then received a fellowship at Chicago. He taught chemistry at Vincennes University, but subsequent to obtaining his doctor's degree he took up the commercial practice of chemistry in Chicago. In 1905 he went to the Philippines as chemist to the Bureau of Science and five years later accepted a similar appointment in the Bureau of Chemistry in Washington. He was director of the Mellon Institute in Pittsburgh, 1914-21; in 1921 he entered commercial practice in New York City. During the War he served in the Chemical Warfare Service with the rank of colonel and was also connected with the Naval Construction Board.

BADEN, FREE STATE OF. Formerly a grand duchy, now a republic, in Southwestern Germany. Its area is 5819 square miles; its population in 1919, 2,208,503 (the 1910 census gave Baden 2,142,833). The capital, Karlsruhe, had, according to the census of 1919, 135,952. The largest cities include: Mannheim (229,576), Freiburg (87,946), Heidelberg (60,831), and

Baden (25,444). No important changes have appeared in the activities of the population. Wheat, barley, rye, tobacco, hemp, and various root crops are cultivated. The vine culture yielded about 6,000,000 gallons of wine in 1921. The manufactures have included tiles, cigars, jewelry, machinery, musical instruments, chemicals, hats, paper, leather, and brushes.

Up to the revolution of 1918, Baden was ruled by a hereditary monarch, the Grand Duke, with the aid of an election diet. The country, because of an alliance of the Liberal parties and the Social Democrats, and also because of its long liberal tradition, was regarded as one of the most happily administered in all Europe. But the downfall of the Hohenzollern family dragged with it the reigning house of Baden and the Grand Duke abdicated on Nov. 22, 1918. On Jan. 15, 1919, a national assembly, which had been elected on a basis of universal suffrage, met for the preparation of a new constitution. On May 21, 1919, the new constitution was promulgated, the first such document to emerge in revolutionary Germany. It abolished all privilege of birth, religion, and caste; bestowed full legal rights on women; recognized the right of workers, including civil servants, to combine; and granted the suffrage to all men and women over 20. The sovereign power has been vested in a single-chamber diet (Landtag), which chooses the ministry of eight, and, from their number, one to act as minister-president and president of the state. Through the exercise of the initiative, the diet may be dissolved at any time. Baden is a member of the German Federated Republic or Reich and has three members in the Reichsrat or Imperial Council.

BAEKELAND, LEO HENDRIK (1863-). A Belgian-American chemist (see VOL. II). In 1914 he was awarded the Chandler Medal by Columbia University, in 1915 the Grand Prize at the Panama-Pacific Exposition, and in 1916 the Perkin Medal.

BAEUMER, GERTRUD (1873-). A philologist, teacher, lecturer and active worker in the woman's movement of Germany. She was born in Berlin, where she studied at the university. She is the author of some philological works, *Die Soziale Idee und die Weltanschauungen des Neunzehnten Jahrhunderts* and *Handbuch der Frauenfrage* (in collaboration with Helene Lange). She edited *Die Hilfe* and *Die Frau*, was elected member of the Diet (1918) and became councillor in the Cabinet of the Interior.

BAFFIN LAND. For three centuries this was a land of mystery. Its boundary and extent were unknown, and authorities differed as to whether it was an island or a peninsula. Macmillan added to our knowledge, but it remained for the governmental expedition of Canada in 1923 to solve the geographic problem. It is by far the largest island in the Parry archipelago, extending northward 1200 miles from latitude 62°N. to 74°N. Its estimated area is 211,000 square miles, five times the size of Cuba. Canada perfected its claim to the island by the establishment of a station of mounted police in Ponds Inlet, where the Hudson Bay Company had a factor trading with the inhabitants of a permanent village of about a hundred natives at that point. There were several different tribes of Eskimos living by hunting and fishing in the interior. In the

southern district are two large lakes, comparable in size to Lake Ontario. Outcroppings of iron and coal were noted, and the latter was mined to some extent. Explorations were being made for gold and other valuable minerals.

BAGDAD. See MESOPOTAMIA; WAR IN EUROPE, *Turkish Front*.

BAGDAD RAILWAY. The Asiatic link, a line 2500 miles long, of the Great "Berlin to Bagdad" Railway, which was intended to further German penetration into the Near East. It was one of the most important "stakes of diplomacy" and as such may be regarded as one of the factors that contributed to bring about the War of 1914; indeed, the frustration of the German "Berlin-Byzantium-Bagdad" plan was publicly declared by Allied and American leaders during the War to be a vital issue of the world conflict. Before the inception of the Bagdad Railway scheme, Central Europe had been connected with Constantinople by the Oriental Railway; and in the very year (1888) in which the first through train ran across the Balkans to the Ottoman Capital, a German syndicate headed by the *Deutsche Bank* obtained a concession to extend the Haidar Pasha-Ismid Railway as far as Angora, in the interior of Anatolia. As soon as this line was opened (in 1893), the same syndicate, operating through the Anatolian Railway Company, obtained permission to build a branch to Konia (completed 1896). Now a wider vista of economic-political penetration was unfolded to the ambitious German engineers and financiers; they now proposed to push the railway from Konia across the frowning Taurus mountains, through Cilicia and northern Syria, across the desert to Mosul on the Tigris, thence to Bagdad, and on to the Persian Gulf. Negotiations for this project, begun in the nineties, culminated in 1903 in the formal grant of the Bagdad Railway Concession by the Ottoman government to an Ottoman corporation, the Bagdad Railway Company controlled by German banks. Russia immediately objected; England and France, declining an offer of shares in the enterprise, raised obstacles in the way of the German advance. Nevertheless, the work of construction was begun, and section after section was completed; yet, because of diplomatic as well as engineering difficulties, the line was unfinished when the War began. Great gaps were still unbridged in northern Mesopotamia and in the Amanus mountains. Turkey's entry into the War was largely due to the politico-economic grip which the railway project had given Germany on the Ottoman Empire. During the conflict, Turks and Germans labored in frantic haste to complete the line, for military purposes. The celebrated Bagdhé tunnel was pierced in 1915, a narrow-gauge track was laid to Aleppo, and by the Armistice all but about 325 miles between Nisibin and Bagdad, and the sector below Bagdad, remained unfinished. But not for Germany were the fruits of the enterprise reserved. The Treaty of Versailles (1919) cancelled all former German rights in the Bagdad Railway; the Treaty of Sèvres and the accompanying secret Anglo-French-Italian agreement (1920) provided that Turkey should appropriate the Anatolian and Bagdad Railways, and transfer them to a Franco-British-Italian corporation. France, stealing a march on Britain by the Franco-Turkish Treaty of Angora (1921), obtained for a French syndicate (the Cilician-

Syrian Railway Company) the concession for the middle section between Bozanti and Nisibin (i.e. between Cilicia and the Tigris) in 1922. The southeastern sections, from Samarra to Bagdad and thence to Basra, having been completed by the British army of occupation, were, of course, under British control. The north-western or Anatolian section, from Haidar Pasha to the Cilician Gates, remained provisionally in Turkish hands, pending fulfillment of the Sevres treaty or some other arrangement. It was a delicate problem, because the stockholders of the Bagdad Railway Company, which was to be expropriated, were by no means all Germans; about 30 per cent of the stock was owned by French investors, and a large block was held by the Swiss *Bank für orientalischen Eisenbahnen*, to which the *Deutsche Bank* had transferred its holdings. By purchasing a controlling interest in this Swiss bank, in May, 1923, British financiers hoped to obtain indirectly a dominating interest in the railway. A little later, a British financial group represented by Mr. Huguenin was reported to be negotiating with the Turkish government for a lease of the Anatolian Railway. Such negotiations, of course, were pursued largely behind the scenes of public diplomacy, and could not be traced with certainty, nor had the ownership of the Anatolian-Bagdad system been definitely determined by 1924; but of one point there could be no doubt, that the magnificently ambitious German scheme, which had so profoundly stimulated the hopes of German imperialists and no less deeply stirred the enmity of Entente statesmen before the War, was no longer to be a German enterprise.

BAGLEY, WILLIAM CHANDLER (1874-). American university professor born at Detroit, Mich. He was educated at the Michigan Agricultural College, the University of Wisconsin, and Cornell University. He taught in the public schools and was professor of education in the University of Illinois and Teachers' College, Columbia University. He was president of the National Society for Study of Education and the Society of College Teachers of Education. During the War he edited *The National School Service*. Among his published works are *Educational Values* (New York, 1911); *The History of the American People*, with Charles A. Beard (New York, 1919); *A First Book in American History*, with Charles A. Beard (New York, 1920); *The Nation and the Schools*, with John A. Keith (New York, 1920); and *Our Old World Background*, with Charles A. Beard (New York, 1922).

BAHAMAS. A British colony north of the West Indies consisting of 29 islands, 661 islets, and over 3000 reefs. Only 20 islands of this whole group are inhabited. The principal islands are: New Providence, which contains the capital, Nassau (13,554); Abaco (4463); Grand Bahama (1824); San Salvador (5072); Long Island (4150); Eleuthra (6533); Exuma (3465); and Andros Island (7545). The planting of sisal, the growing of vegetables, and the sponge fisheries continued to be the leading industries, while fruit culture increased rapidly because of the establishment of canning factories. The imports for 1922 were valued at £1,963,152 (a gain of 386 per cent over 1913), and the exports at £1,827,735 (a gain of 599 per cent over 1913). In 1922, 721,846 tons of shipping entered and 718,110 tons cleared the

ports of the islands. In 1922, the share of the United States in Bahamas imports was 60 per cent, and of their exports, 8 per cent, carried for the most part in American bottoms. A large proportion of the illicit alcoholic traffic carried on with the United States originated in the Bahamas, the city of Nassau devoting itself to a large extent to this activity.

BAHREIN. See ARABIA.

BAIKO, ONOYE (?-). A Japanese actor of the Imperial Theatre in Tokyo whose delicacy and charm as an interpreter of female rôles have won him great favor. He is a member of the company which presents classical *Nabuki* drama. Baiko and his associates perform on a stage whose basic fictions are different from those of the American theatre. The orthodox Japanese stage makes little effort to conceal its operation.

BAILEY, BENJAMIN FRANKLIN (1875-). American electrical engineer, born at Sheridan, Mich. He studied electrical engineering at the University of Michigan and later held the positions of chief engineer of the Fairbanks-Morse Electrical Manufacturing Company and Howell Electrical Motor Company, director of Bailey Electrical Company, and vice-president and director of the Fremont Motor Corporation. He is the author of several books on electrical engineering, including *Principles of Dynamo-electric Machinery* (1915). He became professor of electrical engineering at the University of Michigan in 1913.

BAILEY, CAROLYN SHERWIN (1877-). An American author of children's stories, born at Hoosick Falls, N. Y. She graduated from Teachers' College, Columbia University, in 1896. She has contributed to the *Ladies' Home Journal* and other magazines, and published volumes of stories for children, methods of story telling, methods of teaching children, etc., which include *Boys and Girls of Colonial Days* (1917), *Broad Stripes and Bright Stars* (1919); *Flint; The Story of a Trail* (1922); and *Friendly Tales* (1923). She wrote *For the Children's Hour* (1906) in collaboration.

BAILEY, CHARLES JUSTIN (1859-). An American soldier, born in Tamaqua, Pa. He graduated from the United States Military Academy in 1880 and in the same year was appointed second lieutenant. He was promoted through the various grades and became colonel in 1911 and brigadier-general in 1913. On Aug 5, 1917, he was appointed major general of the National Army. He commanded the Philippine Department in 1918 and in the same year was made commander of the 81st Division of the National Army, which he commanded in France in 1918-19. In the latter year he was appointed commander of the Middle Atlantic Coast Artillery District, and in 1921, commander of the Third Corps Area. He was awarded the D. S. M., the Order of Leopold (Belgium), the Croix de Guerre with palm, and was an officer of the Legion of Honor.

BAILEY, PEARCE (1865-1922). An American neurologist and psychiatrist, educated at Princeton and Columbia Universities. He became a consultant in several New York hospitals and with Collins and Fraenkel founded the Neurological Institute. He was also appointed an associate professor of neurology in Columbia. On the entry of the United States into the War, he was appointed chief of the division of neurology and psychiatry in the

United States army with the rank of colonel. He perfected a system for weeding out defectives which is said to have been used as a model by the Allies. His major literary efforts comprise a translation of Golobievski's *Atlas and Epitome of Diseases Caused by Accident* (1900) and a monograph *Accident and Injury; Relation to the Nervous System* (1906), which he later expanded into *Diseases of the Nervous System Resulting from Accident and Injury*, a valuable work for the medical world. At the time of his death, Dr. Bailey was chairman of the New York State Committee for Mental Defectives.

BAILEY, VERNON HOWE (1874-). An American artist, born at Camden, N. J., who studied at the Pennsylvania Museum School of Art and the Pennsylvania Academy of Fine Arts. Mr. Bailey's special subject is city streets in Europe and America. The best known of his drawings are his sketches in pencil of London. Bailey was the first artist privileged by the United States government on the declaration of war to make drawings of navy yards, munition factories, and other centres of war work. These drawings appeared in exhibitions and were published in the leading magazines throughout the country. The Hispanic Society has a collection of 150 drawings which Mr. Bailey made of Spain, and the Musée de la Guerre of France contains a collection of lithographs of American war subjects. Besides his work as a newspaper artist in London and America Mr. Bailey illustrated many books.

BAIN, HARRY FOSTER (1871-). An American geologist, born at Seymour, Ind. He was educated at Moores Hill College, Johns Hopkins, and the University of Chicago. Meanwhile he became connected with the Iowa Geological Survey in 1893 and remained in this position until 1901, when he entered the United States Geological Survey, with which he served for two years. From 1905 to 1911 he was State geologist of Illinois. In 1918 he returned to the government service as assistant director of The Bureau of Mines and in 1920 succeeded to the directorship. He was editor of the *Mining and Scientific Press*, 1909-15, and in 1915-16 he edited the *London Mining Magazine*. Dr. Bain gave courses of lectures on economic geology at the University of Iowa in 1897 and at the University of Chicago in 1899 and 1902-3.

BAINBRIDGE, WILLIAM SEAMAN (1870-). An American surgeon and gynecologist born at Providence, R. I. He studied at the College of Physicians and Surgeons of Columbia University and at various hospitals in New York City and abroad. He has been a prolific writer on surgical subjects in many fields, notably intestinal stasis and cancer. He became a professor at the New York Polyclinic Medical School and Hospital in 1906. Before the entry of the United States into the War he was United States medical observer with the Allied armies and later was attached to the Surgeon General's office to report his findings. After the entry of the United States into the War he functioned as naval surgeon on vessels and at naval base hospitals and was subsequently commissioned commander of the United States Medical Corps. He is the author of *The Cancer Problem* (1914), re-issued in French in 1922; *Life's Day* (1909), a work on personal

hygiene; and *Report of Medical and Surgical Developments of the War* (Government Printing Office, 1919).

BAINSIZZA, PLATEAU. See **WAR IN EUROPE, Italian Front.**

BAIRNSFATHER, BRUCE (1887-). An English humorist born at Murree, India, and educated at the United Services College, Westward Ho. He studied to be an engineer but in 1914 rejoined the Royal Warwickshire Regiment and served in France until 1916, when he received a War Office appointment. His humorous black and white sketches of life in the trenches which appeared in *Bystander* made Bairnsfather's reputation, and his play *The Better 'Ole*, which scored a great success in 1917, was based on the adventures of the "Old Bill" of these sketches. *Fragments of France* contains many of his drawings. He also produced *Bullets and Bullets* (1916) and *From Mud to Mufti* (1919). In 1919 he started *Fragments*, a weekly comic paper.

BAKER, GEORGE BARR (1870-). An American editor, born at Wyandotte, Mich. He began as reporter on the *Detroit Tribune* (1895-96) and was subsequently art critic, foreign correspondent, etc., for leading newspapers and magazines. He was American correspondent of the *London Daily Express*, 1904-05. Later he was associate editor of *Everybody's Magazine* (1907-10) and literary editor of the *Delineator* (1911-14). Through the Spanish-American War he was ship's writer for the U.S.S. *Yosemite*, and during the European War he held the important positions of secretary of the Commission for Relief in Belgium, director of the American Relief Administration, Commander of the United States Naval Reserve Force, etc. He wrote of *Mother's Geese: a New Brood*, in collaboration (New York, 1906).

BAKER, HORACE (? -). An American railway official, born in Missouri, where he was educated in the public schools. He worked up from subordinate positions in various railway companies and became in 1917 general manager of the Cincinnati, New Orleans and Texas Pacific Railway and the Alabama Great Southern Railroad System (lines west). In 1920 he was a member of the Railroad Board of Adjustment and of the United States Railroad Labor Board.

BAKER, HUGH POTTER (1878-). An American forester, born at St. Croix Falls, Wis. He graduated from the Michigan Agricultural College in 1901 and took post-graduate courses in forestry at Yale. He also studied at the University of Munich. For 10 years he was in the United States Forest Service in Idaho, Wyoming, New Mexico, and other western States. He became professor of forestry in the Iowa State College in 1904 and filled the same chair at Pennsylvania State College, 1907-12. He was dean and professor of silviculture at the New York State College of Forestry, 1912-20, and in 1920 he became executive secretary of the American Paper and Pulp Association. During the War he served with the 46th Infantry and was a member of the General Staff.

BAKER, (MRS.) KARLE WILSON (1878-). An American poet and author, born at Little Rock, Ark., and educated at the University of Chicago. In spite of the frequent mordant bits, her poems have visions of real beauty. Under the pseudonym of "Charlotte Wilson,"

she was co-author of *Women and Prisons* (1912), published in London by the Fabian Society. She has contributed fiction and poetry to *Harpers*, *Atlantic Monthly*, *Yale Review*, *The Century*, etc., and is the author of *Blue Smoke*, poems (1919), *The Garden of the Plynck* (1920), *The Burning Bush* (1922), etc.

BAKER, NEWTON DIEHL (1871-). An American lawyer and public official, born in Martinsburg, W. Va. He graduated from Johns Hopkins University in 1892 and from the law department of Washington and Lee University in 1894. He served as private secretary to Postmaster General Wilson, 1896-97, and in the latter year began the practice of law at Martinsburg, W. Va. He removed to Cleveland, Ohio, and from 1902 to 1912 was solicitor for that city. He was elected mayor in 1912 and was reelected in 1914. His work as an efficient administrative officer attracted wide attention, and in 1916 he was appointed Secretary of War by President Wilson. He was in charge of this most important branch of the government during the War, and although his administration was severely criticized, it was generally conceded that on the whole his conduct of the office was marked by zeal and by absolute devotion to its duties. He served until Mar. 4, 1921. In that year he was commissioned colonel of the O. R. C. On the conclusion of his official service, he resumed the practice of law in Cleveland. He was a zealous advocate of the League of Nations, and at the Democratic national convention of 1924, he made an impassioned appeal for the inclusion of the plank favoring the League in the Democratic platform. This move was defeated.

BAKER, P. BRYANT (1881-). An English sculptor, born at London. He studied at the London Royal Academy of Arts. Baker came to the United States in 1915 and served in the army, 1918-19. His work includes a statue of King Edward VII at Huddersfield, Yorkshire; a memorial to Archdeacon Henry Robeson in Tewkesbury Abbey, the Rt. Hon. Percy Illingworth Memorial in London, a marble bust of King Edward VII, executed for Queen Alexandra, and a portrait of Prince Olav, for the Queen of Norway. An idealistic imagination is evident in his "Eros" (Manchester) and "Mnemosyne" (Hull City Art Galleries). As a student he attracted much attention with the four figure group, "The Entomment," which won a first prize at the Academy. He has made portrait busts of President Wilson, Gen. J. J. Pershing, Chief Justice William H. Taft, and Theodore Roosevelt. His work has been exhibited at the Royal Academy London, the Paris Salon, the Corcoran Art Gallery in Washington and at various important galleries in the United States.

BAKER, RAY STANNARD (1870-). American author and publicist (see Vol. II). After the War, Mr. Baker was prominent as director of the press bureau of the American Peace Delegation in Paris. In this capacity he passed on all the news concerning the peace proceedings which emanated from official sources for home consumption. Continuing his prolific writing, he published books in many genres. Under the pen-name of "David Grayson" he wrote a series of rural studies which in their idyllic charm struck a rather unusual note in American literature. Their tranquillity and

kindliness had the flavor of Vergil's *Georgics*. These sketches included *Adventures in Contentment* (1907), *Adventures in Friendship* (1910), *The Friendly Road* (1913), *Great Possessions* (1917), and the novel *Hempfield* (1915). As a result of his peace activities, he wrote *What Wilson Did at Paris* (1919), and *Woodrow Wilson and World Settlement* (1922). The latter was a full account accompanied by official documents and had as its purpose the vindication of President Wilson's attitude.

BAKU. See AZERBAIJAN.

BALCH, EDWIN SWIFT (1856-1927). An American writer on the Antarctic, glaciers, etc. He was born at Philadelphia and graduated from Harvard University. After studying in the law office of William Henry Rawle, he was admitted to the Philadelphia bar in 1882. Besides contributing to periodicals, he has written *Antarctica* (1902), *Comparative Art* (1906) *The North Pole and Bradley Land* (1913), *Mt McKinley and Mountain Climbers' Proofs* (1914), and *Arts of the World* (1920), etc.

BALDWIN, JAMES MARK (1861-). An American philosopher and psychologist (see Vol. II). During the War he was active in behalf of the Allies' cause and published addresses pleading for American participation. *American Neutrality, Its Cause and Cure* (1916) and *France and the War* (1916) are two such collections. *The Superstate and the Eternal Values* was the Spencer memorial lecture for 1916. *A Genetic Theory of Reality*, presented as the culmination of his previous studies in genetic logic, is the only comprehensive philosophic work he published after 1914. Professor Baldwin's works have been translated into French and have been well received by the philosophic public of France.

BALDWIN, LEWIS WARRINGTON (1875-). An American railway official, born at Waterbury, Md., and educated at St. John's College (Annapolis, Md.) and at Lehigh University. He began his career in the engineering department of the Illinois Central Railroad in 1896. From 1906 to 1915 he held various positions with the Illinois Central and Yazoo and Missouri Valley Railways, finally becoming their general superintendent. He was successively general manager and vice-president of the Central of Georgia Railway, 1915-18, and in 1918 he became assistant regional director of the United States Railroad Administration for the southern region. He held a similar position in the Allegheny region, 1918-19, and became director in 1919-20. In the latter year he was also made vice-president in charge of the operating department of the Illinois Central Railroad.

BALDWIN, STANLEY (1867-). A prime minister of Great Britain, born Aug. 3, 1867, and educated at Harrow and Cambridge. He entered Parliament in 1908. Business absorbed most of his attention for some years, and it was not until the break-up of the Lloyd George coalition in October, 1922, when he was made financial secretary to the treasury, and later president of the Board of Trade, that he caused any particular stir in politics. His training in trade and finance stood him in good stead, and his great ability in these fields became widely recognized. In the Bonar Law government he was made Chancellor of the Exchequer, and did much to increase Great Bri-

tain's prestige abroad. In January, 1923, he came to the United States to arrange for the payment of the British war debt. After a month of successful accomplishment he returned home to England. On April 16 he introduced his first budget, which showed a surplus of \$500,000,000, most of it due to drastic economy. Soon after Easter, Bonar Law lost the use of his voice, and Baldwin acted as his deputy and spoke for him on many occasions. When Bonar Law resigned in May, 1923, Baldwin became prime minister. Baldwin and his supporters believed that the protection of home industries was the sovereign cure for unemployment, but he was bound by his late chief's pledge to let tariff reform alone. He appealed to the country, and an election was held on December 6. The vote was against protection, and by the time Parliament met on Jan. 8, 1924, it was expected that the Baldwin government would be given a vote of censure. The anticipated vote occurred on January 21, and on Mr. Baldwin's resignation the next day, Ramsay MacDonald was summoned to Buckingham Palace and asked to form a new cabinet.

BALDWIN, THOMAS SCOTT (1854-). An aeronaut born in Merrien County, Mo. His flying experience extended over a 46-year period, from 1875 to 1921. He is best known as the originator of parachutes and as the first to descend from a balloon in a parachute in the United States (at San Francisco in 1885). He delivered the first airship to the signal corps of the United States army. During the War he was chief of the army balloon inspection and production.

BALFOUR, ARTHUR JAMES, FIRST EARL OF (1848-). A British statesman and former prime minister (see VOL. II). With other Unionist leaders he discarded all party differences on the outbreak of the War and joined Mr. Asquith's first Coalition cabinet of 1915 with the portfolio of First Lord of the Admiralty. In this office his work met the uncompromising criticism of Winston Churchill, whom he had displaced, but his dignified deportment and excellent reports earned public confidence. In his administration the battle of Jutland was fought; he was responsible for the appointment of Sir John Jellicoe as First Sea Lord and Sir David Beatty as commander of the sea forces. With the accession of Lloyd George in December, 1916, Mr. Balfour was transferred to the Foreign Office, where it was felt that his pleasing address could be of greatest aid in gaining the sympathies of the United States. In 1917 he came to the United States as the head of the British Mission and served as an important element in fusing the purposes of the two nations. In the same year his statement to the effect that Great Britain would support the creation of Palestine as a homeland for the Jews attracted the support of Jewry the world over and was regarded as proof of English sincerity in championing the cause of small nations. In the years that followed, Mr. Balfour accepted comparatively unimportant posts cheerfully. He attended the Peace Conference as a British representative and watched the Big Four write the peace. In 1919 he resigned his Foreign Secretaryship to accept the less significant post of First President of the Council. In 1920 he represented his country at the first Assembly of the League of Nations, and

in 1921 he once more came to America as his government's spokesman at the Washington Disarmament Conference. His disinterested services were fittingly recognized; the Order of Merit was conferred on him in 1916, and in 1919 the chancellorship of Cambridge University. Finally in 1922 he was created first Earl of Balfour and Viscount Traprain of Wittingehame, and thus took his seat in the House of Lords after serving in the Commons for almost 50 years. He published, after 1914, *Theism and Humanism* (1915) and *Essays, Speculative and Political* (1920).

BALFOUR, SIR ISAAC BAYLEY (1853-1922). A Scottish botanist, born at Edinburgh (see VOL. II). From 1888 to the year of his death he was King's Botanist in Scotland, Regius Keeper of the Royal Botanic Garden at Edinburgh, and professor of botany at the University of Edinburgh.

BALFOUR DECLARATION. See PALESTINE.

BALIEV, NIKITA FYODOROVITCH (?-). A Russian actor and theatrical producer whose reputation in America was due to the success of his *Théâtre de la Chauve-Souris*. This "bat theatre" was in origin nothing else than a "cabaret carried out with finesse, fantasy and fancy." In Baliev's establishment the authors and artists of the Moscow Art Theatre gathered for amusement and relaxation. The Revolution came and with it poverty: Baliev went to Paris with his troupe. First Paris, in 1920, then London, and later New York saw in his productions the "enigmatic smiling Russia that is of no time and no age." Baliev is a master showman who knows how to make the most of his limitations. Even his broken English is capitalized in his stage presence.

BALL, ELMER DARWIN (1870-). An American entomologist (see VOL. II). He was State entomologist of Wisconsin (1916-18) and professor of zoölogy and entomology at the Iowa State College and State entomologist of Iowa (1918-21). In 1921, Professor Ball became director of scientific work in the United States Department of Agriculture.

BALLANCE, SIR CHARLES ALFRED (?-). A distinguished British surgeon who has specialized in cranial and vascular surgery. He received his medical degree from the University of London in 1881. Among his appointments are those of surgeon to the West End Hospital for Nervous Diseases, chief surgeon to the Metropolitan Police, and, during the War consulting surgeon to the British army. He was knighted in 1918. Among his published works are *Surgery of the Brain and Its Membranes* (1907); *Cerebral Decompression* (1912), *Surgery of the Temporal Bone*, 2 vols. (1919), *Surgery of the Heart* (1920) and *History of Surgery of the Brain* (1922). Earlier in his career he wrote two other works in collaboration, *The Healing of Nerves* with Stewart (1901), and *Treatise on Ligature of the Great Arteries in Continuity*, with Edmunds (1891).

BALLANTINE, HENRY WINTHROP (1880-). An American professor of law, born at Oberlin, Ohio, and educated at Oberlin, Amherst, and Harvard Colleges and the Harvard Law School. He was admitted to the California bar in 1904 and was lecturer on law at the University of California, 1905-09, and assistant professor of law at Hastings College of Law in San Francisco. He was dean of the

Law School of the University of Montana, 1911-13, professor at the Law School of the University of Wisconsin, 1913-16, and dean of the College of Law of the University of Illinois, 1916-20. In 1920 he became professor of law in the University of Minnesota. Besides contributions to periodicals, he has written *Problems in the Law of Contracts and Preparation of Contracts and Conveyances* (1921).

BALLET. The year 1910 marks the beginning of a new era in the history of the ballet. In May of that year Sergei Diaghilev appeared in Paris with his new and individual creation, the Ballet Russe, which immediately created a sensation. He had been working for several years toward the realization of his new ideas and had found sympathetic allies in Leon Bakst, the painter, and Michael Fokin, the director of the Imperial Ballet in Moscow. Fokin, before meeting Diaghilev, had seen Isadora Duncan interpreting choreographically masterpieces of absolute music (Beethoven's Seventh Symphony, Chopin, Schumann, etc.). Her art suggested to him the idea of using the mere technical skill of the dancer as a means for the expression of definite emotions through pantomime. Thus the collaboration of Diaghilev, Fokin and Bakst resulted in the development of the ballet by coordinating dancing, stage-decorations, costumes, lighting-effects and music, and fusing these concomitant elements into a homogeneous whole. Moscow thus became the cradle of the new art. The beginning was made with the ballets in the regular repertory, which were interpreted in the new style. Then, following the example of Isadora Duncan, Fokin adapted choreographic actions to famous instrumental works, such as Rimsky-Korsakov's *Scheherazade*, Debussy's *L'Après-midi d'un Faune*, Strauss' *Till Eulenspiegel*. About that time Diaghilev met Stravinsky, then entirely unknown, whose style of music seemed to fit admirably into the general scheme of things. The young musician was commissioned to write the music to *L'Oiseau de Feu*. In 1909, Diaghilev visited Paris with an operatic company, ostensibly for the purpose of introducing Russian operas, in which ballets figure extensively. Incidentally, separate performances of standard ballets were also given, and these aroused the greatest enthusiasm. The following year Diaghilev returned, but only with the Ballet Russe. It was then that Stravinsky's ballet, *L'Oiseau de Feu*, was produced with sensational success. The next year (1911) furnished another sensation, the same composer's *Petrushka*. Two years later these phenomenal successes were even eclipsed by *Le Sacre du Printemps*. The opinion of musicians regarding the value of Stravinsky's scores as absolute music does not enter into consideration here; what counts is the fact that this music fits into the general ensemble as no other music does. This was proved before long, when Diaghilev commissioned ballets from other composers of considerable reputation: Debussy (*Jeux*), Ravel (*Daphnis et Chloé*), Hahn (*Le Dieu bleu*), Dukas (*La Péri*), Tcherepnin (*Narcisse, Le Pavillon d'Armide*), R. Strauss (*Légende de Joseph*). Paris had gone wild over the new art, London fully indorsed the verdict of Paris, and even conservative New York gasped when the new organization made its first appearance there (1916). Such was the success of the

original season of two weeks that the regular season at the Metropolitan Opera House was shortened by three weeks in order to present the new sensation to the subscribers. Although Diaghilev has not revisited the United States, interest in the new art has been kept alive by the tours of Anna Pavlova, who, though never connected with Diaghilev, has developed her own company along similar lines.

BALLET, GILBERT (1853-1916). A distinguished French neurologist and alienist, born at Ambazac (Haute-Vienne), who received his medical education at Limoges and Paris. In 1882 he became chief of the clinic at the Salpêtrière. In 1914 he drew up a scheme for reforming the French lunacy law and was one of the most active opponents of alcohol abuse in France. He held two chairs in the University of Paris, he was appointed professor of the history of medicine (1907) and clinical professor of mental diseases two years later. In 1897 he published his *Psychoses et Affections Nerveuses* and in 1902 collaborated with Proust in the publication of the *Traité de la Neurasthénie*. His greatest work was the *Traité de Pathologie Mentale* (1903). His *Life of Swedenborg* appeared in 1899. Two translations of his *Neurasthénie* were published in English, in 1902 and 1911, and did much to make him known outside of France.

BALLIN, ALBERT (1857-1918). A German merchant, director-general of the Hamburg-American line. He was born in Hamburg and had a commercial education, both at home and in England. After organizing the emigrant traffic of the Carr Line, he took charge of the passenger traffic of the Hamburg-American Line; in 1886 he became a director and subsequently director-general. The expansion of the company was due to his efforts. He increased the share capital tenfold and by acquiring other lines extended the business of the company to all parts of the world. He was the author of the German-American shipping agreement of 1902. As a special confidant of William II, he advised him on all commercial questions. During the War he published some newspaper articles justifying Germany.

BALLIN, HUGO (1879-). An American figure and decorative painter (see Vol. II), president of Hugo Ballin Inc. who produced and mounted more than eighty feature motion pictures including: *East Lynne*, *Pagan Love*, *Baby Mine*, *The Journey's End*, *Jane Eyre*, *Vanity Fair* and *Married People*.

BALLOON. See AERONAUTICS.

BALLOONS, IN WARFARE. See STRATEGY AND TACTICS.

BALMONT, KONSTANTIN D. (1867-). A Russian poet, the founder of the Modernist school of Russian poetry with Bryusov, one of the leading symbolists. He at first made a great sensation but later lost some of his popularity on account of frequent repetitions. He translated extensively from other languages, especially English and wrote many critical essays. Some of the best known of his several volumes of poems are *Under Northern Skies* (1894), *Silence* (1898), *Burning Buildings* (1900), *Let Us Be Like the Sun* (1903), *Love Only* (1904), and *The Flame-Bird* (1907). He also wrote *Phlox Clusters* after a journey to Mexico, besides many short stories and a book of poems for children. His translations include Shelley's complete works, Whitman (most of

the *Leaves of Grass*), Poe, Ibsen's dramas, Calderon's poems, and works from the German, Polish and Sanskrit.

BALTIC PROVINCES. A term applied to three former provinces of the Russian Empire, Courland, Livonia, and Esthonia, in the region of the Baltic Sea. At the conclusion of the War a German army occupied the provinces, and article 12 of the Armistice Convention called for its withdrawal "as soon as the Allies shall consider this desirable." To embarrass the Powers, however, the Germans decided to withdraw at once, and beginning with November, 1918, detachments quit the country as Bolshevik forces spread westward. The situation was further complicated when German troops under General von der Goltz were induced to stay in Latvia to play the rôle of liberators. February, 1919, saw 20,000 Germans concentrated in the Libau-Windau area and actively meddling in Latvian affairs. The tone of the Allied notes became caustic with this turn of events. On Apr. 23, 1919, the Allies called for the end of German interference in local matters and the recall of von der Goltz; on June 18 a demand was made for German evacuation in accordance with the terms of the Armistice. But an ultimatum from General Foch in the summer succeeded neither in hastening withdrawal nor in preventing the German march north into Esthonia. It was not until the Supreme Council threatened economic pressure that Germany showed a willingness to heed Allied protests. A mixed commission was appointed to superintend the withdrawal; evacuation was begun in November, not without material damage to the population; and by the middle of December it was complete. The subsequent history of the Baltic Provinces is given under the names of the two Republics, Esthonia and Latvia (q.v.) which were created out of this territory.

BALTIMORE. Metropolis of Maryland. The area of the city increased from 31.8 square miles in 1914 to 91.93 square miles in 1924 of which 78.72 square miles was land; the population rose from 558,485 in 1910 to 733,826 in 1920 and to 773,580 by estimate of the Bureau of the Census for 1923. An extensive municipal improvement programme was developed in 1920. Loans for \$51,750,000 were authorized by popular vote in that year, and in 1922 another loan of \$15,000,000, in addition to the \$7,000,000 allotted for the purpose from the earlier loan, was voted for school improvement. With these sums 16 new schools and a city college were built or under construction by 1924, and other school houses already built were being repaired and improved. The water supply for the city for many years to come also was assured by the raising of the Loch Raven dam from 188 to 240 feet elevation, the purchase of 4000 acres of land and the razing of two villages. A large water main was extended into each section of the new annex to the city, and the private water companies operating there were purchased. A filtration plant was built, and plans were made for increasing its capacity. The sewage plant was enlarged and 162 miles of sewers laid in the old city and the annex. The municipal hospital for communicable diseases was under construction in 1923; the police department was reorganized with a commissioner at its head, and a \$1,000,000 loan for the erection of police buildings was

approved in 1923 and plans were prepared for the erection of a building adjoining the Cure Centre; and twelve new engine houses for the fire department were under construction. Progress was made in smooth street paving and several bridges were built.

For the development of the harbor, the most extensive of these projected improvements, \$10,000,000 was available in 1924 of the \$50,000,000 the State legislature authorized the city to vote as a loan for the purpose as well as an additional loan of \$2,500,000. In 1923 work had already begun on the McComas Street bulkhead, the first in the plan of the port development commission for this group of projected piers, and negotiations were being carried on for the contract for a \$4,000,000 pier. The complete development ultimately was to have the most efficient handling devices, warehouses, etc., and complete railroad communications with the terminus. The following additional loans were to be submitted to the voters in November, 1924: \$10,000,000 for sewers; \$7,000,000 for paving, bridges and grade crossings; \$1,500,000 for underground conduits for wires; and \$2,000,000 for a municipal building to provide space for city departments occupying buildings in different sections of the city.

The following comparative summary shows the increase in manufacturing in Baltimore from 1914 to 1919, as prepared by the Bureau of the Census.

	1914	1919	Per cent of in- crease
Number of establishments	2,502	2,797	11.8
Persons engaged in manufacture	87,453	117,140	33.9
Capital	\$177,301,000	\$434,244,000	144.9
Services	48,978,000	137,144,000	180.0
Materials	120,538,000	427,756,000	254.9
Value of products	215,172,000	677,878,000	215.0

Between 1919 and 1923, according to statistics furnished by the Baltimore board of trade, 284 additional industries were established and 402 expansions of existing industries were made, representing a plant investment of \$130,252,200.

In 1922 Baltimore's bank clearings totaled \$4,141,820,192, a gain of 16.5 per cent over 1918 and the large gain of 125.8 over 1916. The total bank resources increased from \$334,369,000 in 1916 to \$532,679,691 in 1923.

In May 1923, after much investigation, a zoning ordinance was adopted regulating the height and bulk of new buildings, the size of courts and yards, the number of families permitted to be housed per acre, and the location of industries and trades. It divided the city into four use districts, five height, and six area districts. A model elevator code was enacted.

BANAT OF TEMESVÁR. Formerly a territory of the Hungarian Kingdom but since 1919 a Rumanian province of the same name. Its area is approximately 10,000 square miles, and its estimated population, 1,580,000. In 1916, in order to gain Rumanian support, the Allies, by a secret treaty of whose terms the Serbs were not apprised, promised Rumania the entire Banat. This was done in spite of the fact that the district is ethnographically by no means a homogeneous unit, there being Slavs in the west, Rumanians in the east, and strong Hungarian and German minorities throughout. In 1919, an act of union of the

Banat with Rumania was promulgated by the Rumanian Crown and the Peace Conference was confronted by a *fait accompli*. The Supreme Council, however, refused to recognize the annexation and by the statement of June 12, 1919, divided the Banat between Jugo-Slavia and Rumania. Meanwhile the Serbs occupied the district, and, partly in protest against an action that seemed to have the tacit consent of the Supreme Council, the Rumanians marched into Hungary and invested Budapest. It was not until the signing of the Treaty of the Trianon (June, 1920) that Rumania finally signified her consent to the partition of the district. By this arrangement, the counties of Krassó-Szörény and Temes in the east were granted to Rumania, and the county of Torontál, bordering on the Danube, to Jugo-Slavia. The economic considerations underlying the diplomatic controversy were perhaps of greater importance than the purely racial. To the Serbs, whose lands are deficient in cereals, the rich farming country of the Banat made an especial appeal. The peasants of Temesvár wished to join the Serbs; the landowners, because of Rumania's traditional friendliness toward their class, sought annexation to her. Again, any north and south boundary line through the country must disorganize its economic life because the westward-flowing streams, the railways, and canals, all would be cut. That both countries desired the whole Banat was natural, and the partition of the territory in 1920 left a group of problems difficult of solution and containing elements of inevitable discord.

BANCROFT, WILDER DWIGHT (1867-). An American chemist (see VOL. II). During 1917 and 1918 he was chairman of the subcommittee on electro-chemistry of the National Research Council and chairman of the division of chemistry (1919-20). He was also a member of the advisory committee of the Chemical Warfare Service and lieutenant-colonel in 1918 and 1919. In 1921 he wrote *Applied Colloid Chemistry*.

BANDHOLTZ, HARRY HILL (1864-1925). An American soldier (see VOL. II). He served on the Mexican border in 1916 and went to France as provost marshal-general (1918-19). He was American representative on the Inter-allied Military Mission to Hungary in 1919. On Sept. 1, 1921, he was appointed to command of the District of Washington. In September, 1921, he was sent to West Virginia and successfully suppressed a miners' insurrection there. He received many foreign decorations.

BANDLER, SAMUEL WYLLIS (1870-). An American obstetrician and gynecologist, educated at Columbia University. He became professor of obstetrics and gynecology in the New York Post-graduate Medical School. In addition to his unusual activity in the publication of medical papers on obstetrics, gynecology, and endocrinology, he wrote many books, including *Dermoid and Other Cysts of the Ovary* (1901), also issued separately in German; *Uterine and Tubal Gestation* (1903), *Medical Gynecology* (1908), *Vaginal Celotomy* (1911), *The Expectant Mother* (1916) and *The Endocrines*, 1920. In 1901 he published a translation into English of Abel's *Gynecological Pathology*.

BANERJEE, SIR SURENDRANATH (1848-1925). An Indian political reformer and journalist educated at Doveton College, Calcutta, and Uni-

versity College, London. Early in his career he opened a school in Calcutta which later became Ripon College. In 1876 he became editor of the Bengalee newspaper, a political instrument in his hands. In 1905 he supported the boycott of foreign goods and the "national education" movement. He went to London in 1919 as representative of an "Indian Liberal" organization which he had formed and gave evidence before the Joint Parliamentary Committee of both Houses on Indian Reforms. Subsequently he accepted office as Minister for Local Government and Sanitation in Bengal and was knighted in 1921.

BANG, IVAR (1869-1918). An eminent Swedish chemist. He began his career as a practicing physician but took up chemistry under Professor Hammarsten of Upsala, 1897-99. His research attracted wide attention and led to his appointment in 1904 as professor of medical chemistry in the University of Lund. Of several branches of biochemistry to which he devoted especial attention the most significant was the so-called micromethod of quantitative analysis of the blood. As a result of this it is possible to determine the percentage of constituents by testing very small amounts of blood. His writings include *Chemie und Biochemie der Lipide* (1911), *Der Blutzucker* (1913), *Methoden zur Mikrobestimmung einiger Blutbestandtheile* (1916), and *Lehrbuch der Harnanalyse* (1918).

BANKING. See FINANCE and BANKING.

BANKS, COOPERATIVE. See LABOR BANKS.

BANNING, KENDALL (1879-). American editor and author, born in New York and educated at Dartmouth. During the War he served as major in the Signal Corps (1917), major on the General Staff of the United States army (1918-19), and officer in charge of compiling a history of the War. He was a member of the Committee on Public Information. Formerly he was manager and associate editor of *System* (1903-17) and managing editor of *Hearst's Magazine* and *Cosmopolitan* (1919-21). He has contributed to the magazines and is the author of several plays.

BANTA, ARTHUR MANGUN (1877-). An American zoologist, born at Greenwood, Ind. He was educated at Indiana and Harvard Universities. He was a teacher in public schools (1895-1901); assistant in zoology, Indiana University (1903-05); professor of biology, Marietta College (1907-09); and resident investigator at the Station for Experimental Evolution, Cold Spring Harbor (1909-). His researches have been on the development of pigment in animals, on the effects of changed environment on cave-dwelling and non-cave-dwelling animals, and on sex determination.

BANTING, FREDERICK GRANT (1892-). A Canadian physician who in 1922 received the larger share of credit for the discovery of insulin (see INSULIN and DIABETES), apparently one of the greatest practical triumphs of laboratory medicine. He took his medical degree at the University of Toronto in 1916. Two years later he became a Member of the Royal College of Surgeons and Licentiate of the Royal College of Physicians. During the War he was a captain in the Army Medical Corps. The first announcement of his great discovery was made in the *Journal of Laboratory and Clinical Medicine*, vol. vii (1921-22). Banting and Best also published jointly an article on the treatment

of diabetes mellitus in the *Canadian Medical Association Journal*, vol. xii (1922). In 1923 the Canadian Government awarded Banting an annuity of \$7500, to enable him with freedom from pecuniary worry to devote his time to the further study of this and similarly important matters. At the time when his discovery was announced he held the office of resident surgeon of the Hospital for Sick Children, Toronto.

BANTU. See ETHNOGRAPHY.

BAPTISTS. The second largest Protestant denomination in the United States, first established in America about 1638-39. Three principal bodies represent the Baptist churches in America, the Northern, Southern and National (Negro) Conventions. Fourteen separate Baptist organizations were listed in the American Baptist Year Book, but the minor divisions, known as Primitive, United, Free, General, etc., are separated from the main body of the denomination by no serious differences and the trend for many years has been in the direction of Baptist unity. The Free Baptists, for example, have merged with the Northern Convention. During the decade 1914-1924 Baptist membership in America increased from 5,799,233 to approximately 8,500,000. In the same period the Southern Convention advanced in membership from 2,522,623 to 3,352,938; the Northern Convention from 1,291,688 to 1,344,346 and the National Convention from 1,934,952 to upwards of 3,250,000. The denomination made enormous gains in membership among the Negroes, both North and South, and a Negro Church, Olivet of Chicago, had the largest Baptist congregation in the world. The aggregate Baptist membership of all countries from whose churches reports were obtained, approached 10,000,000 in 1924. There was a very rapid increase in Russia and Eastern Europe generally, after 1917, as the Slav population found the Baptist doctrine and polity congenial and turned to them as a substitute for the disrupted churches of the prerevolutionary period. No accurate statistics were obtainable, but there were in 1924 far more than 1,000,000 Russians who called themselves Baptists.

While the attitude of opposition to infant baptism, with its corollary acceptance of "believer's baptism," is one of the distinguishing marks of all Baptist bodies, there is no Baptist creed. It is characteristic of the denominational spirit that no authority exists with power to bind the individual churches in respect to matters of faith. The Northern Baptist Convention in 1924 accepted as an expression of the Baptist position the Stockholm declaration of the Baptist World's Alliance, a statement covering those points upon which practically all Baptists are agreed. This action was taken with the definite provision that the statement was in no sense to be regarded as a creed.

Baptist churches always held to the congregational or independent system. Indeed the Baptist temper and tradition would hardly tolerate any other, though there was a growing disposition to moderate an individualism which left each church absolutely sovereign in matters touching its own worship and discipline, but lacked certain advantages in achieving purposes held by all the churches in common. This tendency to coordinate Baptist activities found expression in the New World Movement of the Northern Convention, a five-year programme that terminated in April, 1924, and in the

\$75,000,000 campaign of southern Baptists. In the case of the northern Baptists the movement resulted in the establishment of a permanent organization to unify and coordinate the work of the various participating organizations, known as the Board of Missionary Cooperation. This board became the agent of seven national societies and boards, 36 State conventions, 14 standard city mission societies, and 52 schools and colleges, for the purpose of disseminating information regarding the various organizations and raising funds for them. The nearly 10,000 Baptist churches which united through the Northern Convention in support of all these agencies remained as independent as ever, but they were applying such a measure of cooperation as their experience after 1919 showed to be possible and desirable.

The period which saw the rise of the cooperative spirit in the denomination also saw the Baptist organizations take advanced ground for a ministry of service. A strong Baptist interest always supported schools maintained under Christian influences. Such institutions as Chicago, Brown, Colgate and Rochester universities and Vassar College testify to a zeal for education that has not been limited to America. In Burma, Judson College, bearing the name of the most famous of Baptist missionaries, was constituted an integral part of the University of Rangoon, taking equal rank with the Government college. Great progress was made in the development of opportunities for the education of women in the Orient, especially in India and China. Baptists maintained missions in 11 different national fields and had churches in every part of the globe.

BAPTISTS, FREE. The organizations of the Free Baptists were undergoing union with the Northern Baptist Convention throughout the whole decade 1914-24. The movement began in 1911, and complete financial arrangements were made in 1919, but the denomination retained its separate legal existence for the administration of funds and interests which awaited final settlement and transfer. See BAPTISTS.

BÁRÁNY, ROBERT (1876-). An Austrian otologist, born in Vienna. Originally he was an assistant of Pollitzer and as a student in the University of Vienna, he began in 1902 a series of investigations on the internal ear which culminated in his monograph, *Physiologie und Pathologie des Bogengangapparates beim Menschen*, for which he was awarded the Nobel Prize in medicine in 1915. During the War he officiated as military surgeon and was taken prisoner. In 1919 he published *Primäre Exzision und Primäre Naht Accidentellen Wunden*. In 1916 he received the appointment of professor of otology in the University of Upsala. His most recent work is *Die Radikaloperation des Ohres*, 1923.

BAR ASSOCIATION, AMERICAN. An organization founded in 1878 to advance the science of jurisprudence, promote the administration of justice and uniformity of legislation and of judicial decision throughout the nation, uphold the honor of the profession of the law, and encourage cordial intercourse among the members of the American Bar. Membership increased from 10,500 in 1916 to 21,000 in 1923. Many important resolutions were adopted at the annual meetings held during the decade 1914-1924. In 1918 resolutions were passed protesting against House Bill Number 9354 as an

attempt to deprive the judges of the United States courts of the right to express their opinion on questions of fact in jury cases, and supporting every grant of power desired by the President to help in winning the War, but expressing the opinion that constitutional changes were unnecessary; in 1919 approving an act to make uniform in all States the law of conditional sales and the law of fraudulent conveyances and to continue organized opposition to judicial recall; in 1921 censuring Kenesaw M. Landis in accepting private employ while a member of the Federal Bench; in 1923 favoring adherence to the Permanent Court of International Justice, calling a new conference of nations at The Hague to restate the established rules of international law, to agree on certain amendments, and to consider certain subjects which were not adequately regulated by international law.

BARBADOS. The most easterly of the West Indian Islands, belonging to Great Britain, with an area of 166 square miles, and a population (census of 1921) of 156,312. The cultivation of sugar and cotton continued the leading activities. The immediate years after the War were marked by great prosperity in the island, the culmination being reached in 1920 when exports showed a value of £4,865,700, and imports £5,145,537. (Compare with the 1913-14 figures of exports of £760,699; imports £1,353,059.) In 1921, there was a visible drop, though even then the trade was nearly twice that of 1913. The year 1922 marked a further decrease, the exports being £1,259,794 and imports £2,480,320. Favorable weather conditions, however, in the first quarter much improved the crops, which gave far better results than had been anticipated, and by the end of the year the colony had largely recovered from its depression.

BARBER, DONN (1871-1925). An American architect, born in Washington and educated at Yale and Columbia Universities and in Paris. In 1900 he began the practice of his profession in New York, where he designed many business and other buildings, including the Lotus Club and the Institute of Musical Art. Other buildings planned by him are the Connecticut State Library and the Department of Justice Building in Washington. He was one of the originators of the atelier idea in the United States. For many years he was editor of the *New York Architect*. He belongs to many architectural societies.

BARBOUR, RALPH HENRY (1870-). An American author, born at Cambridge, Mass. He contributed verse and short stories to magazines under the pen name of "Richard Stillman Powell" but became best known under his own name as one of the most popular writers of stories for young people. He is also the author of numerous entertaining romances and of the excellent Indian story, *Metipom's Hostage*. His more recent writings include *Under the Yankee Ensign* (New York, 1919), *Mystery of the Sea Lark* (New York, 1920), *Quarter Back Bates* (New York, 1920), *Metipom's Hostage* (Boston, 1921), *Over Two Seas* (New York, 1922), and *Right End Emerson* (Football Eleven Books, New York, 1922).

BARBUSSE, HENRI (1874-). A French writer and novelist. He acquired international fame almost over night as the result of the publication in 1916 of his war novel, *Le Feu*. It is the story of a squad in the trenches, told

in the poilus' own unvarnished language. The gruesome, crude details of butchery and animality of life at the front are realistically narrated. Against this background the author makes his heroes philosophize on the future of humanity. The book is in the best sense of the word propaganda against war. Despite its pacifistic tendencies, *Le Feu* was awarded the Prix Goncourt. It was followed by *Clarté* and *La Lueur dans l'Abîme*, both of which continue the author's purpose of using art as a vehicle for social regeneration. At the close of the War, M. Barbusse organized the Clarté movement, which sought to group together the writers of the world and interest them in the social and political progress of humanity. He also organized a union of war veterans of France to fight for the ideal of internationalism. Both these organizations drifted into politics and became more or less affiliated with the regular syndicalist and socialist groups. Besides the works mentioned above, M. Barbusse wrote *Les Supplantes* (1903); *L'Enfer* (1908); *Nous Autres* (1914); *Quelques Coins du Cœur* (1921), and *Le Couteau entre les Dents* (1921).

BARCELONA. See RAPID TRANSIT.

BARD, HARRY ERWIN (1867-). An American educator in Peru. He was born at Crawfordville, Ind., and educated at Wabash College and Columbia University. After holding positions as instructor, 1894-98, he was appointed division superintendent of schools in the Philippine Islands (1907-09) and subsequently became official advisor of the Ministry of Instruction at Lima, Peru (1909-12; reappointed, 1919); organizing director of the Pan-American Division of the American Association for International Conciliation in New York (1913-15) and secretary of the Pan-American Society of the United States (1915-19). He assisted in preparing the organic school law of Peru (1910-12) and in putting it into execution (1920). Besides contributing to the *Cyclopædia of Education*, he is author of *The City School District* (1909), *Intellectual and Cultural Relations between the United States and the Other Republics of America* (1914), and *South America* (1916).

BARDET, GÉOFRÉY (1852-1923). A French physician and pharmaceutical chemist, distinguished especially as a therapist. Born at Dreux, the son of a physician whom he expected to succeed in practice, he became interested in chemistry and spent some years in the laboratory of Wurtz. He received his degree in medicine from the University of Paris in 1877; his thesis on the soporific alkaloids of opium was crowned by the faculty. After graduation he became laboratory chief for Dujardin-Beaumetz. With Trillat he performed an early feat in synthetic chemistry by obtaining the drug later known as urotropin. His major literary activity was the publication at irregular intervals of *Nouveaux Remèdes*, of which 20 volumes were issued between 1886 and 1911. He edited the *Bulletin Général de Thérapeutique* from 1895 to 1917. In his alma mater he filled the chair of hydrology; besides his knowledge of medicinal waters, he was known as an expert mineralogist. At the International Medical Congress at Paris in 1889 he functioned as general secretary and chief organizer.

BARGONE, CHARLES ("CLAUDE FARRÈRE") (1876-). A French novelist, born at Lyons, and educated at Marseilles and Toulon. Like

Pierre Loti, with whom he has many points in common, Farrère entered the French navy, and it was as a naval officer that he produced his exotic novel, *Fumées d'Opium*, which won the Prix Goncourt for 1905. His succeeding works also dealt with Oriental scenes,—Indo-China, Japan, and Turkey, countries where civilization had not yet abolished mystery. He made two attempts to get away from his exoticism, in *Mademoiselle Daw*, *Jeune Fille*, and its sequel *Les Petites Alliées*, but in the rest of his work he returned to the theme of adventure. In these he sought the manner of Edgar Allan Poe. Besides those mentioned above, he wrote. *Les Civilisés*; *L'Homme Qui Assassina*; *La Bataille*; *La Maison des Hommes Vivants*; *Thomas l'Agnélet*; *La Dernière Déesse*, and *Les Hommes Nouveaux*.

BARING-GOULD, SABINE (1835-1924). An English author (see VOL. II). His last works include *The Vicar of Morwenstow* (1919), *The Evangelical Revival* (1920), *In the Roar of the Sea* (1920), and *Mehalah* (1920).

BARKER, ELSA (?). An American author, born at Leicester, Vt., and educated privately. She was associate editor of the *Consolidated Encyclopaedic Library* (1901), lecturer for the New York Board of Education (1904-05), and a member of the editorial staff of *Hampton's Magazine* (1909-10). Besides contributing poems and articles to magazines, she is the author of some novels and several volumes of poetry. Her poems, especially *The Book of Love*, have received high praise from critics both for their lyric feeling and style. Her prose works, dealing for the most part with spiritualism (*War Letters from a Living Dead Man*, 1915) and psycho-analysis (*Fielding Sargeant*), received less universal approbation. Her recent works include *Songs of a Vagrom Angel* (New York, 1919) and *Fielding Sargeant* (New York, 1922). She also wrote a play, *The Scab* (produced in New York and Boston, 1904-05).

BARKER, ERNEST (1874-). English philosopher and educationist. He was educated at Balliol College, Oxford, and this University remained the scene of his activities until 1920. At one time or another he was fellow of the University, Merton, St. John's, and Lew. In 1920 he went to London University, where he became principal of King's College. In 1906 he published his *Political Thought of Plato and Aristotle*, revised in 1918 as *Greek Political Theory*, a work of the first importance, which exerted much influence on the political thought of England. His intimate knowledge of the whole range of political philosophy was displayed in his masterly summary, *Political Thought in England from Herbert Spencer to To-day* (1915). Other works from his pen were *The Dominican Order and Convocation* (1913) articles in the *Cambridge Medieval History and Greek Politics* (1923).

BARKER, (HARLEY) GRANVILLE (1877-). An English playwright, born in London (see VOL. II). His American season as a producer at Wallack's Theatre in New York in 1916 stimulated the American stage. He produced *A Midsummer Night's Dream*, Shaw's *Androcles and the Lion*, *The Doctor's Dilemma*, France's *The Man Who Married a Dumb Wife* and other plays. The Neighborhood Playhouse achieved success with his *Madras House* (New York, 1921), and Winthrop Ames with *Anatol*

(a paraphrase, from the German of Schnitzler). He has also written *Souls on Fifth* (1916), *Three Short Plays* (1917). *The Secret Life* (1923), and English versions of G. Martinez Sierra's *The Romantic Young Lady*, *Wife to a Famous Man*, *The Kingdom of God*, *The Two Shepherds*, and *A Lily Among Thorns*, all in collaboration with Helen Granville Barker.

BARKER, SIR HERBERT ATKINSON (1869-). A British manipulative or "bloodless" surgeon, born in Southport. He was a pupil of Atkinson, a manipulative surgeon. In 1904 Barker succeeded to Atkinson's practice on the latter's death. His career after 1904 was most successful. Medical opposition was not directed against him personally, and members of the medical profession often referred cases of a certain type to him. His work was largely with orthopaedic patients, especially those having affections of the knee, flat foot, etc. During the War the medical profession opposed the demand to turn wounded soldiers over to Barker's supervision. He was knighted by the King in 1922.

BARKER, J. ELLIS (1870-). An English journalist (see VOL. II). His effort to arouse England to the German peril in the period antecedent to the War gave his writings of the years 1914-18 a wide audience both in England and the United States. Articles published in the periodical press were collected under the titles *British Statesmanship* (1917) and *Economic Statesmanship* (1918). Other works included *Modern Germany* (enlarged edition, 1915) and *The Foundations of Germany* (1916).

BARKER, LEWELLYS FRANKLIN (1867-). An anatomist born at Norwich, Ont. (see VOL. II). As the successor to the late Dr. Osler in the Johns Hopkins Hospital Medical Clinic, Dr. Barker has shown an extensive literary activity like that of his predecessor. In addition to many minor contributions to periodical literature in various departments of internal medicine and neurology, he has published *Clinical Medicine, from the Tuesday Clinics of Johns Hopkins* (1916) and *Clinical Diagnosis of Internal Diseases* (1916), comprising three large volumes of more than 3000 pages of the medical library known as *Monographic Medicine*. He was also senior editor, with Hopkins and Nossenthal, of the five-volume system of medicine entitled *Endocrinology and Metabolism* (1922).

BARNARD, EDWARD EMERSON (1857-1923). An American astronomer (see VOL. II). He received the Bruce gold medal from the Astronomical Society of the Pacific in 1917.

BARNARD, GEORGE GRAY (1863-). An American sculptor (see VOL. I). His famous bronze statue of Abraham Lincoln in Cincinnati (1917), with a replica in Manchester, England, has caused more discussion than any other American sculpture. Its rugged strength and powerful characterization of the great tribune of the common people place it in the foremost rank of American sculpture. Other important recent works are: "Maidenhood," "Adam and Eve" (Tarrytown, N. Y.; Boston Museum); "Rising Woman" (Metropolitan Museum, New York City); and a heroic head of Lincoln (Bourne Collection, Portland, Ore.).

BARNARD COLLEGE. The undergraduate college for women in the educational system of Columbia University, New York City, organized in 1889. The student body grew from 733 members in 1914 to 923 in 1924 and the faculty from 99 to 112. The Ella Weed Library in-

creased from 8600 to 18,000 volumes, the equipment increased in value from \$2,027,246 to \$2,500,000, and the annual net income from \$61,125 to \$178,000. A new dormitory was in process of construction in 1924. President, Nicholas Murray Butler, LL.D. (Cantab), D.Litt. (Oxon), Hon. D. (Paris). Dean, Virginia Crocheron Guildersleeve, Ph.D., LL.D. See COLUMBIA UNIVERSITY.

BARNES, GEORGE NICOLL (1859-). A British labor representative plenipotentiary at the Paris Peace Conference (1919). He was born at Lochie, Scotland, and for many years worked as an engineer. In 1906 he defeated Bonar Law in the election of a representative from Blackfriars (now Gorbals). During Lloyd George's ministry he was Pensions Minister (1916-18) and minister without portfolio in the Coalition Government, from which he resigned in 1920. He was sworn of the Privy Council, from which he resigned, to succeed Arthur Henderson as labor representative in the War Cabinet. After the Peace Conference he attended the International Labor Conference at Washington. He has interested himself in old age pensions, the welfare of discharged soldiers, the Irish problem, and the League of Nations.

BARNES, JAMES (1866-). An American author (see VOL. II). He did important war work as head of the Princeton Aviation School for several months, and major of the Aviation Section of the Signal Corps of the United States Reserve. He was head of the photographic division of the army and was sent to France, as commander of the United States School of Aerial Photography, to organize that work at the front.

BARNOUW, ADRIAAN JACOB (1877-). An educator born in Holland, and educated at the Municipal Gymnasium, Amsterdam, and the Universities of Leyden and Berlin. During 1902-19, he was professor of Dutch language and literature at the Municipal Gymnasium at The Hague, lecturer in English at the University of Leyden, and correspondent at The Hague of the *Nation* (New York). After 1921 he was professor of the Dutch language and literature at Columbia University. He was associate editor of *The Weekly Review* (1919-21). Among his works are *Anglo-Saxon Christian Poetry*, translated by Louise Dudley (1914); *Beaterijs, a Middle Dutch Legend* (1914); and *Holland under Queen Wilhelmina* (1923).

BAROJA, PIO (1872-). A Spanish novelist born at San Sebastian and educated in the Institute of Pamplona and at San Carlos. After practicing medicine and running a bakery for six years in partnership with his brother, he drifted into journalism and the writing of novels, which, though sometimes treating of forbidden subjects, are pithy and contain many quaint and accurate descriptions of Spanish life. Baroja is a cynically candid but cultured and liberal writer. Among his recent works are *The City of the Discreet* (1917); *Cesar or Nothing* (1919); *Youth and Egotism* (1920); *The Quest* (1922); and *Needs* (1923).

BARR, AMELIA E. (1831-1919). An Anglo-American novelist (see VOL. II). Some of her latest works were *Three Score and Ten* (1915), *The Winning of Lucia* (1915), *Profit and Loss* (1916), *Joan* (1916), *Christine* (1916), and *An Orkney Maid* (1917).

BARRÈRE, CAMILLE (1851-). A French diplomat. As a youth he prepared for a jour-

nalistic career and attended the Congress of Berlin as correspondent for a Parisian paper. His articles attracted the attention of Waddington, then French minister of foreign affairs, who offered him a post in the diplomatic corps. He rose rapidly through the ranks, and after serving as minister to Bavaria, he became French ambassador to Italy in 1897. He negotiated the commercial treaty of 1898 and throughout his long residence in Italy worked to bring about a good Italian-French understanding. In 1915 he won the diplomatic duel with Prince von Bülow and helped to bring in Italy to the side of the Allies. At the close of the War he retired from diplomatic service.

BARRÈS, MAURICE (1862-1923). A French novelist and politician (see VOL. II). During the War he devoted his talent to patriotic journalism and published many addresses, lectures, and volumes of propaganda. Hostilities ended, he went back to literature. His novel, *Un Jardin sur l'Oronie* (1922), was hailed as a masterpiece of romantic fiction. Written only for the most cultivated readers, it transports the imagination to the Holy Land, and develops its theme by describing the love of a Christian knight for a Mohammedan princess. The story of this passion is handled both sympathetically and ironically. Of his other published works since 1914, the more important are *La Grande Pitié des Églises Françaises* (1914); *L'Âme Française et la Guerre* (1915); *Les Traits Éternels de la France* (1916); *La Colonne Inspirée* (1916); *Colette Baroche* (1918); *La Lorraine Dévastée* (1919); *Le Génie du Rhin* (1921); *Un Homme Libre* (1922); and a six-volume *Chronique de la Grande Guerre* (1920-22). In politics M. Barrès made himself known as the advocate of the annexation of the Rhineland to France.

BARRETT, CHARLES SIMON (1866-). An American farm expert, born in Pike county, Ga., and educated in the public and normal schools of Ohio and Indiana. For many years he engaged in general farming and teaching and then began the organization of farmers' societies; in 1905 he was elected president of the Georgia Farmers' Union. In the following year he became president of the National Farmers' Union and was reelected. He served on the Country Life Commission founded by Theodore Roosevelt and was a delegate to many meetings on agricultural subjects in foreign countries. President Wilson appointed him a member of the National Agricultural Advisory Commission; he was also a member of the Price Fixing Commission for the wheat crop in 1917. He was a member of the advisory council of the American delegates to the Disarmament Conference (1921-22).

BARRETT, JOHN (1866-). An American journalist and diplomat (see VOL. II). In 1916 he was delegate of the United States and secretary general of the Pan-American Scientific Congress. He was presiding officer of the second Pan-American Commercial Conference (1919), president of the Pan-American Advertising Association (1919-20), and a member of the governing board of the General Committee on the Limitation of Armament. He published *Pan-American Commerce: Past, Present, Future* (1919) and *Pan-America and Pan-Americanism* (1922).

BARRIE, SIR JAMES MATTHEW, Bart. (1860-). (See VOL. II). His recent work

includes *A Kiss for Cinderella* (1916); *The Old Lady Shows Her Medals* (1917); *Dear Brutus* (1917); *Echoes of the War* (1918); *The Truth about the Russian Dancers* (1920); and *Mary Rose* (1920). Whereas *Dear Brutus* was received by critics and the public as a typical contribution, whimsical, kind, and fanciful, *Mary Rose* failed to duplicate its London success in America and provoked a storm of protest as bearing an alien taint of pessimism and sentimentalized spiritualism. Some of Barrie's novels and plays have been produced in moving-pictures very successfully.

BARRIENTOS, MARIA (1885-) A Spanish coloratura soprano, born at Barcelona, Mar. 10, 1885. A remarkably precocious child, she graduated from the Barcelona Conservatory at the age of twelve, having completed the courses in violin, piano and composition. Two years later, after only six months' study under Ben-net, she made her operatic debut in Barcelona as Selika with such success that she was engaged the following year for La Scala in Milan. Until 1913 she sang in various theatres in Italy and made tours of South America, France, England, Russia, Germany, and Austria. After three years' retirement she made her New York debut at the Metropolitan Opera House as Lucia (Jan. 31, 1916) and sang there till 1920. After that time she appeared chiefly in Italy and South America. In spite of a rather weak voice she won success through perfect vocal technic, musical intelligence, and fascinating personality.

BARROWS, DAVID PRESCOTT (1873-). An American ethnologist (see Vol. II). He became president of the University of California in 1919. During the War he did important relief work as a member of the Committee for the Relief of Belgium in charge of the food supply of Brussels in 1916, and as major and lieutenant-colonel of cavalry in the army (1917-18). He was on active duty in the Philippine Islands and Siberia, 1917-19, and in 1921 became colonel of the 159th Infantry of the California National Guard. Besides engaging in war work, he was actively interested in educational and philanthropic institutions in California and was a member of the California State commission on rural credit and colonization, 1915-17. He is the author of *A Decade of American Government in the Philippines* (1915).

BARRYMORE, ETHEL (1879-). A leading American actress (see Vol. II). Some of her recent performances have been in *The Lady of the Camelias* (1917), *The Off-chance* (1918), *Belinda* (1918); *Declassée* (1919), in which she scored a great success; *Clair de Lune* (1921), *Rose Bernd* (1922), *Romeo and Juliet* (1922), *The Laughing Lady* (1923), and *A Royal Fandango* (1923). She also toured in several of Barrie's comedies.

BARRYMORE, JOHN (BLYTHE) (1882-). American actor and member of a noted theatrical family. He made his debut in *Magda* in Chicago in 1903, and in the following December he appeared on the New York stage in *Glad of It*. He next played in London (1905), and later in Australia, in the company of William Collier. Since his debut, Barrymore has not missed appearing on either the American or the English stage each year. He first attracted serious attention in *Justice* and scored a great success as co-star with his brother Lionel in

The Jest (1919), but it was in *Richard III* (1920) and *Hamlet* (1922) that his art ripened and his reputation became assured. Among other productions in which he has appeared are *A Stubborn Cinderella*, *The Fortune Hunter*, and *Peter Ibbetson* (1917). He has also appeared as leading man in moving-pictures.

BARRYMORE, LIONEL (1878-). An American actor who made his debut in *The Rivals* with his grandmother, Mrs. John Drew, in 1893. He appeared in *Squire Kate* (1896), *Cumberland '61* (1897), and several plays with Nance O'Neill's company. He was two seasons with John Drew. Among other plays in which he has acted are J. M. Barrie's *Pantaloon* (1905), *Peter Ibbetson* (1917), *The Copperhead* (1918), *The Jest* (1919), which were noteworthy successes, in the title rôle of *Macbeth* (1921) *The Claw* (1922), and *Laugh, Clown, Laugh* (1923). He has appeared as leading man in many screen successes.

BARTHOLOMÉ, PAUL ALBERT (?-). A French painter and sculptor (see Vol. II). He became a member of the Royal Academy in 1921. His recent sculptures have been those in commemoration of the authors and dramatists who died in the War: in honor of Raymond the aviator at Montbrison; "Le Monument à Paris 1914-18," place du Carrousel; and "Le monument aux avocats," palais de Justice.

BARTHOUS, LOUIS (1862-). A French statesman and man of letters (see Vol. II). During the War he was minister of foreign affairs in the Painlevé Cabinet (1917). After the Armistice he was instrumental in practically all the governmental overtuins of France. He was minister of war in the Briand cabinet (1921-22), and when this was succeeded by the Poincaré government he became minister of justice. In 1918, M. Barthou was elected to the French Academy, doubtless on the strength of his *Life of Mirabeau*, originally published in 1913. Other works include *Lamartine Orateur*, which M. Barthou considers his masterpiece, and *La Bataille du Marne* (1919).

BARTLETT, FREDERIC CLAY (1873-). An American painter, born in Chicago, who studied at Munich with Gysis, at Paris with Collin, and with Aman-Jean and Whistler. His work includes murals and paintings at the Chicago University Club, murals at the University of Chicago; a landscape, "Roman Afternoon," at Carnegie Institute, Pittsburgh; "Blue Blinds," "Evening White." "Canton Street," murals at the Burnham Library of the Art Institute in Chicago. Mr. Bartlett is a member of the National Institute of Arts and Letters and of the Mural Painters' Royal Academy of Munich. He received a silver medal from the St. Louis Exposition in 1904 and a silver medal from the Panama-Pacific International Exposition, 1915.

BARTLETT, FREDERICK ORIN (1876-). An American writer of popular fiction, born at Haverhill, Mass., and educated in the public schools, at Proctor Academy (Andover, N. H.), and at Harvard University. He was a reporter on the *Boston Record* (1900-02) and on the *Boston Herald* (1902-06). He is the author of many realistic novels and short stories of varied character; tales of adventure, and stories for young people, in which he shows unusual skill in handling a plot and in character drawing. His most successful novel is

The Wall Street Girl. Other works include *The Forest Castaways* (1911); *The Lady of the Lane* (1912); *The Wall Street Girl* (Boston, 1916; New York, 1918); *Joan and Company* (Boston, 1919; New York, 1921), and many short stories.

BARTLETT, PAUL WAYLAND (1865-1925). An American sculptor (see Vol. II). His most ambitious work, the pediment group for the House of Representatives (Washington), was completed in 1916. It is composed of 12 colossal figures representing Democracy protecting Genius, conceived as typical examples of American laborers. Other important recent works are: six large marble statues for the façade of the New York Public Library; a bronze statue of Benjamin Franklin (Waterbury, Conn.), and "Patriotism," a colossal stone statue at Duluth, Minn. Bartlett was elected to the National Academy in 1917.

BARTLETT, ROBERT ABRAM (1875-). An American explorer (see Vol. II). He commanded the third Crocker Land Relief Expedition to New Greenland, returning in 1917. In the same year he was made marine superintendent of the Army Transport Service in New York and in 1920 was raised to the rank of lieutenant commander of the United States Naval Reserve Force. He was awarded the Gold Medal of the Harvard Travelers' Club in 1915, and in 1918 the Back Grant of the Royal Geographic Society for his work in the Canadian government Arctic expedition of 1913-15. He is the author of *The Last Voyage of the Karluk* (1916).

BARTLEY, NALBRO (1888-). An American writer, born at Buffalo, N. Y., and educated at the public high school of that city. She first wrote as a reporter on the *Buffalo Morning Express* (1907-09) and later appeared in New York City as a free lance writer. She has a large following of admiring readers in the popular publications to which she is a frequent contributor. Included among her works are *Paradise Auction* (1917), *Bargain True* (1918), *A Woman's Woman* (1918), *Gorgeous Girl* (1919), *Careless Daughters* (1919), *Gray Angels* (1920), and *Fair to Middling* (1921).

BARTOK, BÉLA (1881-). An Hungarian composer, born at Nagy Szén Miklos. After studying with Kersch and Erkel, he finished his musical education at the Landesmusikakademie in Pesth, where he has been professor of piano since 1906. As a composer he exhibits strong futuristic tendencies. He wrote an opera, *Ritter Blaubarts Burg* (Pesth, 1918), a ballet, *Der Wunderbare Prinz* (1919); a dance-pantomime, *Der Holzgeschnittene Prinz* (1922); a symphonic poem, *Kossuth*; a rhapsody for piano and orchestra; *Two Portraits* for orchestra; several suites for orchestra; a piano quintet and a string quartet, and pieces for piano. He has edited piano works of Haydn and Mozart and published a collection of several hundred Hungarian, Slovakian, and Rumanian folksongs.

BARTON, BRUCE (1886-). An American editor, and writer on everyday ethics. He was born at Robbins, Tenn., and educated at Amherst College. He was managing editor of the *Chicago Home Herald* (1907-09) and of *The Housekeeper* (1910-11); later he became assistant sales manager for P. F. Collier and Son (1912-14), editor of *Every Week* (1914-18), and president of Barton, Durstine and Osborn,

an advertising firm of New York. Besides contributing to magazines, he is the author of *More Power to You* (1917), *The Making of George Groton* (1918), *What Shall It Profit a Man?* (1919); *It's a Good Old World* (New York, 1920), *Unknown* (1921); and *A Personal Letter to the Kaiser* (1916).

BARTON, GEORGE (1866-). An American author and newspaperman born in Philadelphia where he began newspaper work with the *Philadelphia Inquirer* (1837) and the *Evening Bulletin*. He returned to the former as an editorial writer. He has contributed over 200 short detective stories to popular magazines and is the author of many stories for boys. Some of his recent books are *Bell Haven Eleven* (1915), *A Young Knight of Columbus* (1916), *The World's Greatest Military Spies and Secret Service Agents* (1917), *The Mystery of the Red Flame* (1918), *The Pembroke Mason Puzzle* (1920), etc.

BARTSCH, PAUL (?-). A zoologist born at Tuntshendorf, Germany, and educated at the University of Iowa. He was associated with the division of mollusks of the United States National Museum (1896-1905), assistant curator (1905-14); curator of the division of Marine Invertebrates (1905-21); curator of the division of mollusks (1921-); professor of zoology at George Washington University (1899-), director of the histological and physiological laboratories of Howard University (1901-), and associate editor of *The Osprey* (1900-). His researches have been mainly with the mollusks, particularly in experimental breeding of terrestrial forms. He was a member of several expeditions sent out by the National Museum and by the Carnegie Institution of Washington.

BARUCH, BERNARD MANNES (1870-). An American financier, educated at the College of the City of New York (1889). For many years he was a member of the New York Stock Exchange and has been nationally prominent since 1916, when President Wilson appointed him to the advisory committee of the Council of National Defense. Since that time he has been chairman of the commission on raw materials, minerals, and metals, commissioner in charge of raw materials for the War Industries Board; member of the commission in charge of all purchases for the Allies; chairman of the War Industries Board (appointed in 1918); member of the drafting commission of the economic section of the American Commission to Negotiate Peace; member of the Supreme Economic Council and chairman of the raw materials division; American delegate on economics and reparation clauses; economic adviser for the American peace commission; member of the President's conference for capital and labor (1919); member of the President's agricultural conference (1922); and trustee of the College of the City of New York. He was regarded as one of the ablest organizers of the war time. He is the author of many pamphlets, addresses, and *The Making of Economic and Reparation Sections of The Peace Treaty* (1920).

BASEBALL America's national game greatly strengthened its claim to popular favor during the 10 years ending with 1924. The attendance at the contests played by the many professional league clubs of the United States showed steady and at times sensational increases. The climax to a period of unprece-

dented growth in popularity came with the 1923 world series between the New York Americans, or "Yankees," of the American League and the New York Nationals, or "Giants," of the National League. These games were played in New York City before more than 300,000 persons, the total gate receipts amounting to over \$1,000,000.

The prestige that baseball enjoys at present is undoubtedly in large measure due to the rise in recent years of such star players as George Herman Ruth (q.v.), familiarly known to fandom as "Babe", Tyrus Raymond Cobb (q.v.), George H. Sisler, Edward T. Collins, Rogers Hornsby and others.

"Babe" Ruth stands out as the most powerful batter in the history of the game and at the same time as the greatest "gate" attraction the sport has ever known. The record of 59 home runs in a season which he established in 1921 seems destined never to be surpassed. The fame of Cobb, Sisler, Collins and Hornsby rests on their all-around playing, both at bat and in the field. Their names, too, provide the strongest of magnets at the major league turnstiles.

The onward march of professional, or "organized" baseball during the span from 1914 to 1924 encountered one serious check which threatened for a time to bring disaster. Following the world series of 1919 in which the Cincinnati National League team, the "Reds," emerged victorious over the Chicago American League team, the "White Sox," it developed that six of the Chicago players had been bribed by a coterie of big gamblers to "throw" the games. The effect of this disclosure was so wide-spread that the officials of organized baseball were finally compelled to make radical changes in the conduct of the game. The six offending Chicago players were blacklisted and Kenesaw Mountain Landis (q.v.), a Federal judge of Chicago, was chosen Commissioner of Baseball for a term of seven years, beginning with 1921. At the same time powers were conferred upon the Commissioner which constituted him practically a "czar." These drastic measures brought about the desired result. Public confidence was soon restored and baseball resumed its prosperous way.

A list of the pennant winning clubs in the National League during the period 1915-24 follows: 1915, Philadelphia; 1916, Brooklyn; 1917, New York; 1918, Chicago; 1919, Cincinnati; 1920, Brooklyn; 1921, New York; 1922, New York; 1923, New York.

The pennant winners in the American League were: 1915, Boston; 1916, Boston; 1917, Chicago; 1918, Boston; 1919, Chicago; 1920, Cleveland; 1921, New York; 1922, New York; 1923, New York.

The victors in the world series were: 1915, Boston Americans; 1916, Boston Americans; 1917, Chicago Americans; 1918, Boston Americans; 1919, Cincinnati Nationals; 1920, Cleveland Americans; 1921, New York Nationals; 1922, New York Nationals; 1923, New York Americans.

Aside from the United States, the country evincing the greatest interest in baseball during 1914-24 was Cuba, where several league circuits have been established. Japan, too, has taken up the game on an extended scale but in the nations of Europe the sport has made slow progress.

BASKERVILLE, CHARLES (1870-1922). An

American chemist, born at Deer Brook, Miss., and educated at the Universities of Mississippi and Virginia, Vanderbilt, and North Carolina. Beginning his teaching career in the University of North Carolina, he soon reached the professorial chair in chemistry. In 1904 he became professor of chemistry, and director of the chemical laboratory of the College of the City of New York; this position he held until his death. His studies on the rare earths led to the announcement of his discovery of the chemical elements carolinium and berzelium. He devoted much attention to the chemistry of anesthetics. In the industrial field he was active in the refining and hydrogenation of vegetable oils and established plastic compositions, besides succeeding in reinforcing metals. He also made studies on pulp and the paper industry, particularly with the branch relating to the recovery of used stock. The danger of various manufacturing processes and the best ways to meet and overcome these dangers received his careful consideration. In 1912 he received the Longstreth prize from the Franklin Institute. Baskerville was a fellow of the American Association for the Advancement of Science; he presided over the Chemical Section in 1903 and was chairman of the section of analytical chemistry at the International Congress of Applied Chemistry meeting in London in 1909. Nearly 200 papers, 8 books, and 16 patents testify to his scientific energy in the field of applied chemistry and to his effort to improve humanity.

BASKETBALL. Basketball added considerably to its popularity as a sport during 1914-1924, particularly among the colleges, high schools and Y. M. C. A. organizations. The games of the Intercollegiate League attracted as many as 2000 spectators on several occasions and some of the larger colleges were forced to enlarge greatly the seating capacity of their gymnasiums. Professional basketball also came into vogue and flourishing leagues were established in various sections of the United States.

One important change in the playing rules was adopted in 1917 which provides that the entire background of the court shall be regarded as within bounds, thereby giving the player an additional leeway of two feet under the basket. Another important change regarding personal fouls was made in 1923. The player fouled must "throw." A 17-foot zone was also established within which two free throws for fouls committed within the zone are allowed.

BASS, CHARLES CASSEDDY (1875-). An American physician, born at Carley, Miss. He studied medicine at Tulane University (1899) and afterward devoted himself to the study of bacteriology. He has done much original investigation in the intestinal parasites of man, notably hookworm, malaria, pellagra, Riggs' disease, etc. In recognition of his work in malaria he received gold medals from the State of Mississippi, the Southern Medical Association, and the American Medical Association. He is the author of *Hookworm Disease*, with G. Dock (1909); *Alveolodental Pyorrhœa*, with Johns (1915), and *Practical Clinical Laboratory Diagnosis*, also with Johns (1917).

BASRA. See MESOPOTAMIA.

BASSLER, RAY SMITH (1878-). An American paleontologist, born at Philadelphia

and educated at the University of Cincinnati. He served as private assistant to Edward O. Ulrich, from whom he obtained his early training in geology and palaeontology. In 1901 he became connected with the United States National Museum, in which since 1911 he has been senior curator of palaeontology. His advance studies were made in the George Washington University, where after 1904 he held the chair in geology. He served as special geologist on the State Geological Surveys of Virginia, Tennessee, and Maryland and has contributed to their reports volumes on local economic geology, stratigraphy, and palaeontology. His original investigations have been largely devoted to the stratigraphy and palaeontology of the Lower Palaeozoic and on fossil bryozoa, ostracoda, and other micro-organisms. With Ferdinand Canu he has published three quarto volumes on the Cenozoic Bryozoa of North America and made these early forms of life available for stratigraphic and economic purposes. He is a fellow of the Geological Society of America and in 1910 he became secretary of the Palaeontological Society of America.

BASTIN, EDSON SUNDERLAND (1878-). An American geologist, born at Chicago, Ill., and educated at Michigan and Chicago. In 1905 he became connected with the United States Geological Survey, serving in the division of mineral resources, and part of the time as its chief. In 1919 he returned to Chicago, where he later held the chair of economic geology. His original investigations have tended toward the study of economic resources of various parts of the United States and include discussions of questions concerning their origin.

BASUTOLAND. A British native protectorate in Southern Africa under the control of the British Colonial Office, administered by a resident commissioner under the direction of the high commissioner for South Africa. It has an area of 11,716 square miles. The census of 1921 showed a native population of 495,937; 1603 Europeans, 172 Asiatics, 1069 colored. Maseru, the capital, had 1890 natives and 399 Europeans. The increase in the European population over 1911-21 was inconsiderable because of prohibitions on white settlements. Education advanced steadily under missionary administration, in 1922 there being 495 native schools with 34,733 pupils. Exports, sent to South Africa, increased from £193,122 in 1908 to £1,380,119 in 1919. In 1922 exports were £69,330. Imports increased from £239,830 in 1908 to £1,137,037 in 1919. In 1922 imports were £702,125. Leading exports were grain, cattle, wool, mohair. Leading imports were blankets, ploughs, clothing, iron and tinware. The district supported its own administration, deriving its funds mainly from a native poll tax and customs. An income tax in 1922-23 brought in £3,755. Revenues in 1913-14 were £161,417, and expenditures £203,461; in 1922-23 these were £212,538 and £224,547. The native Basutos continued orderly during the period and many saw service in France and Africa in labor contingents. To the question of annexation by the Union of South Africa, however, they were consistently opposed.

BATAILLE, FELIX HENRI (1872-1922). A French playwright, one of the foremost figures of the French stage during the decade 1914-24, born at Nîmes, and educated at the Lycée Henri IV at Paris and the Lycée Janson de Sailly.

His first play, *La Belle au Bois Dormant*, was brought out in 1894, and his first great success came with his publication of *Maman Colibri* in 1904. Though the plot was rather repelling, *Maman Colibri* triumphed by the sheer charm of Bataille's art and the manner in which he idealized his heroine. *La Marche Nuptiale* (1905) was regarded by many as the best of his earlier works. A new side of his talent was displayed in *L'Amazone* (1917), inspired by the War. Its thesis was the struggle between the material and spiritual. There is in Bataille's plays the reflection of a distinct individual temperament. He was extremely sensitive to the sufferings of humanity, he scrutinized the human heart, he took the banalities of life and wrote of them as of his own intimate emotions; all this he did with dramatic results which, though morbid and over-sentimentalized, possess a certain charm and originality of treatment. In addition to the works mentioned, Bataille's publications include *La Lépreuse* (1896), a tragedy; *Ton Sang* and *L'Enchantement* (1900), *Paliche* (1906); *Les Flambeaux* (1912); *Le Phalène* (1913); *Notre Image*, and *Les Sœurs d'Amour* (1919); *L'Homme à la Rose* (1920), *La Tendresse* (1921), and *La Possession* (1922). He also wrote *La Chambre Blanche* (1895); *La Divine Tragedie* (1916), and *La Quadrature de l'Amour* (1920), all verse.

BATES, HENRY MOORE (1869-). An American lawyer, born at Chicago and educated at the University of Michigan and Northwestern University. After practicing law in Chicago, 1892-1903, he became Tappan professor of law at the University of Michigan and was made dean of the Law School there in 1910. In 1917-18 he was professor of law at the Harvard Law School and in 1921 he was appointed Commissioner on Uniform State Laws. He was president of the Association of American Law Schools (1912-13), a member of the Executive Committee of the American Institute of Criminal Law (1911-14), and president of the Order of the Coif (1913-16).

BATES, LINDON WALLACE (1858-1924). An American civil engineer (see Vol. II). Mr. Bates was chairman of the Engineering Committee of the Submarine Defense Association in 1917. He died at Paris on April 22, 1924.

BATES COLLEGE. A nonsectarian, co-educational institution at Lewiston, Me., founded in 1864. During the decade 1914-24 the student body increased from 450 to 626, the faculty from 33 to 40, and the endowment from \$800,000 to \$1,500,000. Bates claimed a unique record in the two fields of education and debating. Forty-six per cent of its more than 2600 living alumni were engaged in 1923-24 in teaching, and it provided more than twice as many high-school principals in New England as any other college. Bates was the first American college to send a debating team to England, and the first to debate an English university on this side of the Atlantic. From these beginnings grew a new institution of international collegiate debating. For 55 years there were but two presidents. The third president, Clifton Daggett Gray, Ph.D., LL.D., assumed office in May, 1920, following the death of George Colby Bates, D.D.

BATESON, WILLIAM (1861-1926). An English zoölogist, born at Whithy and educated at St. John's College, Cambridge. He was Silliman Lecturer at Yale University (1907); pro-

fessor of biology at Cambridge University (1908-09); Fullerton professor of physiology in the Royal Institution (1912-14; president of the British Association for the Advancement of Science (1914); director of the John Innes Horticultural Institution (1910-), and trustee of the British Museum (1922-). As the guest of the American Association for the Advancement of Science, he delivered the principal address at the meeting held in Toronto in December, 1921. His most important earlier researches dealt with various phases of the theory of evolution; the most important of the results appeared as *Materials for the Study of Variation* (1894). Since 1900, he was prominently identified with the Mendelian study of genetics and was regarded as the leading English authority on this subject, maintaining in opposition to the biometricians that only through the Mendelian technique could accurate results in heredity be obtained. Besides numerous shorter papers he published *Mendel's Theory of Heredity* (1902) and *Problems in Genetics* (1915). See BOTANY.

BATTALION. See ARMIES AND ARMY ORGANIZATION.

BATTISTI, CESARE (1875-1916). An Italian author and patriot, born at Trent, and educated at Vienna, Gratz, and Florence. He devoted himself to geographical science and particularly the history of the Trentino. When socialism made its appearance in Italy, he became an enthusiastic supporter. While editor of the Socialist daily, *Il Popolo*, he worked continuously for the autonomy of the Trentino, the cessation of Austrian interference, and subsequently the intervention of Italy against Austria. For his views he was many times imprisoned by Austrian authorities. In 1915 he entered the Italian army and a year later, while commanding a company of the Vicenza Battalion, was severely wounded. Reports followed that Battisti was taken prisoner by Austria and put to death for treason; that finding himself imprisoned within Austrian lines, he committed suicide; and finally, that wounded and half dead, he was hanged by the Austrians. Public indignation in Trent and Italy generally ran very high. Just what did happen has not been ascertained in spite of a photograph published by the *New York Times* showing Battisti walking unaided to his execution. He wrote *Il Trentino, Saggio di Geografia, Fisica e d'Antropogeografia*; *Termini Geografici Racolti nel Trentino*, and other volumes.

BATTLE CRUISER. See VESSEL, NAVAL.

BATTLESHIP. See VESSEL, NAVAL; ELECTRIC SHIP PROPULSION.

BATTLES OF THE FRONTIER. See WAR IN EUROPE, *Western Front*.

BAUCH, BRUNO (1877-). A German philosopher and Kantian scholar, born in Schleswig and educated at the universities of Freiburg, Strassburg, and Heidelberg. He studied mathematics, natural science, and philosophy and became associated with the neo-Kantian group of Hermann Cohen. His first work, *Glückseligkeit und Persönlichkeit in der Kritischen Ethik* earned him a reputation in philosophical circles. On the occasion of the Kantian anniversary he published *Luther und Kant* in 1904, and shortly afterward wrote a volume on Schiller. Among his other works are a philosophical biography of Kant and *Fichte und Unsere Zeit* (1920). Contrary to the tendency before the War, Professor Bauch presents Fichte as a cham-

pion of republican ideals and opposed to military Pan-Germanism.

BAUER, LOUIS AGRICOLA (1865-). An American magnetician (see VOL. II.) In 1917 he was a member of the National Research Council, and in 1917 and 1918 chairman of the committee on navigation and nautical instruments of the Council of National Defense. From 1920 to 1922 he was vice-chairman of the American Geophysical Union.

BAUER, OTTO (1881-). An Austrian Socialist politician. He was a member of the faculty of jurisprudence at the University of Vienna, where he devoted himself to the study of economics. Even during his student days he was an ardent advocate of the Social Democratic party. After being held a prisoner of war in Russia (1915-17), he returned to Vienna. In November, 1918, after the revolution, he became an influential leader of his party, bent on the union of German Austria with Germany. He retired from office in 1919 but subsequently was recognized, partly because of his thorough knowledge of economics, as a power in the Constituent National Assembly and in the National Parliament (Nationalrat). His works include *Die Nationalitätenfrage und die Sozialdemokratie* (Vienna, 1907); *Die Russische Revolution und das Europäische Proletariat* (1917); and *Bolschewismus oder Sozialdemokratie?* (1920).

BAUMANN, EMILE (1885-). A French novelist and critic. His work shows the influence of Bourget and Claudel. His novel, *Job le Prédestiné*, which shared the Prix Balzac in 1922, is mystical in spirit, like his much discussed *L'Immolé* (1921). His other works include *Le Baptême de Pauline Ardel* (1913); *Trois Vieilles Saintes* (1912); *Les Grandes Formes de la Musique* (1905); *Fosse aux Lions*, and *Le Fer sur L'Enclène* (1920).

BAUXITE. The production of bauxite, which is used largely for the manufacture of aluminium (q.v.), was 522,690 long tons, valued at \$3,156,610, in the United States in 1923, as compared with 219,318 long tons valued at \$1,069,194 in 1914. The 1923 production was an increase of over 72 per cent in quantity and 56 per cent in value as compared with the domestic production of 1922; in amount it equaled the largest annual domestic production before the War, the record output was 605,721 long tons valued at \$3,447,992 in 1918. The largest producer was the American Bauxite Company, whose plant was at Bauxite, Ark., where about 1000 tons a day were handled. Bauxite was also mined at other points in Saline and Pulaski Counties, Arkansas. In this Arkansas field the production increased from 266,790 long tons in 1922 to 493,880 in 1923. The operations in the eastern fields of Georgia, Alabama, and Tennessee became less extensive as the older deposits were worked out. The production which in 1917 had been 62,134 long tons fell from 42,800 long tons in 1922 to 28,810 long tons in 1923. The greatest decrease was in the Alabama districts, for the production of both Georgia and Tennessee was greater in 1923 than in 1922. The deposits in Alabama, Georgia and Tennessee produce 42,810 long tons in 1922. New deposits similar to those worked in Macon, Sumter, and Wilkinson Counties in central Georgia were opened in 1923 in east-central Alabama.

Most of the bauxite imported into the United States comes from South America, but France and Dalmatia also contribute and brought the

total importation for the year 1923 to 119,020 tons, as compared with 23,656 tons in 1922. The Bauxite received in the United States from South America came from British Guiana, where the Demerara Bauxite Company reopened its mines and completed its drying and loading equipment at Mackenzie on the Demerara River, 60 miles above Georgetown. This bauxite was used by manufacturers of aluminium and aluminium salts. In 1923 it was landed and sold at eastern markets more cheaply than domestic bauxite, even after the import duty of \$1 a ton had been paid, and its importation was seriously affecting the business of some domestic bauxite miners. A large drying and loading plant was erected on the Cottica River, 100 miles above Paramaribo, Dutch Guiana, from which bauxite was exported during 1924.

The record world production of bauxite in 1918 amounted to 962,876 metric tons. France headed the roll with some 145,000 tons. Dalmatia and Istria were other notable producers in that year. See ALUMINIUM.

BAUXITE PRODUCED AND CONSUMED IN THE UNITED STATES, IN 1923, IN LONG TONS

Year	Domestic production	Imports	Exports *	Apparent consumption
1923	522,690	119,020	78,560	563,150

* Largely bauxite concentrates.

DOMESTIC BAUXITE CONSUMED BY UNITED STATES INDUSTRIES, 1923, IN LONG TONS

Year	Aluminium	Chemicals	Abrasives and refractories	Total
1923	380,518	68,872	73,800	522,690

BAVARIA. During the War the well-known Bavarian particularistic tendencies were kept in check by a steadfast loyalty to the Empire, in spite of the fact that the enemies of Germany attempted to use these aspirations toward breaking the unity of the Empire. Upon assuming the office of German chancellor in November, 1917, Count Hertling was succeeded as Bavarian prime minister by von Dandl. The latter's offer of electoral reform, advanced in the Diet in October, 1918, came too late in the face of the German crisis. The November revolution of 1918 resulted in the deposition of the dynasty and the proclamation of the Republic. On November 8 the Soldiers' and Workers' Council in Munich elected the radical Socialist, Kurt Eisner, prime minister. Eisner wished to swing Bavaria far to the left and acceded to the urgent request for elections to the Bavarian Constituent Assembly only after he had provided in advance through ordinance for the establishment of a powerful Socialist government. The elections of Jan. 9, 1919, resulted in the following party divisions in the Assembly: Bavarian People's party (successor of the Bavarian Catholic Centre) 66, Socialists 62, Democrats 25, German People's party and German National party 9, Farmers' League 15. On February 21, the date of the convocation of the Assembly, Kurt Eisner was assassinated by a former army officer and in consequence a period of disorder and lawlessness ensued in which the official Socialist party and the provinces were at odds with the

Munich Soviets who attempted to usurp all power. After much conflict a new ministry was formed by the Socialist Hoffmann, and, in view of the threatening situation in the capital, the government and the Assembly were transferred to Bamberg in Northern Bavaria. Meanwhile the Munich revolutionary councils set up a Soviet republic which was ruthlessly suppressed, however, by the Hoffmann government and the provinces with the aid of the Prussian and Wurttemberg military during the first days of May, 1919, after one month of power in the capital. During the hard fighting between the two factions both sides committed barbarous excesses.

With the overthrow of the Soviets and the return of the Hoffmann government to Munich, the slow but steady process of reaction in Bavaria began. The rural sections of the country were opposed to the republican, Socialist, and anti-Catholic government in Munich, and to prevent future radical uprisings volunteer military organizations sprang up which were powerful instruments of reaction. At the time of the Kapp Putsch (March, 1920) the reactionary movement had progressed to a point where the Socialist government could be replaced by a bourgeois coalition under von Kahr, consisting of the Bavarian People's party, the Democrats, and the Farmers' League. The elections for the Diet on June 6, 1920, showed a further swing to the right, inasmuch as they resulted in the return of only 27 Majority Socialists, 22 Independent Socialists, and 2 Communists against 108 representatives for the bourgeois parties, most of whom re-entertained monarchist sentiments. Thereupon von Kahr reorganized his cabinet so as to include men more fully in sympathy with his own reactionary views. During 1921 the existence in Bavaria of secret military organizations in violation of the Versailles Treaty led to a serious dispute between the Berlin and Munich governments as a result of which von Kahr resigned on Sept. 12, 1921, and was succeeded by Count von Lerchenfeld. The new premier represented a more liberal viewpoint and reached subsequently a satisfactory agreement with the Government of the Reich. This turn toward moderation, however, was the result merely of pressure from without and had little effect on Bavarian reaction, which continued to grow daily in strength. The Lerchenfeld government found too little support in the country to cope with the secret military societies and the solid nationalist organization against treaty-enforcement and democracy. Moreover, Bavaria became a haven for all the extreme monarchist elements in Germany and henceforth all nationalist opposition to the Republic had its headquarters in Munich. In consequence of the activities of the Bavarian reactionaries, in 1922 the Reich came into conflict with the Allies. Count von Lerchenfeld, whose liberal tendencies lacked the support of the majority of the Bavarian people, was forced to resign early in November of the same year and a strongly monarchist government was formed by von Knilling with a programme of opposition to the fulfillment of the Peace Treaty. Under the influence of the reparation policy of the Allies and particularly of the developments in the Ruhr, Bavarian reaction and nationalism blazed forth in 1923 into a violent flame. The National Socialists with a programme of extreme nationalism and anti-Semitism sought refuge in Ba-

varia and under the leadership of Adolf Hitler formed activist organizations without interference from the Bavarian government. On Sept 26, 1923, the Knilling ministry suspended civil law and appointed von Kahr General State Commissioner with the powers of a dictator. Kahr and his lieutenant, General von Lossow, the commander of the Bavarian Reichswehr, took a stand against the laws and decrees of the Reich, especially against the "Law for the Defense of the Republic." A tense situation between Bavaria and the Reich resulted therefrom, which on the part of Bavaria took the form of direct refusal to recognize the authority of the Berlin government. Only the utmost caution and considerable sacrifice of principle on the part of the central government prevented open hostilities between the Reich and the recalcitrant state. To make matters even more complicated, the National Socialists under Ludendorff and Hitler executed on Nov. 8, 1918, their ludicrous "Beer Hall" Putsch. Kahr and Lossow, who at first had taken part in the affair but later claimed that they had been forced into such action by threats, suppressed the movement on the following day by military force and arrested the ringleaders. This procedure, however, by no means met with the approval of nationalist Bavaria and in consequence of his stand in the affair Kahr's position in the Diet was considerably weakened. Hence Kahr and Lossow resigned in February, 1924, and the full conduct of the government was again taken over by the Knilling ministry. During the following month the farcical trial of the perpetrators of the "Beer Hall" Putsch gave the world a fair view of the strength of nationalism in Bavaria. The elections to the Diet in April, 1924, resulted in a victory for the partisans of Hitler and in an increased representation of the Communists at the expense of the moderate parties and the Socialists.

On Aug. 14, 1919, Bavaria adopted a new constitution, which conformed with the provisions of the constitution of the Reich. According to this document the supreme power lay with the people. The executive power was vested in a ministry taken as a whole and the legislative power in a single-chamber diet, elected for four years by all Bavarian citizens, male or female, of 20 years of age, on the basis of one member for every 40,000 inhabitants. Provision was made for the application of the system of proportional representation and for equal, direct, and secret suffrage. Under the constitution of the Reich, Bavaria was shorn of its special military, financial, railroad, and postal privileges. Parallel with the growth of monarchism in Bavaria, demands were advanced early in 1924 for a revision of the German constitution so as to restore Bavaria's special privileges as well as for a reform of the country's own Fundamental Law with a view to erecting a bi-cameral legislature and limiting the franchise. These demands failed, however, to receive the indorsement of the Bavarian people in the April elections of 1924.

Resentment over the loss of the special privileges, and the wide differences between monarchist and Catholic Bavaria on the one hand, and republican and Socialist Germany on the other, stimulated Bavarian particularism anew in the years after the Armistice. Frequent mention was made of the possible secession of Bavaria from the Reich and the establishment of a Catholic monarchy, consisting of Bavaria and

the conservative sections of Austria, in opposition to radical and Protestant northern Germany. Accusations were made that French intrigues had been actively at work in this direction. Be that as it may, there can be little doubt that the separatist movement in the Rhenish Palatinate, which, parallel with the similar movement in the Rhenish Province of Prussia, came to a head late in 1923, was engineered by the French, as was conclusively proved by the quick disappearance of the "Republic of the Palatinate" early in 1924 as soon as France had withdrawn its active support. In conjunction with the demands for far-reaching constitutional changes in the spring of 1924, a proposal was made for the formation of a Catholic monarchy, to consist of Bavaria and the Tirol, but this, like the former demands, was rejected by the people in the April elections. Bavaria received an addition to her territory when on Nov. 30, 1919, the Thuringian city of Coburg voted by a large majority to join Bavaria. See RHINELAND.

BAWDEN, WILLIAM THOMAS (1875-). An American educator, born at Oberlin, Ohio, and educated at Denison University, the Mechanics Institute of Rochester, N. Y., and Teachers' College of Columbia University. After teaching in various schools, he was director of the Manual Training Department of the Illinois State Normal University (1903-10), assistant dean of the College of Engineering of the University of Illinois (1910-12), specialist in industrial education of the United States Bureau of Education (1914-19), and commissioner in 1919. He was chairman of the subsection on Industrial Education at the second Pan-American Scientific Congress (Washington, D. C., 1915-16). In 1909 he became editor of *Manual Training Magazine*.

BAX, ARNOLD (E. TREVOR) (1883-). A British composer, born in London. From 1900 to 1905 he studied at the Royal Academy of Music with Tobias Matthay (piano) and Frederick Corder (composition). He has written a *Festival Overture*; the symphonic poems *Into the Twilight*, *In the Fairy Hills*, *Christmas Eve on the Mountains*, *The Garden of Fand*, *November Woods*, *In Memoriam*, and *Tintagel*; choral works with orchestra, *Fatherland* and *Enchanted Summer*; a Symphony in E flat minor; chamber music, piano pieces, and songs.

BAYLISS, SIR WILLIAM MADDOCK (1860-1924). A British physiologist, born at Wednesbury, Staffordshire, and educated at Oxford and the University of London. He was appointed professor of general physiology in the University of London and with Harden edits the *Biochemical Journal*. He delivered the Herter lectures at the New York Academy of Medicine in 1922. He was very active during the War, in committee and research work on the treatment of shock, chemical warfare, and the food supply. His principal writings are *The Principles of General Physiology* (1915); *Nature of Enzyme Action* (1908); *Physiology of Food and Economy of Diet* (1917); *Intravenous Injection and Wound Shock* (1918); *Introduction to General Physiology* (1919); *The Vaso-motor System* (1923), and *Interfacial Forces and Phenomena in Physiology* (1923).

BAYREUTH FESTIVAL. See MUSIC, Festivals.

BAYS, ALFRED WILLIAM (1876-). An American lawyer, born at Vermont, Ill., and

educated at Knox College and the School of Law of Northwestern University. He was appointed lecturer at the university in 1905 and was advanced progressively until he became professor of law in 1912; at the same time he continued his general practice in Chicago. He is author and compiler of the *American Commercial Law Series*, 9 vols. (1911-12), *Cases on Commercial Law* (1914), *Commercial Law* (1919), and a second edition of the *Commercial Law Series*, 4 vols. (1920-22).

BAZIN, RENÉ (1853-). A French novelist and man of letters (see VOL. III). After 1914, he produced a half dozen novels besides miscellaneous writings. *Les Nouveaux Oberlé* (1919) is regarded as a masterpiece. It treats of a subject dear to the French heart, the patriotism of the Alsatians, a theme which the author handles in a simple manner. *Charles de Foucauld, Explorateur* (1921) is a magnificent biography of a notable French explorer. His other works include *Mémoires d'une Vieille Fille*; *L'Abandonné* (1914); *La Closerie de Champ-dolent* (1917); *Récits du Temps de Guerre* (1919); *Le Mariage de Mlle. Gmel*; *La Barrière*; *La Douce France*; *Histoire de Vingt-quatre Sonnettes*; and *Ferdinand Jacques Hervé Bazin* (1921).

BEAL, ALVIN CASEY (1872-). An American floriculturist, born at Mt. Vernon, Ill., and educated at Illinois and Cornell University. From 1900 to 1908 he was instructor of floriculture at the University of Illinois, and in 1909 he became professor of floriculture at Cornell. He was a member of many floricultural societies and wrote numerous research bulletins and articles.

BEAL, GIFFORD REYNOLDS (1879-). An American painter, born in New York, who studied with Chase, DuMond and Ranger. He was elected an Academician in 1914, and he took prizes at the Academy in 1910, 1913 and 1919. In 1913 he took a medal at the Art Institute of Chicago and at the Corcoran Gallery, and in 1915 he was awarded a gold medal at the Panama-Pacific International Exposition at San Francisco. Among his many awards is included the gold medal of the National Arts Club (1918). Beal is a versatile colorist. His subjects are taken from many fields and moods. His circus pictures had a peculiar *réclame*. Of another genre are his garden scenes, peopled with ladies in crinolines and dandies of long ago. Later pictures show gain in organization. His best known work includes "Mayfair" and "The Albany Boat," in the Metropolitan Museum (New York), and "A Puff of Smoke," in the Art Institute (Chicago). He is represented also in the Syracuse, San Francisco, and Detroit Museums.

BEARD, CHARLES AUSTIN (1874-). A prominent American historian and publicist (see VOL. III). After 1914, Mr. Beard's work assumed increasing importance. His insistence on the part played by economics in the development of America's institutions was recognized by American scholars as a major contribution to historical thought. He projected an ambitious study of the interrelations between politics and economics in American life, with *The Economic Interpretation of the Constitution* (1913) and a continuance of its story in *The Economic Origins of Jeffersonian Democracy* (1915). These works not only received the commendation of scholars but also were read widely, for Mr.

Beard's stylistic talents are considerable. These factors enhanced the popularity of his other works; his *Contemporary American History* (1914) and *The History of the United States* (1921), are used as general texts by schools throughout the country. In 1917, he gained great prominence for his fight for academic free speech, his resignation from Columbia University was a protest against the dismissal of two of his colleagues. His interest in contemporary social and educational problems then led him to affiliate himself with the Bureau of Municipal Research (New York) and later with the New School for Social Research. He wrote prolifically on many historical and allied themes, his works including the excellent *Economic Basis of Politics* (1922) and *Cross Currents in Europe To-day* (1922), besides many textbooks for schools. Of these the more important are *National Governments* and *The World War with F. A. Ogg* (1919), and *History of the American People, with W. C. Bagley* (1918).

BEARD, MARY RITTER (Mrs CHARLES A.) (1876-). An American writer and suffrage leader, born at Indianapolis and educated at DePauw and Columbia Universities. She was editor of *The Woman Voter* until 1912, a member of the executive committee of the Congressional union for Woman Suffrage, and former vice-chairman for Manhattan of the Woman Suffrage party of New York. She is the author of several excellent historical surveys, *American Citizenship*, with her husband (1913), *Women's Work in Municipalities* (1915), *A Short History of the American Labor Movement* (1920), a useful and readable summary; and *History of the United States* (1921).

BEAR ISLAND. A desolate Arctic land about 200 miles north of Norway, which claims it. Extensive deposits of coal led to the belief that it would be economically valuable, and a temporary colony was established for mineral exploitation, but its further development was unpromising owing to the superior mining facilities in Spitzbergen (q.v.)

BEATTY, DAVID BEATTY, first EARL OF (1871-). A British admiral born in County Wexford, Ireland. He began a meteoric career in the navy in 1884. He served with the Nile flotilla in 1896; participated in the advance on Peking in 1900; acted as aide-de-camp to Edward VII in 1908 and as naval secretary to the First Lord of the Admiralty in 1912, when he was made commander of the First Battle Cruiser Squadron. The outbreak of the War gave him the opportunity which all naval men traditionally crave. He distinguished himself in the naval battles of Heligoland Bight (Aug. 28, 1914), Dogger Bank (Jan. 24, 1915), and Jutland (May 31, 1916), where his direction of the battle cruisers was characterized by a spirit and enterprise which gained universal commendation. In December, 1916, he was raised to the post of Commander-in-Chief of the Grand Fleet, in succession to Sir John Jellicoe. In 1919 he received a peerage, the Order of Merit, and the position of First Sea Lord. He married, in 1901, Ethel Field, the daughter of the American, Marshall Field.

BEATTY, EDWARD WENTWORTH (1877-). A president of the Canadian Pacific Railway Company, born at Thorold, Ont., and educated at Upper Canada College, the Model School of Toronto, Harbord Collegiate Institution (To-

ronto), Toronto University, and Osgoode Hall Law School. After reading law in a Toronto office, he was called to the Ontario Bar in 1901, and in the same year was appointed assistant in the law department of the Canadian Pacific Railway. He became assistant solicitor in 1905, general solicitor in 1910, general counsel in 1913, vice-president in 1914, King's counsel for Ontario in 1915, King's counsel for the Dominion in the same year, and director of the company in 1916. He was constituted a member of the executive committee in 1916 and was elected president in 1918. Other offices which he holds are those of director of the Bank of Montreal, director of the Royal Trust Company, chancellor of Queen's University and of McGill University, and trustee of Royal Victoria Hospital.

BEAUX, CECILIA (?-). An American painter (see VOL. III). She won the Saltus medal from the National Academy of Design in 1914; medal of honor from the Panama Pacific International Exposition (1915); the Proctor portrait prize from the National Academy of Design (1915); the National Arts Club prize of the N. A. Women Painters Society (1917); and the Logan medal from the Art Institute of Chicago in 1921.

BEAUX-ARTS INSTITUTE OF DESIGN. This institute was organized in 1916 by members of the Society of Beaux-Arts Architects who had formerly attended the Ecole des Beaux-Arts of Paris. It was formed in order to carry on the educational work which had developed from the original social club of the Society of Beaux-Arts Architects. The main courses were in architecture, but this was supplemented by important courses in sculpture, mural painting and interior decoration. The institute now serves as a clearing house for advanced architectural design in the majority of big architectural schools in the United States, from California to New York, and its number of pupils has increased from about 1100 in 1914 to 1500 in 1924. Building, 126 East 75th Street; Director, Whitney Warren, 16 East 47th Street, New York, N. Y.

BECHUANALAND. A British native protectorate in South Africa under control of the British Colonial Office, administered by a resident commissioner under the direction of the high commissioner for South Africa. It has an area of 275,000 square miles, and a population (census of 1921) of 152,983 of whom 1743 were Europeans. The most important city is Serowe; population, 20,000. The native peoples were a pastoral folk for the most part, and exported cattle and skins to South African markets, notably Kimberley, Johannesburg, and Mafeking. The mines of the Tati District produced 6005 ounces of gold and 1317 ounces of silver in 1922. Administrative costs consistently increased, expenditures in 1913-14 being £66,749, and in 1922-23, £82,436. In the three years 1919-22, expenditures exceeded revenues and imperial grants were necessary to meet the deficit. In 1922-23, revenue exceeded the expenditure by £9559. The protectorate belonged to the South African Customs Union and no figures for local trade were kept. There were 12 schools for Europeans, attended by 178 children; one for colored; and 66 native schools with an attendance of 4183 children.

BECK, JAMES MONTGOMERY (1861-). An American lawyer and author, born at Phila-

delphia, and educated at Moravian College. He was admitted to the bar in 1884. He was United States Attorney for the Eastern District of Pennsylvania (1896-1900), assistant attorney-general of the United States (1900-03), and member of the law firms of Shearman & Sterling, New York (1903-17), and of Beck, Crawford and Harris, New York (1917-21). In addition he has held the positions of trustee and bank director, and in 1921 was solicitor-general of the United States. He is the author of several works on international relations, with searching analyses of the problems of war and peace. *The Evidence in the Case* (1914) discusses the question of responsibility for the War, with a condemnation of Germany. *The War and Humanity*, with a foreword by Theodore Roosevelt (1916), is a brief for world coöperation. *The Reckoning* (1918) is a discussion of the moral aspects of the peace problem, and *The Passing of the New Freedom* (1920) is a satire on President Wilson. He is also author of *The League of Nations* (1919) and *The Constitution of the United States*, with a preface by the Earl of Balfour (1923).

BECKER, ALFRED LE ROY (1878-). An American lawyer, born in Buffalo, N. Y., and educated at Harvard and Buffalo Universities. He practiced law in Buffalo, 1902-14, and later became deputy attorney of the State of New York (1915-19). He attained a nation-wide reputation during the years 1917 to 1919 for his investigation and exposure of German plots and propaganda. He is known as a lecturer on Dutch history in New York, at the Brooklyn Institute of Arts and Sciences.

BECKER, CARL LOTUS (1873-). An American historian, born in Blackhawk County, Iowa, and educated at Wisconsin and Columbia Universities. He taught history successively at Pennsylvania State and Dartmouth Colleges and Kansas, Minnesota, and Cornell Universities. He became professor of history at Cornell in 1917. In 1915 he was made a member of the board of editors of the *American Historical Review*. A student of Frederick J. Turner, he has inherited much of his master's historical philosophy and literary style, writing works characterized by technical skill and, what is rare in historical activity, good style. His most successful works in this respect have been *Kansas in the Turner Essays* (1910), *Beginnings of the American People* (1915), and *The Eve of the Revolution* (1918). The latter is easily one of the best of the *Chronicles of America* series. It not only possesses a proper sense of the underlying values, but also catches, with a sophistication comparable only to the French method, the flavor of the American scene in 1776. His study, *The Declaration of Independence* (1922), displays the same technique in intellectual history. His other works include *The United States, an Experiment in Democracy* (1920), *America's War Aims and Peace Terms* (1918), and many monographs on the French Revolution, which is the theme of his principal seminar.

BECKETT, PERCY GORDON (1882-). An American mining engineer, born in Quebec, Canada, and educated at Fettes College, Edinburgh, and at the School of Mines at Camborne, Cornwall. He served as superintendent and engineer of several important mining corporations. From 1908 to 1912 he was engineer for Phelps, Dodge and Company in Arizona, and was gen-

eral manager of the Old Dominion Company at Globe, Ariz., from 1912-17. He became general manager of the Phelps, Dodge Corporation in Arizona in 1920.

BECKHAM, J. CREPPS WICKLIFFE (1869-). An American senator, born at Bardstown, Ky., and educated at the Central University of Kentucky. He was admitted to the Kentucky bar in 1893. In 1894 and 1896-98, he was a member of the Kentucky House of Representatives, and was Speaker in the latter year. From 1900 to 1907, he was the governor of Kentucky. He was a member of the United States Senate, 1915-21, and a delegate-at-large and member of the Committee on Resolutions of the Democratic National Convention in 1904, 1908, and 1912; he was delegate-at-large in 1916 and 1920.

BEDFORD-JONES, HENRY JAMES O'BRIEN. (1887-). An author, born at Napanee, Ont., and educated at Trinity College (Toronto). He collaborated in *The Boys' Big-Game* series, *The Boy Scouts of the Air* series, and *The Captain Becky* series (1912). Besides contributions to magazines he has written *Gathered Verse* (1916), *L'Arbre Croche Mission* (1917), *The Mesa Trail* (1920), *The Shadow* (1922), and *Canada*, 1695 (1922).

BÉDIER, CHARLES-MARIE-JOSEPH (1864-). An eminent French scholar. He was born in Paris, and after teaching in the faculties of Fribourg and Caen succeeded Gaston Paris at the Collège de France (1903) as professor of mediæval French language and literature. He was twice sent on missions to the United States (1909 and 1913) to organize a system of exchange of professors in French and American universities, but the War interrupted this work. As a scholar he unites minute scientific accuracy with sure literary insight as is shown in the introduction to his edition of the *Lai de l'Ombre* (1892), *Les Fabliaux* (1893), and *Les Légendes Épiques*, 4 vols. (1908-13). In the *Lai de l'Ombre* he opposes the mechanical German method of text constitution. The *Légendes Épiques* is a monumental work in which he refutes the old theory of the origin of epic poems and proves that they are products of the age in which they were first written down, not the oral heritage of an earlier period. His *Tristan et Iseut* (1900) is an adaptation of the ancient story, based on all the extant mediæval versions in every language. The collating of these numerous texts was done with painstaking care. During the War, Bédier abandoned his scholarly work and published several arraignments of Germany. *L'Effort Français* is the best known of these. Finally, as a fitting successor to his list of learned works, comes a definitive edition of the oldest French masterpiece, the *Chanson de Roland*, in preparation (1924). He has also written *Colin Muset*, a Latin thesis (1893); *Études Critiques* (1903); *Roman de Tristan par Thomas*, 2 vols. (1903-05); *Deux Poèmes de la Folie Tristan* (1907); *Chansons des Croisades* (1909), and two pamphlets *Comment l'Allemagne Essaie de Justifier Ses Crimes* (1915) and *Les Crimes Allemands d'après des Témoignages Allemands* (1915). In 1917 he was attached to the information service at general headquarters. He was elected to the French Academy in 1920 and is one of the directors of the *Revue de France*. In the summer of 1923 he was one of the French delegation of university

professors at the Summer School of Columbia University and in that year and in 1924 was engaged in editing an elaborate history of French literature.

BEEBE, (CHARLES) WILLIAM (1877-). An American ornithologist, explorer and essayist. (see VOL. III). He is the author of *A Monograph of the Pheasants*, an elaborate work in four volumes, the first of which appeared in 1918 and the second in 1921, and *Galapagos: World's End* (1924). He also wrote essays founded on his observations in the tropics. Most of these appeared in the *Atlantic Monthly*.

BEECHAM, SIR THOMAS (1879-). A British orchestral conductor, born at Liverpool. While pursuing regular academic studies, he was instructed in music by private teachers. In 1899 he formed at Huyton an amateur orchestra which he conducted for three years and which gave him sufficient practical experience to accept, in 1902, a post as conductor with Truman's Opera Company. At the conclusion of the tour he devoted an entire year to further serious study and then appeared, in 1905, as a full-fledged symphonic conductor with the Queen's Hall Orchestra. The following year he founded the New Symphony Orchestra, which he conducted till 1908, when he formed the Beecham Symphony Orchestra. In 1910 he gave at Covent Garden a season of grand opera, conducting personally an extensive repertoire and arousing great enthusiasm by the excellence of the performances, to which his own splendidly drilled orchestra largely contributed. This success induced him to continue his career as impresario until 1920, when he suddenly retired from all musical activity. He emerged from this voluntary retirement just as suddenly in 1923, when he appeared as conductor of the Hallé Orchestra in Manchester. During the season 1915-16 he was also conductor of the London Philharmonic Society. He was knighted in 1916. Among the important novelties which he introduced to England are R. Strauss's *Feuersnot*, *Salome*, *Elektra*, *Rosenkavalier*, and *Ariadne auf Naxos*; d'Albert's *Tiefland*; Rimsky-Korsakov's *Le Coq d'Or*; Delius's *Romeo and Juliette in the Village*; Leroux's *Le Chemineau*; Holbrook's *Dylan*; Lehmann's *Everyman*; and Stanford's *The Critic*.

BEEF. See LIVE STOCK.

BEEHIVE COKE. See COKE.

BEER, EDWIN (1876-). An American surgeon, born in New York, and educated at Columbia University. Among his hospital appointments have been Bellevue and Mt. Sinai. He has been a prolific writer on surgery of the male urinary organs and in 1910 first described what was originally known as Beer's method of treating tumors of the bladder by the high frequency current applied through the natural passages. His great success with this method led to its general adoption by genito-urinary surgeons. He has also published many papers on abdominal surgery.

BEER, GEORGE LOUIS (1872-1920). An American historian (see VOL. III). He served with distinction on the American Commission to negotiate Peace (1919), in control of Colonial affairs. On the formation of the League of Nations he was made director of the mandatory section of the League's secretariat. His untimely death robbed the League of one of its most enlightened champions. Friends collected

his important papers in 1923 under the title of *African Questions at the Peace Conference*.

BEER, THOMAS (1889–). An American writer, born at Council Bluffs, Iowa, and educated at Yale and Columbia Universities. He served in the War (1917–18) and has contributed short stories to *The Century*, *Saturday Evening Post*, *Smart Set*, etc. In 1922 he published *The Fair Rewards*; in 1923, *Stephen Crane: A Study in American Letters*, and in 1924, *Sandoval*, a novel.

BEEBLE, JAPANESE. See ENTOMOLOGY, ECONOMIC.

BEHAN, RICHARD JOSEPH (1879–). An American surgeon, born at Pittsburgh, Pa., and educated in medicine at the university there. He is known for his extensive monograph *Pain* (1914), the most complete work ever written on the subject. Profusely illustrated, it deals with pain as a symptom of disease, injury, and derangement. In the second Balkan war he served as a surgeon at the Fourth Reserve Hospital in Serbia. He was surgeon of St. Joseph's Hospital, Pittsburgh (1914–19).

BEHAVIORISM. A school of psychological doctrine developed in recent years under the leadership of the American psychologist, Prof. John B. Watson. Its central idea is to regard psychology as a scientific study of behavior and to explain behavior as a system of responses to stimuli. The topic of behaviorism in 1924 occupied the forefront of psychological polemic and had divided Anglo-American psychologists into two camps, the behaviorists and the anti-behaviorists. In the United States, the psychologists styling themselves behaviorists were said to constitute a numerical majority, but as there exist among them infinite variations of doctrine, ranging from Watson's own statement in his *Psychology from the Standpoint of a Behaviorist* (1919) to the mere use of certain behavior concepts, this is not as significant as it may seem.

Behaviorism may be best understood as a somewhat impatient attempt to make psychology a science like other sciences regardless of the peculiar complexity of mental phenomena. It is a reaction against the slow methods of experimental introspection developed by Wundt and Titchener, and against the so-called subjectivistic ideology imported from idealistic philosophy. It is therefore a revolt in the direction of empiricism and objectivity. The method of behaviorism was evolved from animal psychology. In 1906 there was published in Paris a book by Kostylef on the present crisis in psychology. In it the author portrayed what he regarded as the theoretical breakdown of experimental psychology, and showed that individual experimentation had outrun the capacity of the science for synthesis. The number of experimental papers accumulated in the United States alone defied any effort at integration.

As a remedy to this disorganization, Kostylef held up the conditioned reflex theory developed by the Russian physiologists Pavlov and Bechterev—a theory which would transform psychology into an objective science. What was this conditioned reflex? When food is exposed to a dog, his mouth begins to salivate. This is called a reflex action. Now the same dog can be made to salivate when food is exposed and a gong rings at the same time. After the sound of the gong and the exposure of the food has been imposed upon the dog's attention at

repeated intervals, the food can be withdrawn altogether, and the salivation reflex will be induced by the sound of the gong alone. This conditioned reflex will function only a short length of time—about a month, unless its association with the simple reflex is renewed.

In this conditioned reflex and in the formation of new habit responses, Kostylef saw the hope of developing a completely objective psychology which would explain even the most complex human activities. In retrospect we may say that we had here the essentials of the behaviorist programme without the label of behaviorism. The behaviorist movement, however, did not crystallize until the work of Pavlov and Bechterev was translated and made available in English and German, and was combined with the already thriving animal psychology studied by Thorndike, Washburn, Jennings and Watson. The behavior articles of Watson began to be published about 1913 and soon attracted a following to the new point of view, as well as bitter criticism from the camp of the introspectionists.

First and foremost the behaviorist viewpoint is a challenge to the traditional preoccupation of psychology with consciousness. Historically modern psychology developed out of the empirical movement in philosophy—Locke's quest for the origin of ideas. The first fundamental theory of psychology was the association of ideas or sensations. As the technique of physiology was perfected, the associationist psychology was modified into a physiological psychology, with the hypothesis of psycho-physical parallelism as the theoretical bridge. Mental phenomena as introspectively reported were correlated with the physical or physiological stimuli, and thus the progress of the science was made to depend on two factors: the perfection and precision of laboratory apparatus and introspective training on the part of the observer. The latter factor was the weak spot of this school of psychology (generally known as structural psychology). Introspection could never be made precise enough to compare with the mathematical delicacy of physical and physiological technique, and moreover, there was the additional difficulty of passing from conscious states to conscious action.

On the other hand biology approached the study of animals and man precisely through the notion of individual action for the protection of the organism, and it is from biology that the idea of instincts, or inherited modes of action, and reflexes or acts automatically induced by stimuli, were developed and passed on to psychology. The difficulty here was just the reverse, how to pass from acts to consciousness. The concept of the struggle for existence, with its ambiguous connotation of mechanism and conscious reflection, has often been made to serve as a connecting link between activity and thought. Around this concept has grown the school of psychology known as functionalism—implying that psychic activity is a unified function of the individual in his biological struggle. The best representative of this psychology in America was William James, who incidentally derived his pragmatic philosophy largely out of the same motif. Where the structuralists sought microscopic precision through introspective analysis, the functionalists slurred over details for the benefit of a sweeping gesture.

In animal psychology (q.v.) none of the problems of introspective analysis are present

for the simple and sufficient reason that we cannot ask animals to introspect. The method of procedure is necessarily objective, being confined to a study of external behavior in correlation with the stimulus or situation set by the experimenter for the animal. However, if the observation is objective, the interpretation of results, or for that matter the setting of the experiment, betrays a reference to the introspective consciousness of the human individual.

No experimenter can regard the animal as a dumb mechanism in spite of the fact that the response to stimulus is in many cases almost automatic. And the very existence of the conditioned reflex leads to problems almost as puzzling as the association of ideas in man. But just as the early associationists took the association of ideas to be a mechanical affair, regulated by such conditions as contiguity, frequency, etc., so many of the animal psychologists look upon the conditioned reflex as if it were an automatic mechanism.

Under ordinary conditions the adoption of the technique of animal psychology to explore the complexities of the human mind would be regarded as an attempt to explain the obscure by the more obscure. But the ground had already been prepared for throwing out consciousness from human psychology. As one wit put it, after losing its soul, psychology was to lose its mind. In 1904 James led a polemic against the belief in the existence of consciousness as an entity. He was ready to grant a functional existence to it, but would have nothing to do with "the hypothesis of a trans-empirical reality." Those who still cling to consciousness, he said, "are clinging to a mere echo, the faint rumor left behind by the disappearing 'soul' upon the air of philosophy. . . . The healthy thing for philosophy is to leave off grubbing underground for what effects effectuation or makes action act."

Another influence which favored the rise of behaviorism was the pressure of American life in the direction of an empirical applied psychology, or a psychology of individual capacities. Here, too, biological functionalism was the implicit theoretical assumption, but the use of statistical methods prevented any grievous errors. In the case of behaviorism, the appeal presented is not that of the actuary, who predicts future cases by comparison with the tabulated instances of the past: it is rather the appeal of system. Human activity is explained in a quasi-mechanical manner as the play of instincts, reflexes, habits. Sensation and perception are abolished, and thought is reduced to the status of an implicit language habit. Red, yellow, blue are no longer regarded as visual sensations or after images, but are responses to the respective physical stimuli.

This oversimplification has been criticized by many psychologists who wish to remain behaviorists. Thus Prof. John Dewey wants to find room for value and purpose concepts, and the neo-realists who first welcomed the new psychology because it eliminated that "alien influx into nature," consciousness, have found much difficulty in explaining purpose behavioristically. It must be admitted, however, that other systems of psychology, including structuralism, have shared this difficulty of explaining moral ideas.

The legitimacy of the behavioristic scheme has been attacked on strictly scientific grounds by

Boring in a paper on the "Stimulus Error." In introspective psychology, he writes, it has been customary to distinguish between attention to the stimulus and attention to the sensation of subjective reaction produced by the stimulus. The behaviorists, in common with the capacity psychologists, refuse to recognize the stimulus error (judgment about the stimulus instead of the sensation) and correlate all responses in the same column. Now it is possible, he holds, to demonstrate experimentally the existence of an equivocal correlation if the subjective dispositions are neglected. A more popular illustration of the same argument can be cited in the difficulty of explaining hallucination in behavioristic terms.

Outside of psychology, behaviorism has received support from pragmatism because of the similarity of emphasis on action, and from neo-realism for its realistic empiricism. The rationalists and idealists, however, regard behaviorism as a simple variety of materialism. Their opinion is best represented by Lovejoy who raises the "Paradox of the Thinking Behaviorist." See *INSTINCT; ACTION; CONSCIOUSNESS AND THE UNCONSCIOUS; PSYCHOLOGY, GENERAL*.

Consult: J. B. Watson, "Psychology as the Behaviorist Sees It," *Psych. Rev.* vol. xx (1913); *Behavior* (1914); *Psychology from the Standpoint of a Behaviorist* (1919). Roback's *Behaviorism and Psychology* (1922) is a polemic against Behaviorism, and may be used as a guide to the discussions in the psychological periodicals.

BETH, IAN HAY (1876-). An English writer, under the pen-name of Ian Hay. He was educated at St. John's College, Cambridge. His books, written in a humorous vein, became widely popular. They include *The Right Stuff* (1908); *A Man's Man* (1909); *A Safety Match* (1911); *Happy-Go-Lucky* (1913). He served during the War in the Argyll and Sutherland Highlanders, rising to the rank of major. His book *The First Hundred Thousand* (1915), was one of the most widely read volumes relating to the War. His later books include *The Willing Horse* (1921), *A Baker's Dozen* (1922). He lectured much in the United States and in 1923 became an American citizen.

BEKHTEREFF, V. G. VON. See **BECHTEREV, V. G. VON.**

BEKKER, LEANDER J. DE (1872-). An American editor, born in Kentucky. From 1897 to 1919 he was identified with such various publications as *Carter's Magazine*, the *New York Evening Post*, and the *New York Tribune*. As the editorial correspondent of the *Tribune* (1919), he led the opposition to Mexican intervention. He was confidential assistant of the United States War Trade Board and in 1914 was one of the founders and the first president of La Ligue des Pays Neutres. He became secretary of the Writers' Publishing Company in 1915 and president in 1921. His works include *The Stokes Encyclopedia of Music and Musicians* (1908, 1910, 1912), and *The Plot against Mexico* (1919). He edited *Hoyt's New Practical Cyclopædia* (22d ed.)

BELASCO, DAVID (1859-). An American playwright and manager (see Vol. III). As firm a believer in old conventions now as ever, Belasco has lengthened his career with such popular successes as *Polly with a Past* (1917), *Tiger Rose* (1917), *Daddies* (1918), *Tiger! Tiger!* (1918), *The Gold Diggers* (1919), *De-*

bureau (1920) and *Kiki* (1922). An extravagantly costly revival of *The Merchant of Venice* (1923) roused a stormy critical discussion. Mrs Fiske came under his direction in *Mary, Mary, Quite Contrary* (1923).

BELGIAN CONGO. See COPPER.

BELGIUM. A kingdom of western Europe, bordering on the North Sea, between France and the Netherlands. Belgium has an area of 11,752 square miles, with a population of 7,539,568 on Dec. 31, 1922, giving an average density of 642 persons to the square mile; the greatest of any whole nation, though portions of other countries may be more thickly populated. In spite of war losses, the population of Belgium (exclusive of the small territories annexed by the Treaty of Versailles) decreased by only 22,431 between 1910 and 1920, and was after that increasing at the rate of about 60,000 per year. The country was highly industrialized with 1,600,000 engaged in industrial pursuits and an agricultural population of 1,200,000 of whom 800,000 were actually engaged in agricultural work. The principal city and capital, Brussels, on Dec. 31, 1921, had a population of 775,000. The chief port, Antwerp, had 304,000 people, while Liège and Ghent possessed each a population of 165,000. Between 1910 and 1920, the last two years for which complete census figures are available, the number of persons speaking French only increased from 2,833,334 to 2,855,835, the number speaking Flemish only fell from 3,220,662 to 3,187,073, and those speaking German only from 31,415 to 16,877. Before the War, immigrants entering Belgium each year slightly exceeded emigrants from the country, but afterward the situation was reversed, and in 1921 immigrants numbered 24,389, compared with 27,443 emigrants. With the economic recovery of Belgium, the excess of emigrants was gradually diminishing, and the former situation seemed likely to return in a few years. The movement of population was greatest between Belgium and France, followed by the Netherlands and the United States.

Education. The educational system was becoming constantly more highly organized; the number of primary schools increased from 22,915 in 1913 to 29,210 in 1921, and the number of pupils rose from 939,285 in 1913 to 955,365 in 1920. Besides these, there were 3217 primary schools for adults, with 117,833 pupils, and 3422 infant schools with 154,032 pupils in 1920. In schools of intermediate grade there were 56,056 pupils in 1921, compared with 39,081 in 1913. Above these schools are the four universities (Ghent, Liège, Brussels, and Louvain), several technical and commercial institutions, three military schools, a school of veterinary education, a colonial school and an agricultural institute. The number of pupils in the universities rose from 8532 in 1913-14 to 9329 in 1920-21. No illiteracy statistics have been compiled since 1910, when the proportion was 14.1 per cent.

Industry. Despite the predominantly industrial character of the country, Belgian agricultural production was of considerable importance. The acreage of various crops returned practically to normal in the post-war years, but the emphasis was now more on sugar and forage beets, and other forage crops, than before the War. The accompanying table gives a comparison of the principal kinds of agricultural products in 1913 and 1923.

AGRICULTURAL PRODUCTS IN BELGIUM

CROP	1913		1923	
	(Acres)		(Metric Tons)	
Wheat	394,134	345,486	401,950	364,028
Rye	641,173	573,346	570,694	528,017
Barley	84,105	84,700	91,808	91,047
Oats	671,371	653,831	696,094	683,028
Sugar beets	129,525	178,976	1,394,917	2,036,518
Forage beets	176,464	188,298	4,554,467	4,300,280
Potatoes	383,082	376,589	3,200,932	2,822,212
Forage crops, not including pasture land	926,598	957,873	1,894,070	1,854,733

Mineral production was always an important item in Belgium. The country has as natural resources supplies of coal and zinc, and after the economic union with Luxemburg in 1922 gained ready access to supplies of iron ore. Immediately after the War resumption of metallurgical activity was initiated and by 1923 production had practically reached the pre-war level, except zinc production, which advanced more slowly. The accompanying table shows the progress made in 1923, compared with the previous year, and also reveals the approximation of pre-war conditions.

BELGIAN COAL, IRON AND METALLURGICAL PRODUCTION

	(Metric Tons)		
	1913	1922	1923
Coal	22,841,590	21,234,170	22,916,070
Coke	3,523,000	2,707,490	4,156,700
Agglomerates	2,608,640	2,477,160	1,931,050
Pig iron	2,484,690	1,603,620	2,188,130
Raw steel and rough casting	2,465,904	1,463,640	2,285,910
Finished steel	1,859,064	1,409,990	1,943,390
Finished iron	304,344	180,252	207,740
Zinc	204,156	113,136	148,080

Belgian glass production, an extremely important industry in the country, made rapid strides in the post-war years, approaching pre-war volume in window glass and surpassing it in other lines. Production of window glass was 41,708,667 square meters in 1913, 33,708,000 square meters in 1922, and 37,000,000 square meters in 1923. Plate-glass production increased from 2,444,575 square meters in 1913 to 3,200,000 square meters in 1922, and 4,500,000 square meters in 1923. Bottle and glassware making increased greatly in importance since the war, new factories for the former being opened at Lommel, Moll, Selzaete and Jumet. The textile industry of Belgium was of paramount importance and was operating on practically the same scale as before the War. The number of cotton spindles in the country was 1,682,965 on July 31, 1923, compared with 1,518,134 on Mar. 1, 1914. Production, which totaled 48,000 metric tons in 1913, was as low as 43,125 metric tons in 1922, but rose to 51,000 metric tons in 1923. The woolen industry with approximately 625,000 spindles in operation, both before the War and in 1923, was also active; 27,578 metric tons were conditioned in 1913, 35,560 metric tons in 1922, and 30,000 metric tons in 1923, notwithstanding an important strike in the early part of last year. The flax, hemp and jute industries were operating 300,000 spindles in 1923, compared with 280,000 spindles before the War.

The unemployment situation in Belgium practically ceased to be a problem. On Dec. 31, 1921, there were 86,093 unemployed; by Dec. 31,

1922, this number was reduced to 26,055 and later changes were slight and largely seasonal. On Dec. 31, 1923, there were 23,450 unemployed in the country.

Commerce. The figures showing Belgium's trade in 1923 are not exactly comparable with those for previous years. Beginning with May, 1922, the economic union with Luxemburg was in effect and trade statistics make no distinction between the foreign trade of the two countries. The total trade may thus be increased to some extent, but the fact that trade between Belgium and Luxemburg has now become domestic commerce, offsets, in large measure at least, the increase due to the inclusion of trade between Luxemburg and other countries. No attempt is made in the following statistics to distinguish between Belgian and Luxemburgian trade in 1922 and 1923. The table for foreign trade appended here shows values in the different classifications. (The depreciation of the Belgian franc should be borne in mind: 1913, par, 19.3 cents; 1922, 7.68 cents; in 1923, 5.22 cents).

BELGIAN FOREIGN TRADE			
VALUES IN THOUSANDS OF FRANCS	IMPORTS		
	1913	1922	1923
Live animals	65,273	126,069	112,856
Foodstuffs and beverages	1,034,822	2,627,810	3,416,871
Raw materials	2,667,035	3,539,872	5,509,831
Manufactured articles	869,478	2,783,861	3,510,829
Totals	4,636,598	9,077,112	12,550,387
VALUES IN THOUSANDS OF FRANCS	EXPORTS		
	1913	1922	1923
Live animals	44,413	90,064	83,997
Foodstuffs and beverages	327,663	508,821	806,712
Raw materials	1,826,078	2,095,738	2,595,238
Manufactured articles	1,436,430	3,366,959	5,370,543
Totals	3,634,584	6,059,582	8,850,490

All of the figures in the foreign trade table are exclusive of the trade in gold and silver. Converted into dollars at the rates of exchange mentioned above, the total values of the commerce of Belgium were: imports in 1913, \$394,863,000; in 1922, \$697,385,000; and in 1923, \$665,004,000; exports in 1913, \$701,475,000; in 1922, \$465,552,000; and in 1923, \$462,220,000. From a dollar standpoint, the trade seemed to be still diminishing in 1923, but it must be remembered in this connection that the rise in prices, when a currency is depreciating rapidly as was the Belgian franc in 1923, is not so rapid as the fall in the value of the currency unit. It is probable that Belgian exports were actually somewhat greater rather than slightly less in 1923 than in 1922.

The distribution of Belgian foreign commerce in the same three years is shown in the next table.

DISTRIBUTION OF BELGIAN FOREIGN COMMERCE			
COUNTRIES	IMPORTS		
	1913	1922	1923
France	1,000,297	1,840,850	2,784,554
Great Britain	518,475	1,368,858	1,928,046
United States	420,496	1,030,781	1,481,384
Netherlands	356,998	1,001,838	1,285,379
Argentina	316,797	616,037	960,501
Germany	761,765	1,213,776	912,040
Italy	44,007	129,162	200,885
Switzerland	19,379	123,865	167,945

COUNTRIES	EXPORTS		
	1913	1922	1923
France	762,187	1,513,290	1,979,561
Great Britain	511,710	957,405	1,762,232
United States	106,881	218,401	340,865
Netherlands	320,930	644,715	1,182,755
Argentina	91,154	180,891	343,742
Germany	940,378	849,986	453,286
Italy	75,931	120,056	172,632
Switzerland	53,416	198,781	352,284

Leading imports in 1922 were cheese, wool and woolen goods, coal, cotton, machines and mechanical articles, lumber, coke, corn. Changes over 1913 were: an increased importance of coal and metallurgical products and the disappearance of flax, diamonds, hides, and crude rubber from the leading items. Leading exports in 1922 were iron and steel bars, woollens, coal, glass, flax yarn, machines and mechanical articles, refined sugar, flax. Changes over 1913 were: the increased importance of coal and iron and steel products, and the rising importance of Belgium as a manufacturer and exporter of glass, with the falling off of textiles except flax.

Finances. Even prior to 1914, deficits were not uncommon in the financial administration of the Belgian government. For instance, for the year 1913 budget estimates gave receipts as 758,452,349 francs and expenditures as 884,829,630 francs, leaving a deficit of 126,377,281 francs. In general, however, there was in pre-war days a relative equilibrium between expenditures and receipts. But for the period surveyed, this approximate balance was entirely destroyed; expenditures advanced to such an extent as to leave a considerable deficit, even had reparation receipts equaled budget forecasts (as they have consistently failed to do). For 1923, the deficit was officially estimated at 2,244,000,000 francs, but the failure to receive anticipated payments from Germany to cover the so-called "recoverable expenses" caused the actual deficit to be probably in excess of 4,000,000,000 francs. The same sort of situation existed with reference to the 1924 budget estimates, in which a deficit of 1,645,439,851 francs was shown; this budget included "recoverable expenses" of 1,636,000,000 francs, of which 1,500,000,000 represented the balance of Belgian priority under the Spa agreement, the receipt of which was at least problematic. Total receipts in the 1923 budget were set at 5,942,000,000 francs and expenses at 8,186,000,000 francs, while in the 1924 budget estimated receipts were increased to 6,687,000,000 francs and expenses to 8,332,000,000 francs. The extraordinary budget, included in the general budget for 1924, was reduced from the previous year by about 24 per cent by transfer to ordinary account of high cost of living allowances. The operating deficit of the state monopolies (railways, posts, telegraphs, and telephones) was reduced by 40 per cent, and it was hoped that a contemplated increase in rates would eventually wipe it out. Extensions of line and the purchase of new equipment, however, would add about 100,000,000 francs to the extraordinary expenditures beyond the amount required for 1923. The revenue budget showed important increases due to extensive tax reforms.

The Belgian public debt as expressed in paper francs varied considerably according to fluctuations in exchange. As the foreign debt was in gold, a drop in the franc caused an immediate increase in its amount as given in paper francs,

though its actual gold or dollar value did not change. The Belgian Ministry of Finance, calculating the external debt for each year uniformly at the exchange rate of Oct. 1, 1923 (United States dollar=19.20 francs), issued the accompanying table showing the increases in the public debt from year to year.

port of Antwerp in Belgian shipping and its continued importance in European trade.

History. Belgium's history was overshadowed by the War. On July 31, 1914, amid the alarms of a threatened world conflict, the Belgian government ordered a general mobilization. Two days later it was in receipt of an ultimatum

BELGIAN PUBLIC DEBT

DATE	CONSOLIDATED (Franks)	FLOATING (Franks)	TOTAL (Franks)
1914, Aug 4	5,205,000,000	661,000,000	5,866,000,000
1919, Oct 1	7,046,000,000	18,031,000,000	27,077,000,000
1920, Oct. 1	10,356,000,000	20,091,000,000	30,447,000,000
1921, Oct 1	11,858,000,000	24,582,000,000	36,440,000,000
1922, Oct 1	14,763,000,000	24,173,000,000	38,936,000,000
1923, Oct. 1	16,512,000,000	23,395,000,000	39,907,000,000

According to another statement, the total Belgian debt on Jan. 1, 1923 (using the exchange rate of that date, 14.70 francs to the dollar), was 37,446,367,125 francs, of which 15,246,899,970 francs was funded and 22,199,467,153 francs floating debt, of which latter 16,980,381,355 francs was external floating debt. Although some progress was made in the way of increasing revenues, and reforms of taxation were expected to yield considerable returns, the annual deficits of the Belgian government were still large in amount in 1924, and were increased by the failure to receive reparation payments anticipated in the budgets for each year. The extensive increases in the tax rates evinced a growing tendency to place little dependence on reparation and to rely more and more on internal resources. Prospects seemed hopeful for a gradual reduction of deficits, but the time of their elimination was, it was evident in 1924, as yet far distant.

Communications. Belgium is a small, well unified country, and communication facilities are excellent; the country has access to the sea, with a port of paramount importance in Antwerp; and it has also internal water connection by river and canal, as well as water and rail connection with the rest of western Europe. Practically all of the railways in Belgium are operated by the state; in 1913, the length of the state railways was 2712 miles, while in 1922, with the lines constructed during the War and those in the new districts of Eupen and Malmédy, it had increased to 2981 miles. The privately operated lines had in 1913 a length of 191 miles, but in 1922 this had declined to 171 miles. In 1913, the state railways yielded a profit of 119,619,000 francs from a total operating expense of 222,416,000 francs, while in 1919 they gave a deficit of 117,150,000 francs with a total operating cost of 530,352,000 francs. On Dec. 31, 1923, the Belgian merchant marine consisted of 179 steam and three sailing vessels, with a net tonnage of 378,923 and 2573 tons, respectively, compared with 124 vessels with a tonnage of 236,136 tons in 1913. The number of vessels entered at Belgian ports in 1923 was 13,406, with a tonnage of 19,963,596 tons, compared with 11,964 vessels and 17,097,515 tons in 1913. About two-thirds of the tonnage entered at Antwerp before the War, and the proportion increased somewhat after the War. The two other leading ports were Ghent and Ostend, which together receive about 20 per cent of the total tonnage. These statistics bring out particularly the increasing importance of shipping in Belgium, also the preëminence of the

from Germany demanding the right of passage across Belgian territories. The refusal to comply brought down on the Belgian people all the horrors of a war-ridden country. During August 3 and 4, German troops entered, and despite the heroic defense of the army, swept on unchecked. The lines yielded in rapid succession. Louvain was taken, August 10; Brussels, August 20; the French frontier was crossed on the 24th. The career of brutality embarked upon by the German invaders in an endeavor to break the spirit of the Belgian people will long remain a symbol of the meaning and purposes of modern warfare. The pillaging and burning of homes and the deportations and indiscriminate killing of civilians were coolly ordered and carried out by a staff and soldiery to whom war meant ruthlessness. Belgian official records reveal more than 1000 deaths in the province of Liège alone during August. The toll was almost as heavy in the Namur, Limburg, and Luxemburg provinces. The destruction of Louvain was indeed an act of cold-blooded ferocity. The city was entered on August 19 and was fired three days later after all effective opposition had ceased. The cathedral, the university and library, and more than 1000 homes were destroyed. In the city and its environs, 300 men were shot, and from it 1000 inhabitants were deported to forced labor in Germany.

In Flanders, the career of the Germans was the same. With the fall of Brussels, the Belgian government fled to Antwerp; from thence, after the fall of that city, it moved to Ostend, and later to Havre. Central administration, therefore, ceased, with the result that only the local authorities were left to attend to the business of government. That such was not to remain the condition of affairs at once became apparent. Under the German military governors, von der Goltz, von Bissing, and von Falkenhause, Belgium was organized as a conquered province for the purpose of utilizing her economic resources to the full. Authority was vested more and more in the hands of German officials as gradually the provincial councils were deprived of power. With the suppression of the latter in July, 1918, for their consistent refusal to collaborate with the occupation government, the Germans were in entire control of the country. Yet, while ostensibly German domination was complete, the spirit of the people could not be crushed. Opposition was never completely stilled. The world now and then caught echoes of the heroic deeds of a M. Max or a Cardinal Mercier. *La Libre Belgique*,

printed secretly, appeared regularly from 1915 to the end of the War.

In every channel of Belgian life, no matter how insignificant, the German influence was to be encountered. Law and justice received a studied attention. Military and civil tribunals were erected to try offenders under the edicts emanating from the German authorities; punishments might be meted out to substitutes, and confiscation of property was countenanced. Finally, in 1918, the Belgian courts were abolished altogether. Something of the repressive character of the edicts may be gained from the fact that not merely was tale-bearing encouraged, but punishment was imposed on those who were believed cognizant of an illegal act and who did not denounce it. The presence of spies, etc., had to be reported on pain of long-term imprisonment. Even in civil practice profound modifications were introduced. For refusing to accept German interference in the regular court procedure, Belgian magistrates were often forcibly seized and deported to Germany. In 1918, the most flagrant example of this conduct occurred when the justices of the Brussels Court of Appeals were interned in a German civilian camp. Belgium was struck at in other ways, notably in the attempt to separate Flanders from Wallonia. From 1914 to 1917, the occupation government employed all means to encourage the use of Flemish in the northern provinces. In 1917, von Bissing finally effected a complete separation by erecting two different administrations, one for Flanders to be governed from Brussels, where Flemish was to be used exclusively; the other, to be governed from Namur. Attempts were made seriously to further the partition. A Flemish party known as the "Activists" received the encouragement of the Germans in its propaganda. In 1918, an attempt was made to hold elections for members of a Flemish consultative council, but so great was the antagonism aroused that the order was given to desist. A council was nevertheless erected, bolstered up by German arms; attempts on the part of the Belgians to arrest members of the council were met with reprisals, which led to more bitterness. In these schemes the University of Ghent was chosen as the pivotal point. To hasten the process of Flemization, all professors except those Activist in sympathies were dismissed; lectures were ordered to be given in Flemish; to attract students all other universities were closed and liberal scholarships were offered. Nevertheless, the University did not thrive. In fact, all these plans met with failure, and the move to divide the country culturally never met with any real Belgian support.

It is not to be supposed that German domination stopped here. Possibly affecting the life of the people more closely was the Germanization of all branches of the economic order. Belgium, in short, was utilized to further the German military effort. By requisitions, by administrative orders, by forcible seizure, Germany soon gained control over all branches of Belgian industry and trade. Central bureaus, making in effect German monopolies, were put in charge, beginning with 1914, of coal, water, gas, electricity, oils and fats. Raw materials were requisitioned and paid for at prices fixed by German officials, not, however, in coin, but in vouchers. Requisitions even penetrated into the homes where all household articles contain-

ing materials needed in the war, e.g. copper, zinc, lead, iron, leather, wood, wool, cotton, etc., were seized. The work of the "coal central" was typical. Coal produced was utilized first on the railways and then for the army, the needs of Belgian industry came next; finally the surplus was exported to neutral countries and the profits appropriated under the guise of a war loan. As industry languished because of the cessation of trade and the sequestration of raw materials and machinery by the Germans, the status of the civil population became alarming. Unemployment daily increased until by 1917 the body of idle workers numbered 700,000. This state of affairs gave color to the German excuse for expediency for the large-scale policy of deportations which the occupation government inaugurated in 1916. The lack of raw materials and the inadvisability of spending large sums for public works in a country subject to the chances of war prompted the German government, ostensibly, to offer employment to Belgians in German industries or in war areas behind the lines. In spite of Belgian protests that factories were willfully being destroyed and local units hindered in their work of relief and that action of such a character was merely an excuse for a studied plan to crush the Belgian industrial and national life, the Germans proceeded in the years 1916-18 to deport more than 50,000 Belgians to Germany and another 50,000 to the war areas. Undoubtedly some Belgians went willingly, for even the small wages offered were more acceptable than starvation, but that coercion was the rule cannot be denied. The treatment accorded these unfortunate individuals was of a piece. Used brutally, often starved at the first sign of recalcitrancy, Belgians were set to work digging trenches and constructing railroads in the war zones or making munitions in the German factories. The protests of Belgians, Cardinal Mercier chief among them, were unavailing. Not until the American, Dutch, and Spanish diplomats took up the cry did the German Emperor consent to rescind the order and promise to send back all these deportees against whom coercion had been applied. This pledge was never carried out. Some sent back to Belgium were reshipped to France; others were put to work in the seized Belgian factories; many more were returned to Germany. Deportations, in fact, never ceased until the end of the war.

The story of Belgium during the War cannot be complete without the tale of the Commission for Relief in Belgium. This organization, brought into existence late in 1914 by the American and Spanish ambassadors and ministers at London and Brussels, and the American ambassador and minister at Berlin and at the Hague, and managed until America's entry by Mr. Herbert C. Hoover, became the international clearing house and liaison division for the Belgian *Comité National de Secours et d'Alimentation* in the work of feeding Belgium. Importations and payments were handled by the Commission; distributions by the *Comité National*. To facilitate the work, the United States opened a monthly credit of \$15,000,000 for the Commission. An idea of the scope of the project may be gained from the fact that the provisioning department of the Commission undertook to feed from 7,000,000 to 10,000,000 people in the devastated areas of Belgium and northern France. During the year ending Oct. 31, 1916,

THE UNIVERSITY OF LOUVAIN

THE RESTORATION OF THE LIBRARY OF THE UNIVERSITY OF LOUVAIN MADE POSSIBLE BY AMERICAN GIFTS

The Principal Facade from the Drawing of the Architects, Warren & Wetmore

there were imported 1,706,774 metric tons of food into Belgium and 483,346 tons into France. Nearly one-half of these supplies came from the United States and the remainder came about equally from Argentina and the British Empire, though small quantities came from Holland. Food was distributed through 3000 communal communities in Belgium and 2000 in France, staffed by about 35,000 volunteer workers. The benevolent department of the Commission cared for those who were wholly or partially destitute, including more than 1,500,000 children. It maintained special committees for children, farmers, refugees, the tubercular, destitute, and others. Up to the close of 1917 the Commission had expended nearly \$400,000,000, and during the fiscal year ending Oct 31, 1918, it spent for relief in Belgium over \$83,000,000 received from loans to Belgium by the United States, and \$7,275,000 from loans by Great Britain and France. To complete the account, it should be stated that the Commission also expended in 1918, in northern France, \$56,000,000 received from the United States loan to France, and an additional \$2,376,500 received from French sources. When the Commission wound up its affairs on Apr. 30, 1919, it was stated that something like \$1,000,000,000 had been spent in the relief of war victims during 1914-19. Until the entrance of the United States into the War the entire personnel of the Commission was American; after 1917, direction was taken over by Spanish and Dutch citizens, although Mr. Hoover remained throughout as chairman. The director in America was Mr. W. L. Honnold, its treasurer, Mr. A. J. Hemphill, while Mr. Poland was the European director.

Nothing presented so disheartening an aspect as the condition of Belgium on the resumption of peace, and nothing showed so clearly the enduring qualities of the human spirit as the rapidity with which Belgium was resurrected. Not only had industry been destroyed but the usual channels of communication had been completely dislocated. In fact, the damage to property was put at \$7,600,000,000. Yet by the end of 1922 it could be seen that the manufacturing industries were practically on a normal footing. Iron and steel plants were operating on a 75 per cent basis; linen, cotton, and artificial silk works exceeded their pre-war capacity, as did also the plate-glass and cement factories. The acreage under crops in 1922 was 97 per cent of the 1913 figure. In 1918 shipping was dead, the ports of Zeebrugge and Ostend badly damaged and their terminal facilities wrecked. The approach to Ghent by the sea canal from Holland was choked up because of the severe fighting which had taken place in that area. The losses from destruction of railway bridges, etc., in the four years of war were estimated at \$275,000,000. Rolling stock had been diverted for military purposes and had greatly depreciated, rails had been torn up by the enemy in retreat. Yet so rapidly had reconstruction been pushed that 58,221,686 metric tons of freight were carried on the railroads in 1922 as against 66,541,975 metric tons in 1913, and 238,096,000 passengers in 1922, as against 204,541,098 in 1913. At the time of the Armistice there were 800,000 industrial workers unemployed and being supported by government doles; in September, 1919 the number thus supported had fallen to 200,000; by 1923 it was reported that marked

shortages of labor were apparent in all specialized industries and so acute in the unskilled trades that laborers had to be imported from Poland and Italy.

The political parties met the awesome problems with courage. A coalition government representing the Catholics, Liberals, and Socialists administered affairs. The election of 1919, for the first time, was conducted on the principle of "one man, one vote" (women being given the vote only in municipal elections), and resulted in a great increase of the Socialist delegation. Legislative measures were progressive and showed a desire to conciliate all elements of the populace. In 1919, the repressive laws against freedom of association were, to a great extent, lifted and labor unions accordingly increased mightily; the eight-hour day in industry was installed in the same year; so were the income tax, a progressive inheritance tax, and a law limiting the sale of alcohol. Councils and commissions were erected for the amicable settlement of problems arising between capital and labor and their functions soon penetrated into almost every important industry. Echoes of the controversy over the Flemish question continued to be heard increasingly. In 1919, three Activists were elected to Parliament besides many others of Flemish sympathies in the Catholic party, so that, for a time, the government considered offering a Fleming a cabinet portfolio. In 1921, the line of division became sharper. As a result of continued agitation, the lower house passed a bill for the installation of both languages in the administration, to go into effect Jan. 1, 1922. The measure occasioned a storm of disapproval. Debate in the house was heated, and for the first time in parliamentary annals, Walloons and Flemings voted against each other in solid blocs. It became increasingly perceptible that the Flemings could not be denied. Their attacks on the influence of the French became more bitter, their focal point in particular being the University of Ghent. Despite the pleas that the French language was necessary to bridge the gap of the patois used by both branches of the population and that the University was therefore necessary as the seat of a common culture, the lower house in 1922 voted for the use of the Flemish language at Ghent. In June, 1923, the Flemish question almost occasioned the fall of the Theunis government. This question, and the new economic and social problems which the War had brought in, had a curious effect on political groupings. The traditional three parties were in a process of disintegration which showed itself in alliances cutting athwart party lines. Thus, the Catholic Right, under the control of the Flemings, was split up into Christian Democrats, Agrarians, Moderates, and Conservatives, the Socialists belonged to national and international groups, the latter Fleming in sympathy, the Liberals were either Conservative or Socialist in their leanings. Government, therefore, was falling more and more into the bloc system. On the Flemish question, the Catholics, international Socialists, and some Liberals stood together, and as this policy was antipathetic to France, the group also opposed a French alliance and favored one with Holland. However, on the question of military service the group did not hold together, so that another alliance was necessary to effect legislation. The same situation held in the question of the extension

of the provincial and parliamentary franchise to women. The Catholics, for reasons of political expediency and because of the innate conservatism of the women, favored the project. The Liberals and Socialists, though they were committed to the principle of political equality for women, strenuously opposed. The result, because of these mixed loyalties, was an impasse after the election of 1921 which had ended in the return of a majority for no party. Only with the greatest difficulty was Colonel Theunis able to form a cabinet composed of Catholics and Liberals.

In the domain of foreign policy an attempt was made to strike a new and more independent note, with little success, however. Belgium's plea for revision of the treaty of 1839 by which she had lost to Holland the Province of Limburg and had been compelled to share with the Dutch the control of the Scheldt, was not entertained by the Peace Conference, and subsequent negotiations with Holland were equally fruitless. (See HOLLAND and LIMBURG). Her territorial gains as a result of the War were very small. To her fell the districts of Eupen and Malmédy and the tract of Moresnet on the German frontier, in all containing 382 square miles and a population of 64,000, and important for tanning and textile works. Only a small number of the population having indicated their desire to remain under German sovereignty, these regions were formally annexed in September, 1920. (See EUPEN, MALMÉDY, and MORESNET.) In Africa, Belgium obtained Ruanda and Urundi, districts in western ex-German East Africa, which have an area of 18,000 square miles and a population of 3,500,000, and are important agriculturally because of their uplands. (See CONGO, BELGIAN). In 1918, Belgium effected with France a defensive alliance, and a military convention was concluded in 1920. An economic convention designed to cement still further the interests of the two countries was rejected in the Belgian Chamber, in February, 1924, by a coalition of Socialist and Flemish Catholic deputies, whose opposition led Premier Georges Theunis to reorganize his cabinet, dropping out M. Jaspar and replacing him with M. Paul Hymans as Foreign Minister. In 1922, Belgium concluded a treaty with Luxemburg by which all customs barriers were abolished. As for Russia, though the government in 1920 seemed favorably disposed toward a resumption of commercial relations, in 1922 it definitely sided with France at the Genoa Conference against any recognition, unless Russia conceded the rights of private property. The reasons for the Belgian hostility were plain: it was indicated that Belgians had controlled about 150 Russian industrial and mining enterprises, capitalized at \$700,000,000.

By the Peace Treaty, in addition to 8 per cent of the German indemnity, Belgium was assured reimbursement from Germany for the 5,000,000,000 francs borrowed from the Allies and expended in the War. In the controversies with Germany regarding reparation payments, Belgium, like France, was disposed to insist rigorously on execution of the Versailles Treaty, and with France Belgium joined in occupying the Ruhr, January, 1923. Subsequently, however, French and Belgian policies tended to diverge, until the report of the Dawes Commission in 1924 offered a new basis of agreement. See REPARATIONS.

BELGIUM, COMMISSION FOR RELIEF IN. See BELGIUM.

BELL, OLIVE (1881-). An English art and literary critic, educated at Trinity College, Cambridge. In his critical essays he has harshly rebuked all artists who follow the doctrine of exact representation and lauded those wielding their talent for the expression of personal emotion. He is the author of *Art* (1914), *Peace at Once* (1915), *Pot Boilers* (1918), *Poems* (1921), *Since Cézanne* (1922), and *On British Freedom* (1923).

BELL, GERTRUDE M. L. (1868-1926). An English traveller and geographer, born at Washington, Durham, and educated at Queen's College, London, and Lady Margaret Hall, Oxford. During the War she was in a position, because of her adventurous journeys through northern Arabia (1913-14), to give valuable information concerning unknown routes and so to aid the British army in its advance into Palestine. She was connected with the Red Cross Bureau of the Missing (1914-15) and the Admiralty Intelligence Office in Cairo (1916-17). In 1917, she went with the British army to Bagdad and later acted as assistant political officer. She has received the founder's medal of the Royal Geographical Society. Her publications include *Poems from the Divan of Hafiz* (1897); *The Desert and the Sown* (1907); *The Thousand and One Churches*, with Sir W. M. Ramsay (1909); *Palace and Mosque at Ukhaider* (1914), and *Review of the Civil Administration of Mesopotamia*, issued by the Indian Office (1920).

BELL, JAMES FRANKLIN (1856-1919). An American soldier (see VOL. III). He commanded the second division of the United States army in Texas, 1914-15; the western department at San Francisco to May, 1917, and the Eastern department to September, 1917, when he became commander of the 77th Division of the army, at Camp Upton.

BELL, LOUIS (1864-). An American electrical engineer, born at Chester, N. H. He was graduated at Dartmouth in 1884 and won a fellowship at Johns Hopkins. During 1888-89 he was professor of applied electricity in Purdue University and during 1890-92 he was editor of *The Electrical World*, but after 1893 was in practice in Boston as a consulting engineer. He was active for many years in the General Electric Company and organized its electric power transmission department; he designed the first polyphase plant used in the United States, both for power and lighting, as well as for railway service. His original investigations have included studies on spectroscopy, alternating current phenomena, wireless telephony, physiological optics, and the interpretation of albedo. During 1905 he lectured on electrical power of transmission at the Massachusetts Institute of Technology, and he has also lectured at Harvard on public lighting and since 1914 at Harvard Medical School on illumination. In addition to many scientific papers and monographs he is co-author, with Oscar T. Crosby, of *The Electric Railway* (1892), *Power Distribution for Electric Railroads* (1896), *Electric Power Transmission* (1897), *The Art of Illumination* (1902), and *The Telescope* (1922).

BELLINGER, PATRICK NELSON LYNCH (1885-). A naval airman born at Cheraw, S. C., and educated at the United States Naval Academy. During the seizure and occupation of

Vera Cruz in 1914 he was in charge of the airplane section and made daring flights over enemy territory. In 1919 he assisted in selecting a starting-point for the Transatlantic flight and commanded the *NC1* during the flight (May 3-June 16). Later he had charge of the material division of naval aviation. During the War he received the order of the Commande-Torre Espada from the Portuguese Government and the Navy Cross.

BELLOC, HILAIRE (1870-). An English author, born in France (see Vol. III). Since 1913 Mr. Belloc has lengthened the list of his works with *A Continuation of Linguard's History to the Death of Edward VII* (1914), *The Last Days of the French Monarchy* (1916), *General Sketch of the European War, second Phase (The Battle of the Marne)* (1916), *Europe and the Faith* (1920), *The House of Commons and the Monarchy* (1920), *The Jews* (1922), *The Mercy of Allah* (1922), and *A Contrast* (1923).

BELLOWS, GEORGE WESLY (1882-1925). An American artist (see Vol. III). In the last few years he won a very long list of awards for his very unusual paintings. The chief awards included the Carnegie Institute bronze medal (1914), gold medal Panama Pacific Exposition (1915), bronze medal from the Art Institute of Chicago (1916), Isidor medal National Academy of Design (1916), Temple medal of the Pennsylvania Academy (1917), landscape prize from the Newport A. A. (1918), gold medal from the Pennsylvania Academy (1921), bronze medal from the Art Institute of Chicago (1921) and first prize at Carnegie Institute (1922).

BELMONT, ALVA E. SMITH (Mrs. O. H. P.) An American feminist, born at Mobile, Ala., and educated in France. While actively and generously interested in all movements for social betterment, such as hospitals, children's homes, the abolition of child labor, and the improvement of working conditions for women engaged in industry, she is known preëminently for her efforts in the cause of woman's rights. A well-known speaker and writer on woman suffrage, she was founder and later president of the Political Equality Association. She was an organizer of the Woman Voters' Convention in 1915, and a liberal donor to the Woman's Party.

BELOIT COLLEGE. An institution at Beloit, Wis., founded in 1846. The number of students increased from 395 in 1913-14 to 519 in 1923-24, the number of members in the faculty from 35 to 47, and the library from 50,000 to 70,000 volumes. The endowment rose in the same period from \$1,268,966 to \$1,802,531. Edward Dwight Eaton, D.D., LL.D., who had been president since 1886, was succeeded in 1917 by Melvin Amos Brannon, Ph.D., LL.D., but was acting president again in 1923. President, 1924, Irving Mauer, M.A., B.D.

BELOW, OTTO VON (1857-). A German soldier born at Danzig. In the War he took part as an army commander in the battles of the Masurian Lakes (February, 1915), the Macedonian campaigns of 1916, the Italian campaigns of 1917, and the battles on the western front in 1918. In the last, he commanded the 17th army. He retired in 1919.

BEMONT, CHARLES (1848-). A French historian and palæographer. He was born at Paris and pursued his education at the Lycée de Versailles and at the University of

Paris, whence he was graduated as an archivist and palæographer. He became subsequently the director of the Ecole Pratique des Hautes Etudes, an institution maintained by the French government for the encouragement of disinterested scholarship outside of the academic degrees. He was also editor of the *Revue Historique*. The list of his works includes *Simon de Montfort, Comte de Leicester* (1884); *De la Condamnation de Jean-sans-Terre* (1884); *Rôles Gascons; Chronique Latine sur le Premier Divorce de Henry VIII* (1917); *Le Conte de l'île d'Oleron* (1917), and *Histoire de l'Europe de 395 à 1270*, in collaboration with Gabriel Monod (1921).

BEN-AMI, JACOB (?-). A Jewish actor born abroad who came to the United States and played rôles in Yiddish for the Yiddish Art Theatre. He was discovered by Arnold Daly and played in a special production of the Theatre Guild with Daly's company *The Race with the Shadow*. Later he made a success as Samson in *Samson and Delilah* for Arthur Hopkins. In 1923 he starred in *The Failures* with Winifred Lenihan and in 1924 in *Man and the Masses*, both Theatre Guild productions. He also played with Doris Keane in *Welded* and on the vaudeville stage.

BENAVENTE Y MARTINEZ, JACINTO (1866-). A Spanish playwright and author born in Madrid, where he attended the University. He later traveled with a circus and appeared on the stage. His first literary work was a volume of poems (1893), but his forte was drama. Benavente has been closely connected with a twentieth century renaissance in Spain. Nearly all his plays are woven about the awakening of Spain. As editor of *La Vida Literaria*, he assumed intellectual leadership of a group of writers connected with the modern movement. *Gente Conocida (In Society)* (1896) established his reputation. In his works the Spanish tradition of melodramatic artificiality has been discarded, and its place has been taken by a forceful impressionism and finished workmanship. Among his works are *Autumnal Roses* (1905); *The Evil Doers of Good* (1905), one of his best; *The Bonds of Interest* (1907); *Princess Bebe* (1909); *La Malquerida* (1913); *Nuevo Coloquio de los Perros* (1916); *Cartas de Mijeres* (1917); and *Tigulinas* (1921). Benavente received the Nobel Prize in 1922.

BENCHLEY, ROBERT CHARLES (1889-). An American editor and humorist, born at Worcester, Mass., and educated at Harvard University. In the period 1912-14, he was with the Curtis Publishing Company and subsequently joined the editorial staff of the *New York Tribune* (1916-17). He was managing editor of *Vanity Fair* (1919-20), dramatic editor of *Life* (1920), and literary critic on the *New York World* (1920-21). Mr. Benchley's writings have the supreme virtue of genuine humor. *Of All Things* (1921) and *Love Conquers All* (1921), collections of essays, introduce commonplaces so quietly and ludicrously as to tickle the stiffest humor.

BENCKENDORFF, COUNT ALEXANDER (1849-1917). A Russian diplomat, educated in France and Germany. He entered the diplomatic service in 1869, acting as attaché to the Russian embassies in Rome and Vienna. From 1897 to 1903 he was minister to Denmark, and from the latter year until his death he was ambassador to Great Britain. Largely responsi-

ble for the reconciliation between Russia and England, he negotiated the Anglo-Russian agreement of 1907 which resulted in the Triple Entente.

BENDA, JULIEN (1867-). A French critic and novelist. In a period dominated by literary Bergsonism, he became the vigorous defender of intellectualism and classical aesthetics. His *Belgephor* (1918) is an attack on the artistic standards of the twentieth century and its cultivation of feminine sentimentalities. His novels, *Les Amourandes* (1922) and *La Croix des Roses* (1923), are as intellectual as his critical theory. Before the War, he published two polemical works against the new philosophy of Bergson, *Le Bergsonisme, une Philosophie de Mobilité* (1912), and *Sur le Sens du Bergsonisme* (1914). The *Dialogue d'Eleuthère* is a charming philosophical discussion of the follies of the modern age, particularly its subjection to women.

BENDA, WLADYSLAW THEODOR (1873-). A Polish-American illustrator educated in Cracow, Vienna, San Francisco and New York. He is best known for his illustrations for *The Century*, *Scribner's*, *The Cosmopolitan*, *McClure's*, *Collier's*, *Hearst's International*, and other magazines and for his creation of a new type of masks known on the stage as "Benda masks." He was awarded a silver medal for his work at the Panama Pacific International Exposition, in 1915.

BENEDICT XV, GIACOMO DELLA CHIESA (1854-1922). The two hundred and sixtieth successor of St. Peter, first bishop of Rome. He was born at Pigli, Italy, educated at the gymnasium of his native city, and graduated with a doctor's degree in jurisprudence at the University of Pigli. He was ordained as a priest in 1878 and later served as undersecretary to Cardinal Meriano Rampolla. He was created archbishop of Bologna in 1907 and elevated to the Cardinalate in May, 1915; in September of that year, just two months after the outbreak of the War, he was elected pope. Benedict XV was a modest and unassuming head of the Roman Catholic Church, a sincere patron of the arts, and, as his handling of the diplomatic situation at the Vatican during the chaos of the War proved, a subtle statesman. Among those who owed allegiance to Rome was Austria, the strongest supporter of the Vatican in Europe, and Belgium, equally faithful and receiving the sympathy of a world wholly out of accord with Austria and her allies. In the tension of the War Benedict XV was called pro-German because of his failure to protest to Germany and to act strictly as a representative of the Prince of Peace. Nevertheless it was only a week after his coronation that he exhorted rulers to "enter into a council of peace with all speed." He suggested a Christmas truce in December, 1914, but Russia and Turkey would not acquiesce. In March, 1916, having appointed special days of prayer for peace in the interim, he asked all belligerents for a statement of their demands and wishes and for "necessary sacrifices of pride and particular interests." He suggested to President Wilson in May, 1916, that the United States offer to conciliate the belligerents and expressed his approval of Mr. Wilson's peace note in 1917. In 1918, he made a final appeal for peace on the basis of "complete and reciprocal condonation," the evacuation of Belgium, and the freedom of small nations. Benedict XV modeled his policy on

that of Leo XIII and Pius X. During his pontificate friendly relations were restored between the Vatican and the French government, so that France was again represented at the Vatican by an ambassador, and the Vatican at Paris by a nuncio. Great Britain also had a representative in Rome for political reasons. On Jan. 16, 1922, the pope was suffering from a slight cold which speedily developed into pneumonia, and he succumbed on Jan. 21, 1922.

BENELLI, SEM (1877-). An Italian playwright whose work is characterized by a certain freshness of poetic fancy, well illustrated in his most recent productions, *Ali*, *The Love Thief*, and *La Santa Primavera*. One of his best known early plays, *La Befia*, put on at the Théâtre Sarah Bernhardt (Paris) in a French adaptation in 1910, was repeated several years later in New York as *The Jest*, with John and Lionel Barrymore. During the War he wrote some verses published as *L'Altare* (1916). His other recent work includes *L'Arzigagolo*, *Poema Buffonesco*; *La Gorgona*; *The Love of the Three Kings*, translated into English by Howard Mumford Jones; *La Maschera di Bruto*; *Le Nozze dei Centauri*, and *Parole di Battaglia*. On *The Love of the Three Kings* (*L'Amore dei Tre Re*), Italo Montemezzi has composed one of the most moving and beautiful of modern operas.

BENES, DR. EDWARD (1884-). A premier of the Czecho-Slovak Republic, born at Kozlany, Bohemia, and educated at the University of Prague and the Sorbonne. During the War he went to Paris as a journalist and diplomat, working with T. G. Masaryk, later president of the Czecho-Slovak Republic, for the setting up of the independent Czecho-Slovak Republic. He was general secretary of the Czecho-Slovak National Council in Paris at 1917 and a member of the Czecho-Slovak delegation to the Peace Conference at Paris at the end of the War. He published *La Problème Autrichien et la Question Tchèque* (1908); *The History of the Labor Movement in Austria* (1913); *Quelques Vérités Simples sur la Fédéralisation de l'Autriche-Hongrie, dans la Nation Tchèque* (1914-18); *Bohemian Case for Independence* (1917); *La Boemia contra l'Austria-Ungheria* (1917); *Detruisez l'Autriche-Hongrie* (1916); *Le Socialisme Autrichien et la Guerre*; *Political Partisanship* (1914); *The War and Culture* (1915), and *The Spirit of the Czecho-Slovak Revolution* (1923).

BENÉT, STEPHEN VINCENT (1898-). An American author, born at Bethlehem, Pa., and educated at Yale University. As a student at Yale he published *Young Adventure* (1918) and won a poetry prize. These early poems showed a precocious facility which has since developed into whimsical and bizarre expressions, in which he is at his best. Other publications of his include *Heavens and Earth* (1920); *The Beginning of Wisdom* (1921); *Young People's Pride* (1922), and *Jean Euguenot* (1923).

BENÉT, WILLIAM ROSE (1886-). An American author and editor. He was born at Ft. Hamilton, New York Harbor, and was educated at the Sheffield Scientific School of Yale. From 1907 on he engaged in journalism and editorial work, first in California and later as a member of the editorial staff of *The Century* (1911-18) and the *Nation's Business* (1919-20). In 1920 he became associate editor of the important *Literary Review* of the *New York*

Evening Post. He wrote poetry of merit characterized by an excellent sense of form and a real imaginative talent, besides a finely drawn romance and many critical papers. Among his published works were the volumes of verse, *Merchants from Cathay* (1913); *The Falconer of God* (1914); *The Burglar of the Zodiac* (1918); *Moons of Grandeur* (1920); the novel, *First Person Singular* (1922); essays in *Saturday Papers*, with H. S. Canby and A. Loveman (1921); and a translation with his wife of Claudel's *The East I Know* (1914). In 1923 he married Elinor Wylie, the poet.

BENJAMIN, MARCUS (1857-). An American editor, born at San Francisco, Cal., and educated at the Columbia University School of Mines. After following his profession of chemist for several years he turned to editorial work and has served on the staffs of the *Cyclopædia of American Biography*, the *Standard Dictionary*, the *Universal Cyclopædia*, the *New International Encyclopedia* and its year books and was editor-in-chief of *Appleton's New Practical Cyclopædia*, 6 vols. (1910). Since 1896 he has been the editor of the publications of the United States National Museum and has been a member of the annual United States Assay Commission. During the World War Dr. Benjamin was an aid in the office of Naval Intelligence and received the decoration of the golden palms with the rank of Officier de l'Instruction Publique from France in 1920.

BENJAMIN, RENÉ (1883-). A French writer and novelist. He leaped into prominence through the publication of his war novels, *Gaspard* (1915) and *Les Repatriés* (1918). The former was unanimously awarded the Prix Goncourt for 1915. M. Benjamin excels in portraiture of Parisian working types and reproduces argot in the naturalistic manner of Zola. Unlike Zola, he has no sociological ax to grind, and his types are singularly rich and good humored. Of his other works several are satires, like the *Farce de la Sorbonne*, *Le Palais et ses Gens de Justice*, *Amadou Bolchéviste*, and *Sous le Ciel de France*. *Les Plaisirs du Hasard* is a light-hearted, sparkling play, produced in Paris in 1922.

BENNETT, (ENOCH) ARNOLD (1867-). An English writer (see Vol. III). Some of his latest works are *A Great Man* (1915) *Over There: War Scenes on the Western Front* (1915); *These Twain* (1916); *The Lion's Share* (1916); *Books and Persons* (1917); *The Pretty Lady* (1918); *The Roll Call* (1919); *From the Log of the Velsa* (1920); *Our Women: Chapters on the Sex Discord* (1920); *Things That Have Interested Me* (1921); *Mr. Prohack* (1922); and the plays, *The Tittle* (1918), *Judith* (1919), *Sacred and Profane Love*, 2d ed. (1919), *The Love Match* (1922), etc.

BENNETT, RICHARD (1873-). An American actor born at Deacon's Mills, Ind., who made his first stage appearance in Chicago in 1891 as Tombstone Jake in *The Limited Mail* and appeared continuously after that time. In 1906 he made his first London appearance but after 1907 acted chiefly in New York. He is best known for his characterizations of George DuPont in Brieux's *Damaged Goods* (1914); Julien Brignac in *Maternity*; Chick Hewes in *Kick In*; Peter Marchmont in *The Unknown Purple*; Christopher Armstrong in *For the Defense*; Robert Mayo in Eugene O'Neill's *Beyond the Horizon*; "He" in Andréev's *He Who Gets*

Slapped (1922), and the leading rôle in Sir Gerald du Maurier's *The Dancers* (1923).

BENOIT, PIERRE (?-). A French novelist. After the War he was one of the most widely read of French authors. Critics found in his work a mixture of the romantic and the entertaining to induce forgetfulness of the sorrows of war. Just after the Armistice, *Königsmark* appeared, with a fatalistic setting of a small German principality. Benoit successfully exploits this air of fatality, eventually dispelled by a happy ending, in almost all his novels. *L'Atlantide* (1919), which earned the author the Grand Prix du Roman of the Académie Française, is an Oriental fairy tale of Northern Africa. Its art was likened to that of Stevenson's South Sea romances. In *Don Carlos* (1920), *Le Lac Salé* (1921), and *La Chaussée des Géants* (1922), his subject was again a woman marked by the finger of doom and saved in the last chapter. Benoit conveyed in his works the impression of discussing some great problem of the day, feminism in *Don Carlos*, Mormonism in *Le Lac Salé*, and the Irish question in *La Chaussée des Géants*. And in his most recent book, *L'Oublié*, he manages to bring in the problem of Armenia, without, however, spoiling the interest of the story. The majority of M. Benoit's novels have been translated into English.

BENRIMO, J. HARRY MCALPIN (1874-). An American dramatic author and director, born at San Francisco, where he made his first stage appearance in 1892. In 1897 Benrimo acted for the first time in New York (Manhattan Theatre) and in London. Subsequently he appeared in popular successes in New York and London, but is probably best known as the co-author of *The Yellow Jacket*, with George C. Hazelton (1912). He is also co-author of *Taking Chances* (1916) and *The Willow Tree* (1917). He has lived in London in recent years, devoting his time to stage direction and consultation.

BENSON, ALLEN I. (1871-). An American editor and writer on pacifism. He was born at Plainwell, Mich., and educated in the public schools. He was a member of the reportorial or editorial staffs of newspapers in Chicago, Salt Lake City, and San Francisco (1890-97); assistant managing editor of the *Detroit Journal* (1897-1901); managing editor of the *Detroit Times* (1901-06), and of the *Washington (D. C.) Times* (1906-07); and a writer on political and economic subjects for *Pearson's Magazine* (1908-16), and of signed editorials for *The Appeal to Reason* (Girard, Kan., 1914-16). He early identified himself with the Socialist party and with the pacifists. Soon after the beginning of the War, he proposed an ingenious plan for preventing war, his theory being that an aggressive war should be declared only by vote of the people, and those voting for it should be compelled to fight immediately. In 1916, he was nominee of the Socialist party for president of the United States, but in 1918, he resigned from the party, and in the latter year founded, with W. F. Cochran, the *Reconstruction Magazine*. He is well known as a writer on socialism, government, war, etc. and is author of *The Usurped Power of the Courts* (1911); *Common Sense about the Navy* (reprinted after 1911 by the Anti-preparedness Committee; *The Truth About Socialism* (New York, 1914); *Our Dishonest Con-*

stitution (New York, 1914); *A Way to Prevent War* (1915); *Inviting War to America* (New York, 1916); *What Ford Wages Have Done* (1917), and others.

BENSON, SIR FRANK (1858-). An English actor born at Alresford, Hants, and educated at Winchester and New College, Oxford. He was knighted in 1916. During the War he served as an orderly in a canteen and as an ambulance driver, receiving the Croix de Guerre on the battlefield near Oudenarde. Benson came of a very talented family; one of his brothers was W. A. S. Benson and the other Godfrey Benson, an active Liberal politician. At Oxford, Sir Frank appeared in Greek plays; immediately after leaving college, he went on the stage and made his first appearance under Henry Irving at the Lyceum Theatre in *Romeo and Juliet* (1882). He very shortly became manager of his own company, which had the reputation of putting the future stars of the English theatre through their first stage exercises. In 1901 Benson founded a dramatic school. From 1888 he managed the Stratford-on-Avon Shakespearean Festival and was presented with the freedom of the city (1910) in recognition of his services. On the occasion of the Shakespeare tercentenary he played the title role in *Julius Caesar* and was knighted by the King of England after the performance.

BENSON, FRANK WESTON (1862-). An American artist (see VOL. III). He won the Corcoran gold medal and first W. A. Clark prize at the Corcoran Gallery Washington (1919); the Logan medal and prize from the Art Institute of Chicago (1922); the Logan prize from the Chicago Society of Etchers (1918).

BENSON, WILLIAM SHEPHERD (1855-). An American naval officer, born in Macon, Ga., and educated at the United States Naval Academy. In 1881 he was made ensign and rose through the various grades, becoming lieutenant-commander in 1900, captain in 1909, and rear-admiral in 1915. He served on various assignments at the United States Naval Academy and afloat, including division and squadron commander. He was commandant of the Philadelphia Navy Yard (1913-15) and in 1915 was appointed Chief of Naval Operations. In 1917 he was a member of the commission appointed by President Wilson to confer with the Allies in Europe and was also a member of the special commission abroad. He served as naval representative in drawing up the naval terms of the Armistice with Germany and the Central Powers, and was naval adviser to the American Commission at the Peace Conference at Paris. He continued to serve as Chief of Naval Operations until Sept. 25, 1919, when he was retired by operation of law. In 1920 he was appointed chairman of the United States Shipping Board and in the following year became a commissioner of that board.

BENTLEY, MADISON (1870-). An American psychologist, born at Clinton, Iowa, and educated at the University of Nebraska and Cornell University. He was instructor and assistant professor of psychology at Cornell University from 1898 to 1912 and has been professor and director of the psychological laboratories at the University of Illinois since 1912. He has continued the tradition of the Cornell school and has edited and supervised studies in social and general psychology (1916), and crit-

ical and experimental studies in psychology (1921), both reporting the researches carried out in the Illinois laboratory. He is editor of the *Psychological Index* and took a prominent part in the war activities of the American Psychological Association.

BÉRAUD, HENRI 1885-). A French novelist born at Lyons. Although he began publishing in 1905, he attained prominence only recently when the Académie Goncourt crowned his two novels *La Martyre d'un Obèse* and *Peau de Fesse* (1922). The first named is a Gallic farce of the martyrdom of a fat man in love with a svelte charmer. *Le Vitriol de Lune* (1921), *L'Héritage des Symbolistes* (1905), *Les Morts Lyriques* (1912), *Textes pour l'Album, L'ux de Bib* (1921), are among his other works. M. Béraud is regarded as holding a position of promise among the *jeunes*.

BERCHTOLD, LEOPOLD, COUNT (1863-). A former Austro-Hungarian foreign minister (see VOL. III). After the outbreak of the War he tried to persuade Italy and Rumania to fulfill their obligations to Austria and bent all his energy to securing new allies for the Central Powers. He was, however, unsuccessful for the most part, as he would not consent to the concession of Austrian territory, even though Germany urged it. He came into conflict with German statesmen and military leaders on other grounds also. He accused them of not supporting Austria sufficiently against Russia. In 1915 he fell from power, and the following year was appointed Lord High Steward to Charles Francis Joseph, the heir to the throne. Later he became Lord High Chamberlain but retired from politics on the fall of the dynasty.

BEREA COLLEGE. A nonsectarian, co-educational institution at Berea, Ky., founded in 1858, in the special interest of the mountain people of the Southern Appalachians. There are five departments; the college, the normal school, the academy, the vocational school, and the foundation school, the latter for belated students still in the grades. The college department registered a growth from 104 students in 1913 to 344 in 1923-24, and the total enrollment of all the schools increased in the same period from 1736 to 2729. Six brick dormitory and educational buildings were constructed during the decade besides a hospital and detention ward accommodating 150 patients. An important weaving industry was established; also a broom industry, which in 1922-23 manufactured 7200 dozen brooms. A dairy of 100 cattle, a farm of 350 acres, a garden of 65 acres, a forest of 5600 acres, and a cannery were all operated to reduce the cost of an education, so that no student should be debarred on account of poverty. The staff of commissioned workers was increased from 101 to 146; and the number of books in the library from 26,000 to 42,600 volumes. William Goodell Frost, LL.D., who guided the college during the period of its great expansion, retired from the presidency in 1920, and was succeeded by William James Hutchins, D.D.

BERENSON, BERNARD (1865-). An American art critic (see VOL. III). His recent publications include: *Venetian Painting in America, the Fourteenth Century* (New York, 1916), and *Essays in the Study of Siennese Painting* (ib, 1918).

BERENT, WACLAW (1869-). A prominent Polish writer, born at Warsaw. Berent attracted the attention of serious literary critics

by his remarkable characterization of modern types in the novels *Fachowiec* (1903) and *Prochno* (1904), the latter a profound analysis of the metropolitan decadent artist. Other stories are *Ozmine* (1911) and *Zwe Kamienie* (1922). He made a successful début as a dramatist and has been looked on as the coming writer of Polish drama. Berent also collaborated on a Polish edition of Nietzsche.

BERESFORD, JOHN DAVIS (1873-). An English author, born at Castor, near Petersborough, and educated at Oundle and Petersborough. He studied architecture in London but gave it up to turn to writing. He has since published several plays and many novels, in which he has portrayed characters exceptionally real. His style is dry but is vitalized by unusual psychological insight. His publications include the *Jacob Stahl* trilogy; *Goslings* (1913); *The Mountains of the Moon* (1915); *These Lynnekers* (1916); *The Wonder* (1918); *The Jervaise Comedy* (1919); *The Prisoners of Hortling* (1922); and *Love's Pilgrim* (1923).

BERG, DAVID EMMANUEL (1890-). An American sociologist, born at Minneapolis, Minn., and educated at the University of Minnesota. From 1912 to 1914 he was superintendent of schools in various towns in Minnesota. In 1914 he was with the University of Wisconsin survey and in the following year was a member of the Madison (Wis.) Chamber of Commerce. In 1915-16 he was assistant director of the Bureau of Municipal Research in Akron, Ohio, in 1917 assistant secretary of the Committee on Criminal Courts of the Charity Organization Society of New York City, and from 1917 to 1921 secretary of the Charities and Welfare Committee of the Philadelphia Chamber of Commerce. He was also secretary of the Americanization Bureau and of the Philadelphia Welfare Federation. In 1918 he was lecturer on social statistics at Fordham University. During the War he fought with the American forces in France. He is author of *Pick Your Prof.* (1920) and *Personality Culture by College Faculties* (1920).

BERGEGREEN, RALPH WILHELM ALEXIS (1871-). An American essayist, born at Gloucester, Mass., and educated at Harvard University. He was cartoonist for the *Boston Sunday Globe* (1897-99), dramatic critic and editorial writer for the *Boston Budget*, a member of the editorial staff of the Boston Publicity Bureau (1902-05), and art critic for the *Boston Advertiser* (1904-07). He is the author of several volumes of humorous, informal essays and of a book of poems for children which has been compared to Stevenson's *Child's Garden of Verse*. In addition he has written a book of fanciful short stories and articles, in magazines and newspapers. His works include *The Comforts of Home* (Boston, 1918) *The Perfect Gentleman* (Boston, 1919), *The Seven Ages of Man* (Boston, 1921), *David the Dreamer* (Boston, 1922), and *Gentlemen All and Merry Companions* (Boston, 1922).

BERGER, VICTOR L. (1860-). An American Socialist politician (see Vol. III). He never became acquiescent toward the War and often wrote against it with the result that he, in company with four other Socialists, was brought to trial for violation of the Espionage Act in December, 1918. After a bitter legal battle which attracted national attention he was found guilty (Jan. 8, 1919) and sentenced to prison for 20 years. His position took on par-

ticular interest when the House of Representatives, in November, voted his exclusion from the seat to which he had been elected the year previous. In December, 1919, he was once again elected by his Milwaukee constituency and was again denied his seat. In January, 1921, the United States Supreme Court reversed his conviction; in November, 1922, the indictments against him were dismissed; and in the same month he was returned for the fourth time to Congress, this time as the only Socialist party representative. His socialist doctrine was modeled after that of the German revisionist school of Kautsky and Bernstein, and therefore he rejected Sovietism. In 1924, with Morris Hillquit and others, he supported the candidacy of Robert M. La Follette for President.

BERGER, VILHELM (1867-). An editor and author, born at Värmland, Sweden; he was educated in the high school there and later in Upsala College, N. J. He was traveling agent for Swedish-American publications (1897-1903), editor of New York *Nordstjernen* (1903-15), and office manager and director of the Swedish Lutheran Immigrant Home (1913-15) and the Swedish Augustana Home for the Aged, Brooklyn. He is the author of numerous books in Swedish, dealing especially with the problems and conditions of the Swedes in America, published from 1902 to 1918.

BERGONIE, JEAN-ALBAN (1867-1925). He graduated in medicine at the University of Bordeaux in 1883 and was later appointed professor of biological physics and electrotherapy there. Since 1893 he has edited the *Archives d'Electricité Médicale*, a periodical of great merit. Bergonie, in addition to publishing many articles on high frequency and other modalities of electricity, devised (1909) a method of treating obesity by passive exercise, in which the patient sits in a specially devised chair while his muscular system is thrown into successive contractions by faradism. This method, which the author terms passive ergography, appeared to be very successful in reducing weight without putting stout subjects to the necessity of voluntary exercise.

BERGSON, HENRI LOUIS (1859-). The most notable of contemporary French philosophers (see Vol. III). He was elected a member of the French Academy in the spring of 1914; he had already become a member of the Academy of Moral and Political Science in 1903. The War caused an interruption of his philosophic activity and he devoted his talent to the French cause. Besides publishing a pamphlet on the *Significance de la Guerre* (1915), he went twice on diplomatic missions to Washington and was instrumental in preventing the recognition of the Soviet Government by the United States. On the occasion of the San Francisco Exposition he prepared a short survey of French philosophy, published in the collection *La Science Française* 2 vols., (1915); this constituted his only scientific production during the four years of hostilities. If Bergson refrained from philosophizing in this time of stress, his fellow philosophers in Germany published numerous articles and books to prove that the Bergsonian philosophy was plagiarized from German sources, particularly from Schelling; this literature of *Schrecklichkeit* stands as mute testimony to the frailty of human reason in time of war. In 1918, the Academy having resumed its meetings, Bergson delivered an address before it on the life

and works of his predecessor, in its membership, Emile Ollivier. This was published with the *Discours de Reception* by René Doumic (1918). At the close of the War, Bergson gathered up a number of his shorter writings and published them under the title of *L'Energie Spirituelle* (1919), translated into English as *Mind Energy* (1920). He took a leave of absence from the Collège de France in 1919 in order to devote himself to philosophic writing, and at the beginning of 1922 he resigned his chair definitely. Edouard LeRoy, one of his disciples, was elected to succeed him. Bergson was at work for some time on the revision of the Gifford lectures delivered in 1912. In 1922 a short volume came out, *Durée et Simultanéité, d'après la Théorie d'Einstein*. As the title suggests, the book attempted to reconcile the theory of relativity with the Bergsonian conception of duration. M. Bergson insists that the relativity of mathematical times, which must depend necessarily on the orientation of the observer, does not preclude the existence of an absolute qualitative time, revealed by psychological introspection. He attacks therefore not the mathematical theory of Einstein but the metaphysical interpretations which have been grafted on it.

The literature on Bergson's philosophy continued to increase at a rate which makes him the subject of more commentaries than any other modern thinker except Kant. Among the recent books in English which may be consulted are H. Wildon Carr's *The Philosophy of Change* (1914); and G. W. Cunningham's *Study in the Philosophy of Bergson* (1916); J. Alexander Gunn's *Bergson* (1921); and Mrs. Karin Stephen's *The Misuse of Mind* (1922).

BERKEY, CHARLES PETER (1867-). An American geologist, born at Goshen, Ind., and educated at the University of Minnesota. In 1892-1903 he was an instructor in geology at Minnesota, and in the latter year went to Columbia, where he became a full professor in 1916. As assistant geologist to the State surveys of Minnesota and Wisconsin, he devoted special attention to the geology and mineralogy of certain Keweenaw and Cambrian areas of these States and later held a similar relation to the New York survey, for which he studied the structural and stratigraphical features of the Highlands, and the structural, areal, and engineering geology of New York City. More recently, as consulting geologist to the New York City Board of Water Supply he made an elaborate investigation of the geology of the Catskill Aqueduct region. His original researches have also included studies on the geology of Porto Rico and China.

BERKSHIRE FESTIVAL. See *Music, Chamber Music*.

BERLIN, IRVING (1888-). An American composer, born in Russia and educated in the public schools of New York City. At 16, Berlin commenced his career as a performer in the restaurants and cafés of New York. *Alexander's Rag-Time Band* (1905) established his position as the king of syncopation. He is the writer and composer of the musical plays and revues, *Watch Your Step* (1914); *Stop! Look! Listen!* (1915); *The Century Girl*, with Victor Herbert (1916); *The Ziegfeld Follies of 1918*; *The Canary*, with Ivan Caryll (1918), and many other popular song and dance successes. He is the proprietor, with Sam H. Harris, of the

Music Box (New York) and composed the score of the *Music Box Revues* for 1921, 1922, and 1923.

BERLINER, EMILE (1851-) A German-American inventor (see Vol. III). He was elected president of the District of Columbia Tuberculosis Association in 1915. In November, 1919, under his direction, his son, Henry A. Berliner, designed and used the first successful helicopter.

BERLINER, HENRY A. (1895-). An engineer, born Washington, D. C., son of the inventor Emile Berliner, and educated in Washington and at Cornell and the Massachusetts Institute of Technology. He designed, constructed, and flew the helicopter (1919) on which his father had experimented since 1903, and in 1924 was engaged in helicopter development.

BERMUDA ISLANDS. The British colony composed of approximately 350 small islands lying 518 miles east of Cape Hatteras. The area of the group is 19.3 square miles; the population, in 1922, 20,410, of whom all but 700 were Negroes. The chief town, Hamilton, on the Island of Bermuda, has a population of 7000. Barely one-third of the area was fit for cultivation and on this were planted early spring leguminous crops for the United States market. Similarly, most of the commodities imported come from the United States. The import trade totaled, in 1922, £1,266,696 (a gain of 122 per cent over 1913); and exports, 233,296 (a gain of 157 per cent over 1913). In 1922, the total tonnage cleared was 2,178,562 tons (a gain of 73 per cent over 1913). Until 1920, alcoholic liquors were exported to the United States in large quantities, but, with the coming of Prohibition and the falling off of this traffic, experiments were conducted for the conversion of the alcohol into motor spirits. The Bermudas continued to attract American tourists and winter colonists, as many as 20,000 making their residence here annually.

BERNARD, TRISTAN (1866-). A French novelist. He is the author of two outstanding novels, *L'Enfant Prodigue du Vesinet* (1920) and *Le Jeu de Massacre* (1921).

BERNARDES, ARTHUR DE SILVA (1875-). A president of Brazil, born at Vicosia, Minas Geraes. After two years at Caraca College, he became a clerk in a store at the age of 13 to earn enough to begin a college course at Ouro Preto. He maintained himself there by doing newspaper work. Later he took up law and began practice at Vicosia. He was elected to the Congress of his native state, was its first secretary, and later secretary of the treasury of Minas Geraes. In September, 1918, he was elected governor of Minas Geraes, and was occupying this position when he was made president of Brazil in 1922.

BERNAUER, RUDOLF (?-). A librettist known chiefly for his adaptation, with Carl Meinhard, of the play *Johannes Kreisler*, from *Die Wunderlichen Geschichten des Kapellmeister Kreisler*, produced in New York (1922-23). Bernauer also wrote with L. Jacobson and O. Straus the comic opera *The Chocolate Soldier*, founded on *Arms and the Man* by George Bernard Shaw and revived at the Century Theatre in 1921.

BERNHARDI, FRIEDRICH VON (1849-). A German military leader and writer, born at Petrograd. He served in the Franco-Prussian War, and from 1891 to 1894 was at Berne as

military attaché; later he went to Berlin as head of the history department of the Grand General Staff. He was general of cavalry and commander of the 7th Army Corps from 1907 to 1909, retiring in the latter year to write on military subjects. He attracted international attention by his book, *Germany and the Next War* (1912). At the outbreak of the War he was again given command of an army corps and served with distinction on the Stochod and on the western front. He published in English *Cavalry in War and Peace* (1910); *On War of To-day* (1914), and *Britain as Germany's Vassal* (1914).

BERNHARDT, SARAH (1844-1923). A French actress (see VOL. III). In 1914, at the age of 70, the great tragedian was forced to undergo a leg amputation. Despite this disability she refused to abandon the stage. She carried out a successful tour of America in 1915, and on returning to France she played in her own productions almost continuously until her death, March 26, 1923. Her later successes included *Daniel* (1920), *La Gloire* (1921), and *Regine Armand* (1922). Her physical condition confined her practically to immobility on the stage, but the charm of her voice, which had altered little with age, insured her triumphs.

BERNHEIM, BERTRAM MOSES (1880-). An American surgeon, born at Paducah, Ky., and educated at Johns Hopkins and abroad. He is known for his original work in blood transfusion and surgery of blood vessels. During the World War he served with the Johns Hopkins Hospital Base Unit. He is the author of *Blood Transfusion* (1917), *Surgery of the Vascular System* (1913), and a volume of his experiences at the war front, *Passed as Censored* (1918).

BERNHEIM, HIPPOLYTE (1840-1919). A French physician, renowned for his development of our knowledge of suggestion as a cause and remedy for disease. With his chief, Liébeault, he founded the so-called Nancy school of psychotherapeutics, although he remained throughout a general practitioner of medicine and professor of medicine in the local university. His books have been widely translated and his clinic at Nancy visited by physicians from many countries. His first book, devoted to general medicine, *Leçons de Clinique Médicale*, appeared in 1877 and was translated into Spanish. His first work on suggestion, *De la Suggestion et de Ses Applications à la Thérapeutique* (1888), was translated into German by Freud and also into English. *Hypnotisme, Suggestion et Psychothérapie* appeared in 1891; *L'Hystérie* (1913); *L'aphasie* (1914), and *Automatisme et Suggestion* (1917).

BERNSTEIN, EDUARD (1850-). A German politician (see VOL. III). In 1920 he was again elected to the Reichstag and became Town Councillor of Berlin. He also published a new edition of his book *Voraussetzung des Sozialismus und Anfang der Sozialdemokratie* (1915), besides *Völkerrecht und Völker-Politik* (1919) and *Wirtschaftswesen und Wirtschaftsuerden* (1920).

BERNSTEIN, ELSA ("ERNST ROSMER") (1866-). A German dramatist born at Vienna. Frau Bernstein is the daughter of Heinrich Porges, a writer on music and one of the earliest champions of Wagner, and the wife of Dr. Max Bernstein, a prominent lawyer and successful playwright of Munich. She was an

actress but left the stage on account of failing eyesight and wrote the dramas *Wir Drei* (1893) and *Dämmerung* (1894), and a volume of stories, *Madonna*. Her greatest success was achieved with the poetical drama *Königskinder* (1899), which was played by Sir Arthur Harvey and his company in New York under the title *Children of the King*. The play was made the libretto of Humperdinck's opera *Königskinder*, in which Geraldine Farrar excelled as the Goose-girl. Other works of Frau Bernstein are *Tedeum*, a comedy of musical life, the tragedies *Themistocles* and *Achilles* (1910), and the dramas *Dagny*, *Merele*, *Johannes Herkner*, *Mutter Maria* (1900), *Nausikaa* (1906), *Maria Arndt* (1908), and *Schicksal* (1914).

BERNSTEIN, HENRY LEON GUSTAVE CHARLES (1875-). A French dramatist (see VOL. III). He continued to occupy a leading position among writers of high-class theatrical thrillers. His war play, *L'Élévation*, was acclaimed in France as a work of genuine sincerity, and in the United States, where it was produced with Grace George in the season 1917-18, it was hailed as a drama of spiritual rebirth. The play dealt with the customary French triangle and attempted to show a purification of emotions in the white heat of the War. No doubt the plot had the appearance of sincerity, but the piece was an example of self-deception induced by the war fever. Another play by Bernstein, *The Claw*, was produced in 1921 with Lionel Barrymore and Irene Fenwick in the leading rôles. It was a vigorous character study of a French statesman fallen into moral decay and was built up with effective situations.

BERNSTEIN, HERMAN (1876-). An American journalist and translator of Russian literature. He was born at Neustadt-Scherwindt, Poland, of Russian parents, and emigrated to the United States in 1893. He visited Europe at various times during a long period of years as special correspondent of American newspapers including the *New York Times*, which he represented during 1908-12 and again in 1915, when he made a study of the conditions of the Jews in the war-stricken countries; the *New York Herald*, 1917-19, in Russia, Siberia, Czecho-Slovakia, Poland, and at the Paris Peace Conference; and the *New York American* (1920-21). He was founder and editor of *The Day* (1914-16) and editor-in-chief of *The American Hebrew* (1916-19), to which he returned in 1923 as editor. He began by writing poems and a novel of orthodox Jewish family life (*Contrite Hearts*) but is better known for his translations of Russian authors, especially Andréev, and for his discovery and publication of the secret telegrams exchanged between the Czar and the Kaiser (1904-07), known as the *Willy-Nicky Correspondence*.

BERNSTORFF, JOHANN-HEINRICH A., COUNT VON (1862-). A German diplomat, ambassador plenipotentiary to the United States from 1908 until the entrance of the latter into the World War (see VOL. III).

BERRY, EDWARD WILBER (1875-). An American paleobotanist, born at Newark, N. J., and educated privately. In 1897 he became associated in the management of the *Passaic Daily News*; he was later president of the company publishing it. In 1905 he entered Johns Hopkins University, where he soon became a member of the teaching staff and in 1917 pro-

fessor of palaeobotany, a subject on which he is accepted as one of the foremost authorities in the United States, specializing on the plants and geological history of southeastern North America, in connection with which he has traveled extensively in those regions. In 1919 he visited South America as a member of the Williams Memorial Expedition. Since 1910 he has been associated with the United States Geological Survey and has contributed to its publications important memoirs on *The Upper Cretaceous and Eocene Floras of South Carolina and Georgia* (1914) and *The Lower Eocene Floras of Southeastern North America* (1919). He has published reports to the Maryland State Geological Survey on *Lower Cretaceous of Maryland* (1911) and *Upper Cretaceous of Maryland* (1916). After 1917 he held the office of assistant State Geologist on that Survey. In 1901 he received the Walker Prize of the Boston Society of Natural History. He belongs to many scientific societies in the United States and abroad, including the Palaeontological Society of America, of which he was president in 1924; the Geological Society of America, of which he was vice-president in 1924; and the National Academy of Sciences, to which he was elected in 1922. He is the author of more than two hundred scientific papers and a book, *Tree Ancestors* (1923).

BERTHELOT, PHILIPPE JOSEPH LOUIS (1866-). A French diplomat and son of Marcellin Berthelot, the famous savant and statesman. He passed through the regular apprenticeship of the diplomatic career and was sent on a mission to the Far East in 1902. He returned to the Foreign Office and advanced rapidly to the position of *Chef de Cabinet* and finally to director-general of the Quai d'Orsay. From this post he ruled French foreign policy and was trusted alike by Clémenceau, Millerand, and Leygues. During Leygues' premiership he exceeded his power and sent a telegram in the premier's name instructing the French ambassador in London to ask the Bank of England to assist the Banque Industriel de Chine. This telegram was made the subject of a subsequent interpellation in the Chamber of Deputies, and Premier Briand was compelled in March, 1922, to put Berthelot on the retired list for 10 years. Despite this political scandal, Berthelot was recognized by friends and foes alike as one of the ablest diplomats in France.

BERTOLINI, PIETRO (1853-1920). An Italian statesman, born at Montebelluna. He devoted himself to economic and administrative questions and represented his native town in the Italian Parliament (1891). After an active career in which he held various public offices and was at one time Minister of Public Works (1907) and at another Minister of the Colonies (1912), he became a supporter of the extension of the suffrage bill and devised a worthy system for allowing illiterates to vote and at the same time reducing electoral corruption. He remained in retirement during the War and was afterward appointed Senator and headed the Italian delegation at the Reparations Commission. He is the author of several important works on politics and economy and on local government in England.

BERTRAND, LOUIS (1866-). A French novelist, disciple of Flaubert. He sought to continue the naturalistic and psychological novel. *Sanguis Martyrum* (1918) shares the Carthagin-

ian setting and even the general perspective of Flaubert's *Salammô*. Bertrand, however, has not attempted to be completely historical and is satisfied with portraying emotions which were the same in the days of the War as in those of the Christian martyrs. His works include a biography, *Flaubert à Paris, ou le Mort Vivant* (1921), and the novels *Les Villes d'Or*, *L'Infante* (1920), *Le Rival de Don Juan*, *Bains de Phalère* (1921), and *Cardemmo* (1922).

BERWALD, WILLIAM (1864-). An American conductor, born at Schwerin, Germany. A pupil of Rheinberger and Faiszt, he began his career as conductor of the Philharmonic Society at Libau in Russia. In 1892 he settled in Syracuse, N. Y., where he has since been head of the department of musical theory at the University. In 1922 he was appointed conductor of the newly organized Syracuse Symphony Orchestra. As a composer he is known by his cantatas, *The Seven Last Words of Christ* and *Crucifixion and Resurrection*; two overtures for orchestra; chamber music; and many songs and pieces for piano.

BÉSELER, HANS VON (1850-). A German soldier, born at Greifswald in Prussia. In the War he led the assault on Antwerp, which he took on Oct. 9, 1914. With the occupation of Poland in 1915 he became German governor at Warsaw where his attempts to set up a Polish national government buttressed by German arms met with only slight success. In 1918 the Armistice ended his activities.

BESNARD, PAUL ALBERT (1849-). A French painter (see VOL. III). He was head of the French School at Rome in 1913-21 and director of the Ecole des Beaux Arts since 1922. He was represented in the official exhibition of French art held in the United States in 1919-20 by a symbolic portrait of Cardinal Mercier. An important exhibition of his works was shown in different cities of the United States in 1924.

BESSARABIA. A former government of the Russian Empire but since 1920 a Rumanian province. It has an area of 17,146 square miles, an estimated population (1919) of 2,344,800, and is a country of rich cereal lands. The population is of a mixed character containing large communities, in the southern districts, of Ukrainians and Germans, as well as considerable numbers of Jews, Poles, Bulgars, Armenians, and Tatars. The collapse of the Russian Empire in 1917 gave impetus to the separatist movement, which had long attracted the enthusiasm of the Rumanians in the province, with the result that a request was made to the new republican government for the establishment of an autonomous Bessarabia. But the success of the Bolshevik revolution encouraged the Rumanians to hope for loftier things. On Dec. 15, 1917, a "Council of the Land" proclaimed Bessarabia free, under the name "Moldavian Republic." Its independence, however, was short-lived. The hostility of the Ukrainians prompted the Rumanian government to send an army into the country and commence a carefully fostered agitation for annexation. From January, 1918, on, in spite of an Allied attempt in March to bring Rumania and Soviet Russia to terms, the Rumanians remained in occupation of the country. The Bessarabian National Council, which was erected by the Rumanians, twice, in 1918, asked for annexation to Rumania. While sweeping promises of political and religious liberties were held out to the people and the estates of

the large landowners were proceeded against, dissent was treated with a high hand: deportations and imprisonments were frequent; local governments were dissolved; Bessarabian judges were dismissed and the courts closed. Conversations were carried on between Russia and Rumania in 1919 and 1920, but unknown to Russia, Rumania at the very moment was secretly treating with the Allies. On Oct. 28, 1920, a treaty was signed by which Great Britain, France, Italy, and Japan recognized Rumania's sovereignty over Bessarabia. To 1924, however, only the British government had given formal assent to the treaty. In spite of the protests of the Soviet government that it could not recognize the validity of a treaty concerning Bessarabia which had been signed without its participation and to which only foreign powers were signatories, no warlike measures were taken. However, that the matter was not closed was seen in the frequency with which Russia complained, throughout 1920-23, of irregularities on the frontier and in the control of the Dniester River, and of raiding parties originating in Bessarabia, etc. In October, 1921, commissioners of both countries met at Warsaw in an attempt to resume friendly relations but the conference soon collapsed. The same was true of the Vienna conference held early in 1924. Russia regarded French interests in Rumanian affairs with suspicion; Rumania demanded, before any agreement was to be reached, the return of some \$80,000,000 in Rumanian treasure which had been sent to Russia for safekeeping during the War. In short, animosities still existed on both sides; no solution seemed in sight in 1924, and at any moment it appeared that the hatreds might be fanned into war. The attempts, in April, 1924, of the Rumanian king to negotiate a defensive treaty with France, whose purpose could be only the maintenance of Rumanian sovereignty in Bessarabia, were regarded with breathless interest by the western world. For France to take such a course meant only one thing: the possibility of war with Russia.

BEST, HARRY (1880-). An American sociologist, especially interested in the problem of the deaf, dumb and the blind. He was born at Millersburg, Ky., and educated at Centre College, Danville, Ky., George Washington University, Gallaudet College (Washington), Columbia University, and the New York Law School. Before 1912 he held various instructorships in schools and colleges for the deaf and dumb. He was a resident worker in the University Settlement in New York from 1912 to 1919, and in the latter year became professor of sociology in the University of Kentucky. He is the author of two standard texts, *The Deaf* (1914) and *The Blind* (1919), and of contributions to periodicals.

BESTOR, ARTHUR EUGENE (1879-). A president of Chautauqua Institution, born at Dixon, Ill., and educated at the University of Chicago. He was professor of history and political science at Franklin College, Ind., 1901-03, and lecturer on political science in the Extension Division of the University of Chicago, 1904-12. He was assistant general director of Chautauqua Institution, 1905-07; director, 1907-15, and since 1915, president. During the period 1917-18 he was chairman of the Committee on Lectures and Entertainments in the Training Camps of the National War Work Council of the Y. M. C. A.

and director of the speaking division of the Committee on Public Information.

BETHELEHEM BACH FESTIVAL. See *Music, Festivals*.

BETHMANN-HOLLWEG, THEOBALD VON (1856-1921). A German statesman and Chancellor of the German Empire, 1909-17 (see Vol. III). As chancellor, Bethmann-Hollweg's place in domestic and foreign affairs was decidedly subordinate; his movements were continually being circumscribed by the caprices of his royal master and the intrigues of the military party led by von Tirpitz. He entertained the same ambitions for Germany's expansion as all Germans of the ruling class and regarded the violation of the Belgian treaty and the declarations of war which followed it with complacency. To his credit, he refused to accede to the unlimited submarine warfare inaugurated in 1917. His compromising and equivocal attitude satisfied neither his masters nor his critics. When the military command attempted in July, 1917, to interfere in affairs which he regarded as peculiarly his own, he handed in his resignation. He retired from public life to Hohenfinow, where, after preparing *Reflections on the World War* (1919), he died on Jan. 1, 1921. See GERMANY, *History*.

BETTELHEIM, ANTON (1851-). An Austrian author (see Vol. III). In 1917 he published *Leben und Wirken des Freiherrn Roch, von Lilencron, mit Beiträgen zur Geschichte der Allgemeinen Deutschen-Biographie* (New Series, 1919, with Ludwig Augengruber).

BETTS, LOUIS (1873-). An American portrait painter, born at Little Rock, Ark., who was the pupil of his father, E. D. Betts, Sr., of William Chase, and of the Art Institute (Chicago). He was elected an Associate Member of the National Academy in 1912 and a full member in 1915. He is also a member of the National Institute of Arts and Letters. Louis Betts, who began painting as a child, received the Cresson Travelling Fellowship from the Pennsylvania Academy of Design after studying with Chase and went to Europe to familiarize himself with the work of Franz Hals and Velasquez. He attracted attention as a copyist. His portraits are painted with regard to emphasizing character above everything else, and he gains his effects without the use of accessories or non-essentials. He has painted portraits in Chicago, New York, London, Paris, Amsterdam, and Madrid, and his work is represented in the permanent collections of the National Arts Club and the Art Institute of Chicago.

BEVERIDGE, ALBERT JEREMIAH (1862-1927). An American politician and lawyer (see Vol. III). Since 1915 he has published *What Is Back of the War?* and *A Life of John Marshall*, 4 vols. (1916-19).

BEWER, JULIUS AUGUST (1877-). A professor of theology, born at Ratingen, Germany, and educated at the Royal Gymnasium (Düsseldorf), Union Theological Seminary (New York), and the universities of Basel, Halle, and Berlin. He was professor of Old Testament language and literature at the Oberlin (Ohio) Theological Seminary (1902-04), becoming ordained two years later in the Congregational ministry. He was called to Union Theological Seminary in 1904 as assistant professor of Biblical philology. In 1914 he was made professor. He became a member of the faculty of philology of Columbia University in 1913 and lecturer at

Teachers' College in 1912. He is author of several critical essays on the Old and New Testaments.

BEWLEY, LUTHER BOONE (1876-). An American educator in the Philippine Islands. He was born at Mosheim, Tenn., and educated at Maryville College. In 1902 he went to the Philippines as a teacher and held various positions until he was appointed superintendent of schools in Manila in 1914. He became director of education in the Philippine Islands in 1919.

BEYERLEIN, FRANZ ADAM (1871-). A German novelist and playwright (see VOL. III). He is author of *O Deutschland, Heiliges Vaterland*, a novel (1915); *Der Philister*, essays (1919); and *Besuch*, four one-act plays (1919).

BIANCHI, LEONARDO B. (1848-1916). A distinguished Italian alienist who became Minister of Public Instruction for Italy. Born in San Bartolomeo he received his M.D. from the University of Naples in 1871. After holding several minor chairs in his alma mater he became clinical professor of psychiatry and neuropathology and was for years director of the Provincial Asylum at Naples. He is the author of treatises on neurological subjects which include *L'Emiplegia* (1886); *Semeiotica delle Malattie del Systeme Nervosa* (1891); *Malattie del Cervello* (undated). In 1905 appeared the *Trattato de Psichiatria* which was at once translated into English, the translator stating that in knowledge of the physiology of the brain, normal and morbid, it was superior to any textbook in English. Not until 1920, four years after his death, did another distinctive work by Bianchi appear, *La Meccanica del Cervello e la Funzione dei Lobi Frontali*. This was also translated into English by MacDonald of Glasgow in 1921.

BIBESCO, PRINCE ANTOINE (?-). A Rumanian minister to the United States and the husband of Elizabeth Asquith, the daughter of the former British Premier. He was educated in France, and later served as counselor to the Rumanian Legations in London, Petrograd, and Paris. In 1921 he was made Envoy Extraordinary and Minister Plenipotentiary from Rumania to the United States.

BIBLE SOCIETY, AMERICAN. A society founded in 1816 which strives for a world circulation of the Bible to all people without denominational or racial discrimination. The Bibles were furnished at cost price and distributed at cost price through the society's home, foreign, and other agencies. The Scriptures issued by the society in 1923 totaled 7,101,289 volumes; 3,856,199 from the Bible House, New York, and 3,245,090 in foreign lands. These Scriptures were in 175 different languages. During the War, from August, 1914, to the end of 1919 the society distributed 6,808,301 copies of the Bible free of cost among the armed forces of the belligerent nations; of these 4,920,543 were given to men in the service of the United States, and 1,887,758 to those of other nations. The translation and revision of the Bible in other languages was an important part of its work. A translation of the whole Bible into Mandarin was finished in 1919; the Portuguese version was completely revised in 1917; a revision of the Spanish New Testament was issued in 1923, as was the New Testament in Bolivian Quechua; and portions of the Bible were translated into several other tongues. The official publication

of the organization was the monthly *Bible Society Record*.

BIDDLE, ANTHONY J. DREXEL (1874-). An American author, born at Philadelphia and educated at Heidelberg. He lived in the Madeira Islands for a number of years, studying conditions there, and returning to the United States in 1891, when he took up editorial work. He was first on the staff of the *Philadelphia Public Ledger* and in 1895 became editor of the *Philadelphia Sunday Graphic*, which he revived. From 1895 to 1904 he was head of the publishing house of Drexel Biddle (New York, San Francisco, and Philadelphia), and founded the Drexel Biddle Bible Classes in the United States, the West Indies, Great Britain, and Canada. In 1918 he was in France as Marine Corps Captain of the Reserve Forces. He is the author of several novels, but his most important work is *The Madeira Islands* (1900), an account of the history, customs, inhabitants, etc., which has, however, been criticized as biased and exaggerated.

BIDDLE, CHARLES J. (1890-). An American Ace, officially credited with the destruction of eight enemy airplanes during the War. He recently wrote *The Way of the Eagle*. He was trained in French aviation schools and was in active service, 1917-19. He won high honors including the Distinguished Service Cross, the French Legion of Honor, Croix de Guerre with four palms, and the Belgian Order of Leopold.

BIER, AUGUST C. G. (1861-). A prominent German surgeon (see VOL. III) and professor of surgery in the University of Berlin, who recently published many articles founded largely on his military experiences. His favorite subject is regeneration in the human body. In 1917 an edition appeared of *Chirurgische Operationslehre* by Bier, Braun and Kummel.

BIERSTADT, EDWARD HALE (1891-). An American author and editor, born in New York City and educated at the Taft school at Watertown, Conn. He has held various editorial positions with publishing firms, including the Century Company, and was editor of the *Opera Magazine* (1914-1915). In addition to frequent contributions to *The Bookman*, *New Republic*, etc., he is the author of *Dunsany, the Dramatist* (1917), *Aspects of Americanization* (1922), *Sounding Brass* (1922), and *Lost Trails of the Spanish Main* (1922). He edited *Three Plays of the Argentine* (1920), *Portmanteau Plays* by Stuart Walker (1919), and *More Portmanteau Plays* (1919).

BIG BERTHAS. See ARTILLERY.

"BIG FOUR." See PEACE CONFERENCE AND TREATIES.

BIGGERS, EARL DERR (1884-). An American author born at Warren, Ohio, and educated at Harvard. From 1908 to 1911 he was identified with the *Boston Traveler* as conductor of a humorous column and dramatic critic. He has written *If You're only Human* (1913); *Thieves*, with Grover Harrison (1913); *Inside the Lines* (1915); *A Cure For Curables*, with William Hodge (1917), *See-saw* (1919), and the popular novel, *Seven Keys To Baldpate*, dramatized by George M. Cohan (1913).

BIGGS, HERMANN MICHAEL (1859-1923). An American physician (see VOL. III) who was distinguished as a clinician, pathologist, bacteriologist, and sanitary officer. In 1914 he became State Commissioner of Health for New

York. He was appointed medical director of the General League of Red Cross Societies at Geneva in 1920 and was knighted by the King of Spain for services in preventive medicine.

BILLIARDS. See SPORTS.

BILLINGS, FRANK (1854-). (See VOL. III). Dr. Billings summed up his doctrines in a monograph *Focal Infection* (the Lane Medical Lectures) in 1916 and with Salisbury has completed the reference work *General Medicine*, 15 vol. (1918). During the War he served in the American Expeditionary Force as chief provost marshal, attached to the office of Surgeon General.

BINET SCALE. See MENTAL MEASUREMENT.

BINET-VALMER, GUSTAVE (1875-). A French novelist. He is the very popular author of more than a dozen novels. These include *La Passion* (1914); *Le Mendiant Magnifique* (1919); *Antonine Jassart, Veuve* (1921); *L'Enfant qui Meurt* (1921); *Les Seigneurs, les Dames, et les Petits Messieurs* (1922); and *Les Jours sans Gloire* (1922).

BINGHAM, HIRAM (?-). A professor of Latin-American history at Yale. Well known for his recent books on aviation and other subjects. These include *Five Straws, Journal of an Expedition across Venezuela and Colombia*; *Across South America*; *The Monroe Doctrine an Obsolete Shibboleth*; *Vitcos, the Last Inca Capital*; *The Wonderland of Peru*, and *An Explorer in the Air Service*. He also organized the United States Schools of Military Aeronautics and was on active service 1917-19.

BINGHAM, JOSEPH WALTER (1878-). An American professor of law, born at Indianapolis and educated at the University of Chicago. He was admitted to the Illinois bar in 1904 and practiced in Chicago during the following year. He was acting assistant professor of law at Cornell University, 1905-07, and at Stanford University, 1907-08, becoming professor in the latter institution, in 1912. In 1918 he was assistant director of the Bureau of War Trade Intelligence of the War Trade Board. He is author of *Cases on the Law of Water Rights* (1916) and articles in law journals.

BINGHAM, WALTER VAN DYKE (1880-). An American psychologist born at Swan Lake, Iowa. He was educated at the University of Chicago and the University of Berlin and devoted himself to educational and applied psychology. He taught at the University of Chicago; Teachers' College, Columbia University; and Dartmouth College. Since 1915 he has been the head of the division of applied psychology of the Carnegie Institute of Technology and has carried out a number of researches regarding the application of psychological theory to education and in business advertising. During the War, Professor Bingham served as executive secretary of the committee on the classification of personnel and was made Lieutenant-Colonel on the General Staff of the United States Army.

BINSWANGER, OTTO LUDWIG (1852-). A distinguished German neurologist born at Münsterlingen, Switzerland, who received his medical degree from the University of Königsberg in 1878, took up the study of neurology and psychiatry, and in 1882 was appointed professor in these branches in the University of Jena and director of the Grand Ducal Insane Asylum. In 1911 he became rector of the Uni-

versity. Binswanger is known chiefly for his exhaustive treatises on various nervous affections, *Die Pathologie und Therapie der Neurosen* (1896), *Die Epilepsie* (1899); and *Die Hysterie* (1904). Finally, in collaboration with Siemerling, he published his *Lehrbuch der Psychiatrie* (1907) and also edited the periodical *Epilepsia*, 1909-14. His three treatises named above were translated into English as volumes of Nothnagel's *Special Pathology and Therapy*.

BIOCHEMISTRY. This subject has been defined as the chemistry of physiology and hence is naturally subdivided into the chemical phenomena of the separate functions of living organisms, as digestion, respiration, metabolism, etc. Biochemistry, however, is a much more comprehensive subject, for it comprises the chemical composition of animal tissues, agricultural and plant chemistry, physico-chemistry of the body including electrochemical reactions, the chemistry of foods, the chemistry of disease processes and products, the chemical aspect of therapeutics, etc., etc. Since most of these subdivisions are separately considered, the subject of biochemistry is regarded by some authorities as an artificial one. These authors retain the old name of physiological chemistry and narrow the scope to the dynamic chemistry of the animal functions, although these should be found intact in any good work on physiology. The chief use of the term Biochemistry may be to call attention to certain subjects which do not receive proper attention in works on physiology and of these there are not a few. There is, for example, the subject of the animal syntheses, which originated almost a century ago when Wohler first formed urea from extranimal sources. Akin to this laboratory activity is the isolation of definite chemical bodies from animal tissues. Both animal synthesis and isolation of active principles have been going ahead steadily up to the present time and as a result we have long series of products which comprise adrenalin, synthetic suprarenin, thyroxin, etc. Thus far it well appears that in the narrower and technical sense, biochemistry really means laboratory analysis and synthesis which does not differ essentially from any other organic analysis and synthesis.

At one period in the history of physiology, advance in this science was at a standstill, until Liebig and other chemists helped materially in its development. Despite the fact that much of Liebig's teaching has been found erroneous, physiology has from that period largely assimilated animal chemistry. Another important phase of organic analysis and synthesis has to do with the protein substances and their dissociation into various aminoacids and polypeptides, some of which have specific nutritive and growth-promoting functions. In this connection it has been possible to nourish certain animals over considerable periods with inorganic nitrogen in place of protein matter. Fischer, who was one of the most active discoverers in this field, was similarly successful in the study of carbohydrates and in showing the practicability of using inorganic carbon in the diet. In the study of ferments, internal secretions and vitamins, inability to isolate the actual active principles—with a few exceptions—may keep this department out of biochemistry and leave it in the hands of physiology.

In like manner the subject of immunology and of preventive and curative sera remains within

the confines of experimental and practical medicine. The comparatively new study of physical chemistry which has numerous practical applications in physiology and medicine, is now covered in works on biochemistry with special reference to the optimum concentration of mineral matter in the fluids, the acid-alkaline balance and the subjects of hydrogen-ion concentration and acidosis. The art of diagnosis has been greatly enriched by numerous tests which are decidedly of biochemical character. Under therapeutics we see that withholding salt from the diet will rapidly clear up the severest dropsies, while the addition of a little iodine to the diet will prevent simple endemic goitre and the injection of alkalis will at times combat severe conditions due to acidosis.

From what has already been mentioned it is easy to form the impression that the word biochemistry should be limited to our knowledge of exact substances which can be isolated and employed in pure state. Thus construed it should be a simple matter to distinguish between chemistry on the one hand and physiology and other subjects on the other.

BIOLOGY. A term first applied by Lamarck in 1801 and Treviranus in 1802 to that study of living beings which differs in its point of view from either botany or zoology in that more attention is given to the fundamental laws of life and less to details of anatomy and classification. Obviously this branch of science assumed especial importance after 1859 when the evolution hypothesis furnished an interpretation for the resemblances which appear between the structures and activities of all living beings. In more recent years the term Biology has been used with two distinct meanings. On the one hand, General Biology deals with both plants and animals and uses representatives of either group according as one or the other better illustrates the principles under consideration; while on the other hand the distinction between plants and animals is retained and Animal Biology and Plant Biology are treated as distinct subjects, the word "biology" being here understood to mean a study of plants or animals respectively, deriving from a comprehensive examination of the anatomy, embryology, ecology, paleontology and classification of either group of conclusions as to the fundamental principles underlying their structures, their activities, their relations to one another and their ancestral history.

As a result of intensive investigation along these anatomical, physiological and other lines, each of these subdivisions of the subject has acquired the importance of a distinct science with its own technique and its own vocabulary. Moreover, it soon became evident that chemical reactions certainly accompany and probably play an important part in all life processes, so that the chemist has been called on to develop Biochemistry as an aid to further analysis of vital processes. Hence it follows that we have at the present time no such thing as a science of biology but rather a group of biological sciences all dealing with living matter and coöperating in the attempt to answer some fundamental biological problems: e.g.—What is the nature of living matter?—How may it have originated on the earth and to what extent is "life" a physical and chemical process?—How does living matter adjust itself to its environmental conditions?—If the present life of the earth

has evolved from earlier life, what are the forces which have produced these modifications?—What are the laws according to which the peculiar characteristics of living beings are transmitted to their descendants? While for purposes of instruction it is common practice to group the most important of these conclusions into a summary called biology, these biological sciences really differ so much from one another that they are best treated under distinct heads as given below. See ANATOMY, ANTHROPOLOGY, BIOCHEMISTRY, BOTANY, ECOLOGY; HEREDITY; ZOOLOGY, EVOLUTION. For an excellent brief summary of the subject consult *General Biology* by Burlingame, Heath, Martin and Pierce.

BIOMETRY. See HEREDITY

BIRGE, EDWARD ASAHEL (1851–). An American educator (see VOL. III). He was chosen president of the University of Wisconsin in December, 1918. From 1897 to 1919 he was director of the Geological and Natural History Survey of Wisconsin, and from the latter date, president of the commission. He was one of the Conservation Commissioners, 1908–18 and in 1918 became president of the United Chapters of Phi Beta Kappa. He was the author of many books on zoölogy and limnology. Professor Birge's researches were mainly on the fauna of fresh-water lakes and the biology of the floating forms.

BIRMINGHAM. The largest city of Alabama. The population rose from 132,685 in 1910 to 178,806 in 1920, and to 223,507 by local estimate for 1924. A \$750,000 municipal auditorium and \$1,000,000 post office were built. In 1924, a \$3,500,000 bond issue was voted by the city for public school improvements, and \$650,000 for the public library. In 1922, a new fire-alarm system was put in service; and in 1924 a light and bell signal system for regulating downtown traffic. The number of manufacturing plants increased from 274 in 1914 to 565 in 1924, and the mining companies in the district from 48 to 141. Building permits increased also from 3524, valued at \$3,043,374 to 5390 valued at \$12,166,946; bank clearings from \$155,674,395.84 to \$1,305,871,257, and the weekly payroll from \$1,500,000 to \$3,125,000. Assessed valuation of real and personal property, based on a valuation of 60 per cent, increased from \$95,458,826 in 1914 to \$145,737,466 in 1924.

BIRNEY, LAURESS J. (1871–). An American bishop, born at Dennison, Ohio, and educated at Scio College and at the Boston University School of Theology. From 1895 until 1911 he was pastor of various Methodist churches in Ohio and Massachusetts. He was dean of the Boston University School of Theology from 1911 to 1920, and was elected bishop, in the latter year.

BIRRELL, RT. HON. AUGUSTINE (1850–). An English author and public official (see VOL. III). He was secretary for Ireland from 1907 to 1916, and under his rule the Irish Universities Act, the Irish Land Act, and the Home Rule Act were passed by Parliament. At the outbreak of the government rebellion, Easter 1916, he resigned. Although active in politics for many years, Birrell is better known as a writer of essays and of biographies. He published *Frederick Locker-Lampson*, a biography, in 1920.

BIRTH CONTROL. The World War synchronized with an almost world-wide awakening

of avowed public interest in the political, ethical, medical and practical aspects of family limitation. This was probably due fundamentally to a realization that international competition tended to be intensified by population pressure. It was realized that the open spaces of the earth are now small and relatively unattractive as compared with those into which the European stock had expanded during the nineteenth century. Moreover, the advancement in the complexity of social life with the resultant expansion of wants and especially the increasing freedom of women had brought into vigorous operation powerful social-psychological forces favoring the public discussion of birth control. A complete survey would show that there was no advanced country in Orient or Occident in which the subject was not agitated during the decade under review and especially since 1919.

American Movement. Active propaganda for birth-control began in the United States with the publication in 1924 by Mrs. Margaret Sanger of a magazine, *The Woman Rebel*, in which the use of preventive methods was advocated. Her indictment under the Federal law forbidding the sending of "improper matter" through the mail, the repeated postponement of her trial and the final quashing of the proceedings in February, 1916, gave wide publicity to the propaganda. The same may be said of the arrest and the sentence to thirty days in the workhouse of Mrs. Sanger and her sister for activities connected with a "birth control clinic" established in Brooklyn. The case was appealed and reached the Federal Supreme Court in October, 1919; it was dismissed on the ground of no jurisdiction. Interested persons by 1916 had formed the National Birth Control League; also a supporting Woman's Committee of One Hundred, headed by Mrs. Amos Pinchot, and the Committee of One Thousand, headed by Dr. Ira S. Wile. Birth Control Leagues were rapidly formed in more than a score of the larger cities during 1916 and 1917. Various other arrests in 1916 brought forward the issue of freedom of speech and press and led to the formation of the Free Speech League, headed by Leonard P. Abbott, interested in preserving the constitutional guarantees of liberty of expression. By the close of that year the propaganda was well organized, country-wide, and well supported. Every activity of the promoters was considered by the press to have considerable news value and the more decided the opposition the greater the publicity. While the drama and the motion picture were used to aid the propaganda, the most effective means were public addresses, public debates, the publication of the *Birth Control Review* (first issue, February 1917), and the distribution of leaflets. Considerable support was given the movement by its endorsement in October 1920 by the New York State Federation of Women's Clubs by a vote of 149 to 97. Many efforts to secure repeal of existing legislation, both State and Federal, proved ineffective.

In November, 1921, was formed the American Birth Control League, 104 Fifth Avenue, New York City, Margaret Sanger, president. The League organized the First American Birth Control Conference at New York, Nov. 11-18, 1921. One of the sessions was broken up by the police, as inquiry revealed, at the request of the office of the Catholic Archbishop. The city

council of Syracuse, New York, passed a resolution prohibiting the holding of the State Birth Control Conference there in February, 1924; the resolution was vetoed by the mayor after many elements in the community had been aroused over the free speech issue. The League held notable conferences at New York, November 1921, Philadelphia, January 1922, Cincinnati, November 1922, Albany, January 1923, and Chicago, October 1923 and is arranging the Sixth International Congress on Birth Control to be held in this country in 1925. In the year ending June 1924 it distributed 610,000 pieces of free literature, published 114,000 copies of the *Birth Control Review*, enrolled 15,000 new members and held meetings in 33 cities.

The Voluntary Parenthood League with Mrs. Mary Ware Dennett as director and headquarters at 10 West 44th Street, New York City, was formed in 1919. It began the publication of *The Birth Control Herald* in 1923. Its objects are: "1. To render available for the people's need, the best scientific knowledge as to how parenthood may be voluntary rather than accidental; and, as a first step the removal of the words 'prevention of conception' from the Federal obscenity laws. 2. The education of parents."

International. At the present time national organizations are found in England (founded in 1877), Holland (1885), Germany (1889), France (1895), Spain (1904), Belgium (1906), Switzerland (1908), Czechoslovakia (Bohemia) (1901), Portugal, Brazil (1905), Cuba (1907), Sweden (1911), Italy (1913), Algeria, Mexico (1918), and Japan (1921). These bodies constitute the Federation of Neo-Malthusian Leagues of which Dr. Alice Drysdale Vickery, London, is president. In 1922 Mrs. Sanger made a world tour in which she visited most of the countries of the northern hemisphere. The establishment of an organized movement in Mexico was soon followed by increased interest in South America.

In Europe increased activity and growing favor for propaganda were manifest in England, Germany and Austria, but not in France. In England widespread interest was aroused by the reports (see *Literature* below) of the first and second National Birth Rate Commissions organized by the National Council of Public Morals. These reports constitute a compendium of religious, social, medical and biological opinion for and against. Religious opinion in England appears divided, though the Catholics present the same opposition there as in this country. Medical and scientific opinion, as also of social workers, is overwhelmingly favorable. Great publicity was secured by the propaganda of Dr. Marie Stopes and her husband, Dr. H. V. Roe, who established in March, 1921, The Mothers' Clinic. Two additional clinics in London were opened the following year. The Fifth International Birth Control Congress was held at London July 11-14, 1922.

In France during the war the censorship greatly interfered with birth control publications and such efforts as revived in 1919 were terminated by an act of July, 1920, which drastically and comprehensively prohibited every sort of propagation of knowledge of contraconception and abortion. The publication, transportation, and sale of literature is prohibited and public lectures forbidden. Violations, moreover, are to be tried by the judges of the Tribunal Correo-

tionnel instead of the juries of the Cours d'Assises. This not only means secret proceedings and hence no propaganda value in the trials but places the guilty at the mercy of the judges. This legislation was undoubtedly a reaction of publicists, employers and militarists to the after-war desire for population increase to insure national safety and prestige. It had the support of numerous economists and demographers and of various organizations, such as, *L'Alliance nationale pour l'accroissement de la population française*.

In Vienna, Austria, a clinic was opened in November, 1923 by Johann Ferch, with the support of the League Against Forced Motherhood. This began agitation for repeal of the law prohibiting abortion. Dr. Ferch says, *Birth Control Review*, July, 1924: "We propose that poor and sick women in the first three months of pregnancy shall have the right, for social and health reasons, to interrupt the pregnancy." The proposed law was defeated in December, 1923 by the combined opposition of clericals and national militarists. An international congress on contraceptive devices was held at Amsterdam, Holland, Aug. 29-30, 1921. Representatives were present from the United States, England, France, Germany and Holland.

Japan, China and India all show increasing consciousness of overpopulation. Unchecked births and decreasing death rates compel a discussion of Neo-Malthusianism. In spite of official opposition a birth-control group was formed at Tokyo in 1921 with Baroness Ishimoto as head. In 1922 official objection to Mrs. Sanger's visit was withdrawn on the understanding she would hold no public meetings. Nevertheless, the Japan Birth Control League began issue of a magazine in May, 1922. The first supporting organization in China was formed by the women of the National University in 1922. About the same time organized propaganda began in India. See ABORTION.

Cooper, *Birth Control*, a most effective presentation of the Catholic viewpoint, National Catholic Welfare Conference, Washington, D. C.

BIRTH CONTROL LEAGUE, AMERICAN. A Society organized Nov. 2, 1921 and incorporated under the laws of New York State, Apr. 5, 1922. The purposes of the society were stated as follows: To enlighten and educate all sections of the American public in the various aspects of the dangers of uncontrolled procrea-

tion and the imperative necessity of a world programme of birth control; to correlate the findings of scientists, statisticians, investigators, and social agencies in all fields; to organize and conduct clinics where the medical profession may give to mothers and potential mothers harmless, reliable methods of birth control; to enlist the support and coöperation of legal advisors, statesmen and legislators in effecting the removal of State and Federal statutes which encourage dysgenic breeding. The League is in close relation with European organizations carrying on the same work. In 1924 there were 27,500 members. It published leaflets, pamphlets and books, and the monthly *Birth Control Review*. Besides the headquarters in New York the League maintained 10 branches in Pennsylvania, Ohio, Indiana, Michigan, Massachusetts, Connecticut, Colorado, and British Columbia. President, Mrs. Margaret Sanger; vice-presidents, Mrs. Lewis L. Delafield, and Mrs. Juliet Barrett Rublee; Treasurer, Mrs. Frances B. Ackerman; Executive Secretary, Mrs. Anne Kennedy. Headquarters, 104 Fifth Avenue, New York City.

BIRTH REGISTRATION. See CHILD WELFARE, VITAL STATISTICS.

BISCHOFF, DIETRICH (1866-). A German author born at Bremen, formerly known under the pseudonym "Adam Ego." He has written prolifically on social ethics, masonry, insurance laws, and kindred subjects, and at the same time held the presidency of the leading insurance company of Leipzig. His works include *Ine Soziale Frage und Ihre Losung* (1896), *Echte und Falsche Gerechtigkeit* (1899), *Der Soziale Grundgedanke der Freimaurerlehre* (1900), *Der Individualismus in der Freimaurerei* (1901), *Maurerium und Menschheitstum* (1902), *Wesen und Ziele der Freimaurerei* (1912), *Freimaurerische Kriegsgedanken* (1914), *Vom Zukunftsberuf der Deutschen Freimaurer* (1915), *Religion und Freimaurerei* (1916), *Die Sozialisierung Unseres Wirtschaftslebens* (1918), *Sozialismus und Religion* (1919), *Die Sozialisierung der Geister* (1919), *Freimaurerei und Deutschtum* (1920), and *Vom Vaterlandischen Beruf der Deutschen Freimaurer* (1919).

BISHOP, FREDERIC LENDALL (1874-). An American physicist, born at St. Johnsbury, Vt., and educated at the Massachusetts Institute of Technology and the University of Chicago. In 1898 he became head of the department of physics in the Bradley Polytechnic Institute and remained there until 1909, when he was called to the chair of physics in the University of Pittsburgh, and also became dean of its engineering college. His original investigations include studies on thermal conductivity and variations of wave length with pressure, surface tension, high temperature, and viscosity, on all of which he has published papers. Besides editing *Engineering Education*, he has served as secretary of the Society for the Promotion of Engineering Education and is a member of many scientific societies.

BISHOP, JOSEPH BUCKLIN (1847-). An American journalist and government official (see Vol. III). He is author of *A Chronicle of 150 Years* (1918), *Theodore Roosevelt and His Times*, and *Charles Joseph Bonaparte: His Life and Public Services* (1922). *Shown in His Letters*, 2 vols. (1920), and edited *Theodore Roosevelt's Letters to His Children* (1919).

BISHOP, LOUIS FAUGÈRES (1864-). An American physician born in New Brunswick, N. J., and educated at Rutgers College and Columbia University. He is professor of diseases of the heart and circulation in Fordham University Medical School and physician to Lincoln Hospital. He made many contributions to periodical literature on diseases of the heart and blood vessels and blood pressure, etc. His works include *Heart Disease, Blood Pressure, etc.*, (1909), translated into French the following year; *Arteriosclerosis* (1914), translated into French by Francon in 1921; and *Heart Troubles: Their Prevention and Relief* (1920).

BISSING, FERDINAND, BARON VON. See BELGUM, *History*.

BISSOLATI-BERGAMASCHI, LEONIDA (1857-1920). An Italian Socialist politician and statesman, born at Cremona, the son of Demetrio Bergamaschi, and adopted son of the philosopher, Professor Bissolati. Using as tools his weekly editions, *La Critica sociale* and *La Lotta di Classe*, and the daily Socialist organ, *L'Avanti*, he became widely known as the leader of the Socialist element in Italy which remained faithful to the government during the War. He was elected to the Chamber from Pescarolo in 1897, later from Budrio, and in 1908, from the second division of Rome, which he represented until his death. Because he could not sympathize with the Socialists in their anti-patriotic sentiments, particularly in the Libyan War, Bissolati formed with Bonomi and other Socialist leaders what was called the Reformed Socialist group. On the outbreak of the War he enlisted as a sergeant of the Alpini, was wounded, and was decorated for his valour. In June, 1916, after the fall of the Salandra government, he was appointed to the cabinet and served under Premier Bosselli as well as in the succeeding ministry of Orlando. At the Armistice he resigned because of a disagreement over the Pact of London. Although he advocated the annexation of Fiume, he lost popular support because of his opposition to the annexation of Alto Adige and North Dalmatia. When he expressed these views in his speech at Milan on the League of Nations, he was severely criticized. He died at Rome on May 6, 1920. He had not been popular in the last years of his life but was greatly mourned at his death.

BITTERAU, THEODOR (1877-). A German historian, born at Nuremberg. He was professor at the universities of Erlangen and Munich, lecturer on history at the military academy of Munich, and writer of *Die Kurbairischen Polen im Siebenjährigen Kriege* (1901), *Geschichte des Rheinbundes* (1905), *Die Traditionen des Hochstiftes Freising* (1905-9), *Bayern als Königreich* (1906), *Die Deutschen Polen und die Entstehung des Krieges* (1915), *Napoleon I* (1916), *Friedrich der Grosse* (1916), *Geschichte der Französischen Revolution* (1921), and other historical works.

BJORKMAN, EDWIN AUGUST (1866-). An American author, born at Stockholm, Sweden, where he was educated in the South-End Higher Latin School. When he was 25 years old he came to America and edited the *Minnesota Posten* at St. Paul (1892-94). His later work

in journalism took him as a reporter, music critic, and editor to *The Times*, Minneapolis (1894-97), the *New York Sun* and *New York Times* (1897-1905), and the *New York Evening Post* (1906). Subsequently he was a departmental editor of *The World's Work* and editor of the *Modern Drama Series* (1912-15). In 1915-17, he represented the British Department of Information in Sweden and directed the Scandinavian bureau of the Committee on Public Information (1918-19). Mr. Bjorkman became associate director of the League of Nations News Bureau in 1920. He wrote *Is There Anything New Under the Sun?* (1911); *Gleams—A Fragmentary Interpretation of Man and His World* (1912); *Voices of To-morrow* (1913); *Scandinavia and the War* (1914); *The Cry of the Ukraine* (1915), and *The Soul of a Child* (1922). In addition he translated plays of Björnson, Bergstrom, Schnitzler, and others.

BJORNSTAD, ALFRED WILLIAM (1874-). An American army officer, born in St. Paul, Minn., educated at the University of Minnesota, which he left in 1896 to enter the army at the outbreak of the Spanish-American War. He was commissioned first lieutenant in the 13th Minnesota Infantry in 1898. In 1899 he was appointed Captain of Volunteers in the United States Infantry and in 1901 became first lieutenant in the Regular Army. He was promoted to the rank of major in 1917, to lieutenant-colonel in the National Army in the same year, and in 1918 rose to brigadier-general. From 1898 to 1904 he served in the Philippines. He was on duty with the General Staff in 1911-12 and served in various capacities with that body until 1917. He organized and directed, in that year, 16 training camps for training officers for the War. He served as Chief of Staff for the 30th Division in 1917 and organized and directed the Army General Staff College in France, 1917-18. He was Chief of Staff for the 3d Army Corps in 1918 and was commander of the 13th Brigade in 1918-19. In this capacity he took part in all the major engagements in France. After the War he resumed duty at the General Staff College and in 1920 was appointed commander at Fort Snelling, Minn. He received the Distinguished Service Cross and the Distinguished Service Medal and was decorated by the British and French governments.

BLACK, HENRY CAMPBELL (1860-). An American law author and editor, born at Ossining, N. Y., and educated at Trinity College. After studying law, he was admitted to the bar in 1883. He practiced for several years at Williamsport, Pa., and St. Paul, Minn. In 1888 he removed to Washington, where he devoted himself to legal literature. He was editor of the *Constitutional Review* and in 1917 lectured on constitutional government at Trinity College. Among his published books are *Constitutional Prohibitions* (1887); *Dictionary of Law* (1891-1910); *American Constitutional Law* (1895, 1897, 1919); *Income and Other Federal Taxes* (1917 and 1919); and *Relation of Executive Power to Legislation* (1919). He contributed frequently to legal periodicals and encyclopedias.

BLACK, HUGH (1868-). An English theologian (see VOL. III). He is the author of *The Open Door* (1914), *The New World* (1915), and *Lest We Forget* (1920).

BLACK, WILLIAM MURRAY (1855-). An American army officer (see VOL. III). In 1917

he was chairman of the Inland Transportation Committee of the Council of National Defense. He was a member of the United States Shipping Board in 1919 and retired from active service in the latter year. He was awarded the Distinguished Service Medal in 1918 for planning and administering the engineering and military railway service during the War. In collaboration with Prof. E. B. Phelps he invented a method of purifying sewage by aération.

BLACK WART DISEASE OF POTATOES. See PLANTS, DISEASES OF.

BLACKWELDER, ELIOT (1880-). An American geologist, born at Chicago, Ill., and educated at the University of Chicago. In 1902 he was given a fellowship at Chicago, where he also became an instructor in geology, but in 1905 he transferred his allegiance to Wisconsin, where he remained until 1916, attaining full professorial rank in 1910. He was professor of geology and head of the department in the University of Illinois, 1916-19, and in 1919 was visiting professor of geology at Leland Stanford Junior University, where in 1922 he became a full professor. From 1906 to 1918 he was also connected with the United States Geological Survey at first as field assistant in Montana and Wyoming but after 1909 as a geologist studying problems in northern Utah, southeastern Idaho, western Wyoming, and then Alaska, especially the glacial and stratigraphic features and economic resources of these regions. He was a member of the California Petroleum Commission in 1917 and of geological expeditions to China and other foreign countries.

BLACKWELL, ALICE STONE (1857-). An American journalist (see VOL. III). She was editor-in-chief of the *Woman's Journal* (Boston) until 1917, when the *Woman's Journal*, the *Woman Voter*, and the *Headquarters News-Letter* were consolidated as the *Woman Citizen*. She became contributing editor to the latter. She is the author of *The Little Grandmother of the Russian Revolution: Catherine Breshkovsky's Own Story* (1917).

BLAKE, EDGAR (1869-). An American bishop, born at Gorham, Me., and educated in the common schools and in the Boston University School of Theology. During 1895-1908 he was pastor in Methodist churches of Salem, Lebanon and Manchester, N. H. He was elected bishop in 1920.

BLAKE, JOSEPH AUGUSTUS (1864-). An American surgeon, born in San Francisco, and educated at Yale and Columbia Universities. At the outbreak of the War he had charge of the surgical ambulance at Neuilly, France, and in 1917 became head of the American Red Cross Military Hospital. In 1917 he was given the Cross of the Legion of Honor. He has written much on surgical subjects and in 1918 published his *Gunshot Fractures of the Extremities*.

BLAKELOCK, RALPH ALBERT (1847-1919). An American landscape painter, one of the foremost of the school (see VOL. III). During his long confinement in the State hospital for the insane at Bennington, N. Y., his great paintings, from which he had been unable to eke a livelihood, brought record prices; "Moonlight," for example, was sold to the Toledo Art Museum for \$20,000. In 1916 he was released from the hospital as sane and endeavored to resume his work as a painter, but without success. He was taken back to the institution in 1918 and

died at the camp of a friend in the Adirondacks in 1919.

BLAKESLEE, GEORGE HUBBARD (1871-). An American professor (see VOL. III). He is the editor of *Recent Developments in China, Latin America; Problems and Lessons of the War; Mexico and the Caribbean*; and the *Journal of International Relations*. He organized the Clark University Conference on International Relations and in 1917-18 prepared reports on German colonies in the Pacific for the American Commission to Negotiate Peace. He was technical advisor to the American delegation at the Disarmament Conference in Washington, 1921.

BLAKEY, ROY GILLISPIE (1880-). An American economist, born at Shelbina, Mo., and educated at Drake, Missouri, Colorado and Columbia Universities. He began as a newspaper reporter, and later became a university instructor and member of various economic commissions. In 1919 he was made professor of economics of the University of Minnesota. Among his works are *The United States Beet Sugar Industry and the Tariff* (1912) and the brochure, *The Comparative Costs of State Governments* (1916).

BLANCHARD, ARTHUR HORACE (1877-). An American civil engineer, born at Providence, R. I., and educated at Brown and Columbia Universities. He began teaching in 1899 as an instructor in civil engineering and mathematics at Brown, where he remained until 1911, when he returned to Columbia as professor of highway engineering, a chair which he relinquished in 1917 and in 1919 went to the University of Michigan, where he became professor of highway engineering and highway transport. Meanwhile he was consultant to various official organizations. During the War he was a member of the Council of Defense and served as vice-chairman of the National Highway Commission. Besides being associated in the authorship of *Highways* (1910-12) and *Highway Engineering* (1913), he was editor-in-chief of the *American Highway Engineer's Pocketbook* (1919) and the *American Highway Transportation Handbook* (1920).

BLAND, EDITH NESBIT (MRS. HUBERT) (1858-1924). An English poet and novelist (see VOL. III). She is the author of *Garden Poems* (1914), *Five Children and It* (1921), *The Incredible Honeymoon* (1921), *The Story of the Amulet* (1921), *The Enchanted Castle* (1922), *The Lark* (1922), and *Many Voices: Poems* (1922). New editions of many of her earlier books have appeared.

BLAND-SUTTON, SIR JOHN (1855-). An eminent British surgeon, born at Enfield Highway. His writings, concerned chiefly with pathology and gynæcological surgery, include *Introduction to General Pathology* (1886); *Ligaments, Their Nature and Morphology* (1887); *Evolution and Disease* (1890); *Surgical Diseases of the Ovaries and Fallopian Tubes* (1891), and *Tumors, Innocent and Malignant* (1893). The volume on tumors, his masterpiece, went through its seventh edition in 1922. He has also written *Gallstones and Diseases of the Bile-ducts* (1907); *Fibroids of the Uterus* (1913), and *Selected Lectures and Essays* (1920). In collaboration with Giles he wrote a textbook on *Diseases of Women* (1897), which has also seen its seventh edition.

BLASCHKE, PAUL (1850-). A German

lexicographer, born at Wigandstal, and educated at the University of Leipzig. After employment in the postal service, he spent several years as a tutor and finally became a lexicographer. During the period 1878-1916, he published innumerable books on French, Italian, Portuguese, and Spanish grammar, German-English-French guides to conversations, a German-English-French and French-English-German electrotechnical dictionary (1913), a Polish grammar (1916), and a German-English-French medical dictionary (1916).

BLASCO IBÁÑEZ, VICENTE (1867-). A Spanish novelist, journalist, and politician. In his youth he occupied a prominent place in the political and literary controversies of the day and often found himself in difficulties with the authorities. His first novel, *La Barraca*, appears in 1899; thereafter he wrote voluminously. He was introduced to the English-speaking world with his *Four Horsemen of the Apocalypse* (1918), which achieved an extraordinary popularity. Other works done into English were *Our Sea* (1920); *Torrent* (1923); and *The Temptress* (1923). For a time, Ibáñez ranked in the forefront of contemporary Spanish novelists, but his reputation declined as familiarity with other modern Spanish writers, Pio Baroja, for instance, grew. It was seen that while he had mastered narrative art, his work showed scarcely any contact with reality. During the period he continued to attract American attention by his sensational newspaper articles on Mexico, Europe, etc.

BLATCH, HARRIOT STANTON (1856-). An American lecturer and writer on feminism (see Vol. III). In 1917 she became head of the speakers' bureau of the Food Administration. She is the author of *Mobilizing Woman Power* (1918), *A Woman's Point of View* (1919), and *Elizabeth Cady Stanton as Revealed in Her Reminiscences, Letters and Diary* (1921).

BLEI, FRANZ (1871-). An Austrian writer, born at Vienna, and educated in political economy at the universities of Vienna, Paris, Berne, and Zurich. After traveling in France, Italy, and America, he entered the literary field as playwright, but soon devoted himself to the essay. His principal works include *Oscar Wilde* (1904), *Novalis* (1904), *Von Amoreusen Frauen* (1906), *Felicien Rops* (1906), *Die Romantische Renaissance* (1906), *Landfahrer und Abenteurer* (1913), *Die Puderquaste* (1913), *Menschliche Betrachtungen zur Politik* (1915), *Summa* (1918), and *Retrung* (1920). He has also translated numerous works of French authors, among them Marcel Schwob's *Monelle*, André Gide's *Le Roi Candale*, Maurice Barrès's *Du Sang de la Volupté et de la Mort*, and others of Paul Claudel, Walt Whitman, and Oscar Wilde. He has also edited the works of Goethe, Reinhold Lenz, and others.

BLEIBTREU, CARL (1859-). A German author and historian, born in Berlin. (See Vol. III). He is said to have inaugurated the modern movement in German literature by his essay, *Die Revolution der Litteratur* (1885). His contributions to war literature are *Englands Waterloozüge* (1915) and *Stegemanns Weltkrieg und die Marneschlacht* (1916).

BLEININGER, ALBERT VICTOR (1873-). A German-American chemist, born at Polling, in Bavaria, and educated at Ohio State University, where he became instructor in ceramics, attaining an associate professorship in 1906.

In 1907 he went to the University of Illinois and three years later was made full professor and director of the department of ceramics. During 1908-10 he was in charge of the clay products section of the United States Geological Survey and in 1912-20 of a similar division of the Bureau of Standards, becoming in 1920, chemist to the Homer Laughlin China Company. He has lectured on his specialty at the University of Chicago (1912) and at the Franklin Institute (1917) and was chairman of the committee on ceramic industry of the National Research Council. Professor Bleininger is a member of various technical societies including the American Ceramic Society, of which he was president in 1918. Besides editing various journals he has published the *Collected Works of H. A. Seger* (1903) and is the author of *The Manufacture of Hydraulic Cement* (1904).

BLEULER, PAUL EUGEN (1857-). A Swiss psychiatrist, known especially for his original conceptions of psychology and insanity. He has divided all mankind into schizoids and syntonics and has renamed dementia præcox by calling it schizophrenia; that is, the highest pathological expression of the schizoid mind. Bleuler was born at Zollikon, received his medical degree from the University of Berne, and was appointed professor of psychiatry in the University of Zürich. He wrote *Dementia Præcox oder Schizophrenia* (1911), translated into English by William A. White (1912); *Das Autistisch-undisziplinierte Denken in der Medizin* (1919), and *Lehrbuch der Psychiatrie* (1920), translated into English by A. A. Brill (1924). He was editor of the *Jahrbuch für Psychoanalytische und Psychopathische Forschungen* during 1909-13. He was the first of Freud's contemporaries to speak favorably of psychoanalysis; however, he has never been classed as a militant member of this movement.

BLICHFELDT, HANS FREDERIK (1873-). Mathematician, born in Denmark. He came to the United States in 1888, and after settling in Washington he became in 1892 a draftsman in the engineering department of the city and county of New Whatcom. Two years later he entered Leland Stanford Junior University. He studied also at the University of Leipzig. He then returned to Stanford as instructor in mathematics, and after passing through the lower grades he was made professor of that subject in 1913. Dr Blichfeldt has made original studies of various subjects on continuous groups, linear homogeneous substitution groups, and the geometry of numbers, and has contributed papers on the results to the *American Journal of Mathematics* and especially to the transactions and bulletins of the American Mathematical Society, of which he was a vice-president in 1912. His published papers are about 30 in number and include *Finite Groups of Linear Homogeneous Transformations*, published as Part Two of the *Theory and Application of Finite Group* (1916).

BLINN, HOLBROOK (1892-). An American actor, born in San Francisco. He appeared on the legitimate stage as a child, played throughout the United States and in London, and did some good work for the moving pictures. His successes include *Molière* (1919), *A Woman of No Importance* (1916), *The Lady of the Camelias* (1917), *Getting Together* (1918), and *The Bad Man* (1920-23). In the

last he had perhaps his best stage part. In 1923-1924 he worked in moving pictures.

BLISS, GILBERT AMES (1876-). An American mathematician, born at Chicago, where he was educated at the university. As an instructor in mathematics he taught at the University of Minnesota. He went to Göttingen for a year in 1902 and then returned to Chicago as an associate. In 1904 he was called to the University of Missouri, and from there to Princeton, where he remained three years. Returning to Chicago in 1908 as associate professor, he continued in this capacity until 1913, when he attained full professorial rank. He has given special lectures in mathematics at Princeton in 1909 and at Harvard in 1911. The former were published as *The Princeton Colloquium Lectures, Part One. Fundamental Existence Theorems* (1913). During the War he served as a scientific expert on range firing sections in the United States Army. He has made special studies of differential equations, calculus of variations, and theory of functions of lines with an application to ballistics, on all of which he has contributed valuable papers to the *American Journal of Mathematics* and to the transactions and bulletins of the American Mathematical Society. Dr. Bliss was associate editor of the *Annals of Mathematics* in 1906-08 and of the transactions of the American Mathematical Society in 1908-16.

BLISS, TASKER HOWARD (1853-). An American soldier, born at Lewisburg, Pa., and for two years a student at the university of that city, now Bucknell University. He graduated from the United States Military Academy in 1875, was professor of military science at the Naval War College from 1885 to 1888, and spent two years as military attaché at Madrid. At the close of the Spanish-American War in which he had served during the Porto Rican campaign of 1898, he was appointed collector of customs at the port of Havana and in 1902 was made special envoy to Cuba, to negotiate the treaty of reciprocity between Cuba and the United States. He was commandant of the Army War College in 1903. From 1905 to 1909 he held commands in the Philippines. In the early part of 1911 he commanded the provisional brigade on the southern California border during the Mexican insurrection, after which he was for a short time commander of the Western Department. He was placed in command of the Department of the East on Aug. 12, 1911, and became chief of staff of the United States army, with the rank of general, on Oct. 6, 1917. Although he reached the legal age of retirement on December 31 of that year, he remained on active duty by order of President Wilson and was appointed to membership on the Supreme War Council in France. He was also a member of the American Commission to Negotiate Peace in Paris, 1918-19. On May 1, 1920, he was detailed by the President as governor of the United States Soldiers' Home. He received the United States Distinguished Service Medal.

BLOCH, ERNEST (1880-). A distinguished Swiss composer, born at Geneva. He received his musical education at the Conservatoire in Brussels and later at Hoch's Conservatory in Frankfurt. In 1909-10 he was conductor of the subscription concerts in Lausanne, and from 1911 to 1915 professor of composition at the Geneva Conservatory. In 1916 he came to New York, where he taught composition at

the David Mannes School of Music. In 1920 he became director of the Cleveland Institute of Music. His music is rather harsh and austere; he draws his inspiration mainly from Jewish subjects and consciously attempts to give expression to the aspirations and ideals of the Jewish race. His works include an opera, *Macbeth* (Paris, 1910); three symphonies, in C sharp minor, in F (*Israel*), and *Symphonie Orientale*, on Hebrew themes; two symphonic poems, *Hiver-Printemps* and *Vivre et Aimer*; *Trois Poèmes Juifs* for orchestra; *Poèmes d'Automne* for soprano and orchestra; *Schelomo* for 'cello and orchestra; Psalms 22, 114, and 137, for solo voices and orchestra; a string quartet in B; a violin sonata; and a viola sonata which won the Coolidge Prize at the Berkshire Chamber Music Festival, 1919. A second opera, *Jezabel*, was still unfinished in 1924.

BLOCH, JEAN-RICHARD (1884-). A French editor and author, born in Paris. In 1910 he founded the review *L'Effort*, which was later enlarged and entitled *L'Effort Libre*. He wrote essays, short stories and novels. His best known works are *Carnaval Est Mort*, a collection of articles whose general tenor is that there is no more art because there is no more faith; *Lévy, Premier Livre de Contes* (1912); and *Et Cie.*, a novel (1918). The two last works are stories constituting a sympathetic analysis of the Jewish character.

BLOCK, ALEXANDER A. (1880-1921). A Russian poet and playwright, born in Petrograd. He was one of the leaders of the Modernist school in Russia. His poetry shows two distinct phases of development; during the earlier period he seemed to live in a mystic land of unreality and dreams; later, he became vigorous, patriotic, hopeful. *Songs of the Beautiful Lady* (1905) belongs to the earlier phase, *Poems on Russia* (1915) to the later. His poetry is impressionistic, and he employs the so-called new rhythm, similar to that of German and English. Besides the works mentioned he is author of *The Unexpected Joy* (1907), *Snow-Mask* (1907), *Snow-Bound* (1908) *Night Watches* (1911), and *The Twelve*. The last is his masterpiece, giving a powerful picture of Petrograd at the beginning of the Bolshevik Revolution. Block, although not a Communist, was acclaimed by the Bolsheviks after the publication of *The Twelve*. He died from illness due to undernourishment under the Bolshevik régime, on Aug. 11, 1921.

BLOCK, PAUL (1862-). A German editor and author, born at Memel. He studied at Memel and Königsberg and specialized in history and literature. In 1899 he became connected with the *Berliner Tageblatt*, and has been its Paris correspondent (1906-11), war correspondent, and literary editor. His works are the novels, *Der Graumonch* (1885), *Am Leuchtturm* (1886), *Anno Sturm* (1887), *Die Diamanten der Königin* (1888); the plays, *Der Racher* (1888), *Rübezahl* (1888), *Rolands Knappen* (1888), *In der Tiefe* (1889), *Bergmanns Glück* (1889), *Gift* (1890); a volume of Parisian sketches (1911); *Der Verwandelte Bürger* (1919), dealing with the outbreak of the revolution in Germany; and numerous translations.

BLOCKADE, ALLIED. The measures taken by Great Britain, with the approval of the other Allies, and to some extent assisted by them, to prevent goods from reaching Germany which could assist the latter in prosecuting the War,

did not constitute normal blockade of the German Coast in the earlier sense of the word. At first, it was less than a blockade as heretofore understood; by 1916 it had become the most drastic and effective control of neutral commerce ever attempted by belligerents. Submarine mines and submarine boats had made a close blockade of the old type absolutely impracticable. The blockade lines of cruisers were drawn across the English Channel in the south and between the north of Scotland and the Norwegian Coast. At the outbreak of war, the Allies announced that they would follow the rules of the Declaration of London, of which Great Britain and the United States were not signatories, with some modifications. No notice of formal blockade was given then or later, but lists of articles declared to be contraband were published; these lists were subsequently extended. The results of these measures were very unsatisfactory. In an intensive war, where the whole population is concerned in efforts to maintain the greatest field force possible, the receipt of almost any kind of goods from abroad will release some of the people to military service or to some industry which is engaged in supplying the fighting line. Nearly all goods thus become contraband in the sense that they assist the enemy in the prosecution of the war. Moreover, enemy goods sent to neutral countries furnished means for the purchase of goods for import in return.

In the cases of neutral countries whose land frontiers bordered Germany, interruption of traffic in goods originating in the neutral country or brought by land from some other neutral country was neither legal nor practicable. But in the case of goods imported by neutrals from overseas, the conditions were different. The doctrine of "continuous voyage" was amplified and extended. All such goods in excess of local neutral requirements were seized and condemned for purchase by the Allies or for confiscation. The restrictions imposed on this trade, especially in regard to insurance, censorship, cables, and the supply of coal and oil, forced the formation of mercantile associations in the neutral countries outside the Baltic, and these guaranteed the purely neutral destination of cargoes. When the United States entered the War, the source of supply of goods which could be passed on to the enemy via neutral territory was reduced to comparative unimportance, as control could be exercised at the place of export. The suppression of oversea trade designed to furnish supplies to Germany was then complete and was largely instrumental in forcing the enemy to sue for peace.

BLOMFIELD, SIR REGINALD (1856—). An English architect, born at Aldington, Kent, and educated at Haileybury, Oxford University, and Exeter College. After spending three years in an architectural office and studying at the Royal Academy School of Architecture, he traveled on the Continent for a year and then started practicing in London in 1884. His style is late English Renaissance. Besides country houses he designed many public buildings in London and elsewhere including the Goldsmiths' College, New Cross; the Imperial War Cross, Chelsea, and the new buildings for Lady Margaret Hall, Oxford. He also designed part of the façade of the Quadrant in Regent Street, London. At the outbreak of the War he obtained a commission in charge of trench work and was afterward chosen principal architect

of the Imperial War Graves Commission. He was made Associate of the Royal Academy in 1905 and served as professor of architecture there from 1906 to 1910. He was awarded the gold medal of the Royal Institute of British Architects in 1913 and in the following year was elected president of that body. Well-known as an art historian and critic, he was made Officer de l'Instruction Publique by the French government. His works include *The Formal Garden in England*, with F. I. Thomas (1892), *History of Renaissance Architecture in England* (1897), *The Mistress Art* (1908), and *French Architecture*, successive volumes (1911 and 1921). He was knighted in 1919.

BLONDIN, PIERRE EDOUARD (1874—). A Postmaster General of Canada, born at Saint Francois du Lac, Yamaska, and educated at the Séminaire de Nicolet, St. Michel's College, Toronto, and Laval University, Montreal. In 1908 and 1911 he was elected to the House of Commons for Champlain and in the latter year was Deputy Speaker at the first session of the 12th Parliament. He was sworn of the Privy Council and appointed Minister of Inland Revenue in 1914. Blondin enlisted in 1917 and was given command of the 158th Battalion of the Canadian Expeditionary Forces; he went abroad in October of that year as Commander of the Legion of Honor. He was a Conservative member of Parliament for the county of Champlain in 1917 and in the following year was called to the Senate.

BLOOD PRESSURE. Since about 1914 many diagnosticians have formed the opinion that the ordinary measurement, the systolic, is insufficient to give a correct idea of the true state of the blood pressure. They have therefore advocated that the diastolic and differential pressures be given more weight, the differential or pulse pressure being the true index of the circulation. While this attitude is sound in theory, it is so difficult to obtain satisfactory readings of the pulse pressure that some practical men have returned to dependence on the systolic pressure alone. The practical value of the systolic pressure is still held to be great, but this value is restricted to a very few diseases. In regard to the prevention and relief of high blood pressure, certain factors commonly accused have never been proved to cause or maintain this condition. Remarkable reduction of pressure has sometimes been obtained by the use of certain diets, as the so-called basic or alkaline diet, and also by the use of alkalies themselves.

BLOOMFIELD, MAURICE (1855—). An American orientalist. He was born in Austria but came to America as a youth and studied at the University of Chicago and Johns Hopkins, as well as at Berlin and Leipzig. He has been professor of Sanskrit and comparative philology since 1885. His early works dealt with the Vedas, their religion, mythology and poetry. Recent publications of his are *Life and Stories of the Jarna Savior Paravanatha* (1916) and a work on the *Rig Veda* (1916).

BLOS, ANNA (1866—). A German social worker and teacher, born at Liegnitz. She has written on feminism and various social problems. Among her works are *Krieg und Schule* (1915) and *Frauenarbeit im Kriege* (1917). She is the wife of Wilhelm Blos, the author.

BLUE, RUPERT (1867—). An American sanitarian and public official (see Vol. III). In

1915 he was elected president of the American Medical Association and of the Association of Military Surgeons. In 1920-21 he was United States delegate to the International Office of Public Hygiene at Paris, and to the third Decennial Revision of International Nomenclature of Diseases.

BLUE, VICTOR (1865-). An American naval officer (see Vol. III). He commanded the battleship *Texas* in the North Sea under Admiral Beatty in 1917 and 1918. On Dec 16, 1918, he was reappointed chief of the Bureau of Navigation and was made rear-admiral on Apr. 1, 1919. He was awarded the Distinguished Service Medal for service in the North Sea. He was retired in June, 1919, because of disability received in line of duty.

BLUNT, WILFRID SCAWEN (1840-1922). An English author (see Vol. III). In 1914 he published his complete poetical works. He also published *My Diaries*, in two parts (1919 and 1920).

BLYTHER, SAMUEL GEORGE (1868-). An American writer born at Geneseo, N. Y., where he was educated at the State Normal School. In the period 1893-99, he did editorial work for the *Buffalo Express*, the *Buffalo Courier* and *Enquirer*, and the *Cosmopolitan Magazine*. For the next seven years he was Washington correspondent for the *New York World*. He became a staff writer of the *Saturday Evening Post* (Philadelphia) in 1907. Among his publications are *We Have With us To-night* (1909); *Cutting It Out* (1912); *The Old Game* (1914); *The Fakers* (1915); *Hunkins* (1919) and *The Manikin Makers* (1921).

BOAS, ISMAR (ISIDOR) (1858-). A German physician and pioneer gastroenterologist, born at Exin in Posen, and educated at Halle. In 1886 he established at Berlin the first service for diseases of the stomach and intestines. In 1907 he became professor of gastroenterology in the University of Berlin, began to write on gastroenterological subjects in 1886 and republished his minor articles in 1906 under the title *Gesammelte Beiträge*. His book, *Diagnostik und Therapie der Magenkrankheiten*, published 1890-93, was often republished, and an American translation was made by A. Bernheim in 1907. His companion book, *Diagnostik und Therapie der Darmkrankheiten*, first published in 1898, was followed in 1901 by an American translation by Seymour Basch. Other well known works of his are *Die Lehre von der Okkulten Blutungen* (1914), *Diatetik der Magen- und Darmkrankheiten* (1920), and *Das Hemorrhoidalleiden* (1922). A monograph, *Habitual Constipation*, appeared in 1923 in a translation by Dr. T. L. Stedman.

BOCKENHEIMER, PHILIPP (1875-). German surgeon, born at Frankfurt-am-Main. In 1907 he was made professor of surgery in the University of Berlin. In 1904-06, in collaboration with Frohse, he published the *Atlas Typischer Chirurgischen Operationen* put into English by J. Howell Evans. The *Atlas Chirurgischer Krankheitsbilder* was issued by Bockenheimer alone in 1907 and translated into English by C. F. Marshall in 1908. Other works are the *Leitfaden der Frakturen-Behandlung* (1909); *Plastische Operationen* (1912), and *Die Neue Chirurgie*, (1921).

BODANZKY, ARTUR (1877-). An Austrian conductor, born at Vienna. After gradua-

tion from the Vienna Konservatorium he began his career in 1897 as violinist at the Hofoper and studied composition with A. von Zemlinsky. His first position as conductor was at the Stadttheater at Budweis, where he conducted only operettas. In 1901 he went to the Karltheater in Vienna, and two years later became Mahler's assistant at the Hofoper. He then conducted one season at the Theater an der Wien (1904) and at the Lortzing Theater in Berlin (1905). In 1906-09 he was conductor at the Deutsches Landestheater in Prague and also conducted symphony concerts. There his excellent work soon attracted attention, and in 1909 he was called to Mannheim as director and first conductor of the Grandducal Theater and conductor of the symphony and oratorio concerts. In 1914 he conducted the first performances of *Parsifal* at Covent Garden, where Gatti-Casazza was so impressed with his ability that he secured him as Hertz's successor at the Metropolitan Opera House in New York. This position he has filled with distinction since he began his American career with a masterly performance of *Götterdämmerung* (Nov. 17, 1915). Since 1916 he has also been conductor for the Society of the Friends of Music, and from 1919 to 1921 he led the concerts of the National Symphony Orchestra with conspicuous success. After the amalgamation of the latter organization with the Philharmonic Society (1921), he directed several Philharmonic concerts as guest-conductor. He is a conductor of the Mahler type, authoritative, electrifying, and forceful. He revised the scores of Weber's *Oberon* and *Freschutz*, setting all the spoken dialogues to music. Both works were brought out at the Metropolitan Opera House under his direction, the former on Dec. 28, 1918, the latter on Mar. 22, 1924. He has made an excellent German translation of the libretto of Mozart's *Don Giovanni* (1911).

BÖDEWADT, JACOB A. C. (1883-). German author born in Tondern (formerly Schleswig, now Denmark). He has specialized on political and literary subjects concerned with the Low Germans and is the author of *Johannes Dose, der Erfolgreiche* (1905), *Gustav Frenssen* (1906), *J. H. Fehrs* (1913), *Weltkrieg und Niederdeutschum* (1915), *Timm Kröger* (1916) and some one-act plays in Plattdeutsch dialect. He edited *Holstenart* (1914), *J. H. Fehrs's Gesammelte Dichtungen* (1913), *Klaus Groth's Briefe über Hoch- und Niederdeutsch* (1914), *Timm Kröger's Gedenkbuch* (1920) and *Zwischen zwei Meeren* (1921), and an anthology, *Dichter der Nordmark* (1921).

BODLEY, JOHN EDWARD COURTENAY (1853-1925). An English author (see Vol. III). He has written *An Introduction to the English Edition of the National History of France* (1916) and *The Romance of the Battle-line in France* (1918).

BOEHN, MAX VON (1860-). A German writer, born in Potsdam. He concerns himself with customs, fashions, and art. He is the author of *Spanische Reisebilder* (1905), *Menschen und Moden im Siebzehnten, Achtzehnten, und Neunzehnten Jahrhundert* (1906), biographies of Guido Reni, Giorgione, Palma Vecchio, Lorenzo Bernini, and Karl Spitzweg (1907-09), *Biedermeier* (1911), *Miniaturen und Silhouetten* (1918), *Bekleidungskunst und Moderne* (1917), *Vom Kaiserreich zur Republik* (1917), *Modenspiegel* (1919), *Rokoko, Frankreich im*

Achtzehnten Jahrhundert (1919), *England im Achtzehnten Jahrhundert* (1920), and *Das Bühnenkostüm im Altertum, Mittelalter, und Neuzeit* (1921).

BOGARDUS, EMORY STEPHEN (1882-). An American sociologist, born near Belvidere, Ill., and educated at Northwestern and Chicago Universities. At the University of California he was assistant professor of sociology and economics (1911-13) and associate professor (1913-15), and in 1915 he became professor of sociology, and head of the department two years later. He became director of the Division of Social Work at the same institution in 1920 and in the same year editor of the *Journal of Applied Sociology*. He closely identified himself with social work in southern California and has published several works on the subject, among them *Introduction to Sociology* (1917); *Essentials of Americanization* (1919, 1920); and *A History of Social Thought*.

BOGART, ERNEST LUDLOW (1870-). An American economist and writer, born at Yonkers, N. Y., and educated at Princeton and the University of Halle. He held assistant professorships at educational institutions, including his alma mater, and in 1909 became professor of economics at the University of Illinois. He had charge of commodity studies for the research bureau of the War Trade Board in 1918 and in the next year was regional economist in the Foreign Trade Adviser's Office for the Department of State. Among his works are *Economic History of the United States* (1907), *Practical Economics* (1910), *Readings in the Economic History of the United States* (1915), *Centennial History of Illinois* (1918), *Direct and Indirect Cost of the Great World War* (1919), and *War Costs and Their Financing* (1921).

BOGERT, GEORGE GLEASON (1884-). An American lawyer and educator, born in Scotland, and was educated at Cornell University. After studying law he was admitted to the bar in 1908. For three years following, he practiced at Elmira, N. Y., and in 1911 was acting assistant professor of law at Cornell. He became assistant professor in 1912, and professor of law and dean of the College of Law in 1921. In 1920 he was commissioner on Uniform State Laws for New York. During the War he served in many important legal capacities. In 1919 he was appointed lieutenant-colonel and judge advocate in the General Corps. He was author of *The Sale of Goods in New York* (1912), *The Elements of the Law of Trusts* (1914), and *Hornbook on Trusts* (1921). He was for many years editor of the *Cornell Law Quarterly*.

BOGERT, LOTTA JEAN (1888-). An American chemist, born at Scotland, S. D., and was educated at Cornell and Yale Universities. She served as instructor at Simmons College during 1910-12 and at Mt Holyoke during 1911-12. After further studies at Yale, she held teaching appointments there until 1919, when she became professor of food economy and nutrition at Kansas State Agricultural College. Her original investigations have included studies in human nutrition, blood volume, excretion of calcium and magnesium phosphate, and an important research concerning pellagra.

BOGERT, MARSTON (1868-). An American chemist (see Vol. III). During the War he was consultant of the Bureau of Mines and

held a number of important posts in the chemical and gas service of the United States government. He was honorably discharged on May 1, 1919.

BOHEMIA. See CZECHO-SLOVAKIA.

BOHM, MAX (1868-1923). An American artist, born at Cleveland, Ohio, in 1868, and educated at the Cleveland Art School. At 19 he went to Europe, where he was the pupil of Jean Paul Laurens, Lefebvre, and Benjamin Constant. Two years after his first visit to Europe he had a picture in the Paris Salon (1889). In 1898 he won prizes and the gold medal of the Paris Salon, and from that date his list of awards has been exceptionally long. Among them is a gold medal from the Panama-Pacific Exposition 1915. Bohm was elected an Associate of the National Academy in 1917 and a full member in 1920. His best known pictures are "The Family" and "Happy Hours" in the Luxembourg Museum. Bohm's work as a mural painter is well illustrated in the music room of Mrs. Mary Longyear's house in Brookline, Mass.

BOHR, NIELS HENDRICK DAVID (1885-). A Danish scientist, born at Copenhagen, and educated at the University of Copenhagen. When but little over 20, he decided to devote himself to the study of the atom. He became professor of mathematical physics at the University of Copenhagen in 1916 and director of its Institute of Theoretical Physics in 1920. In 1922 he won the Nobel Prize in Physics for his theory in respect to the electric structure of the atom (see CHEMISTRY: *Electronic Theory of the Atom*). In November of the following year he delivered a series of six lectures at Yale University, describing his theory as to how atoms are built up by the binding of one electron after another in an atomic nuclei. This theory has enabled other Danish scientists to discover a new element, hafnium. As a direct result of the Yale lectures, the Rockefeller International Education Board appropriated \$40,000 for the enlargement and extension of Dr Bohr's laboratory at Copenhagen, in order that American students, as well as those of other countries, might work with him. In 1922 he published *Theory of Spectra and Atomic Constitution*. See PHYSICS.

BOILER, MERCURY. See QUICKSILVER.

BOILER CODE. See BOILERS.

BOILERS. With the pronounced tendency to construct steam power plants of increasing size and efficiency during the period from 1914-1924 considerable attention was paid to boilers, and as a result units of larger capacity were installed capable of working at constantly greater pressures, and also at higher conditions of superheat. Not only were units of greater size provided, but also with the increased costs of fuel and labor, it was found necessary to secure the most efficient installations possible, and to provide automatic stokers and similar devices which would ensure regular feeding of the furnaces. This increased economy was seen particularly at public utility power plants where in 1919 a ton of coal produced 625 kilowatt-hours of electricity. In 1923 it produced 835 kilowatt-hours. Of course the boiler installation was responsible for only a part of this efficiency.

Naturally the largest boiler installations were to be found at the great central stations of the electric light and power companies as under

modern conditions it was desirable to concentrate as much generating capacity as possible in large central stations favorably located for obtaining supplies of fuel and condensing water. For the larger central stations the tendency was to standardize the boiler installations with units of from 14,000 to 20,000 square feet of surface, and to provide for the more efficient burning of coal with the increased capacity and at the higher ratings.

A boiler with a record for large size was that built for the Cleveland Electric Illuminating Company with 30,000 square feet of surface. All of these large units, of course, were operated in connection with steam turbines which had become the approved practice in large central stations. Where powdered coal was employed the furnace volume was considerably increased, while with the larger furnace and higher temperatures more attention was being paid to the brick work and thicker, larger walls were employed. A large number of plants were being equipped for the use of oil fuel, and with this object a portion of the installation of the power station of the New York Central Railroad at Yonkers was changed, as well as that of the Singer Building at New York City.

At the Weymouth Station of the Edison Illuminating Company at Boston, and at the Calumet plant of the Commonwealth Edison Company of Chicago, in 1923, experiments were in progress with boilers designed for 1200 pounds pressure which were sufficiently large that they would operate on a commercial load. This type of boiler had an inclined heater and cross-drum with upper and lower decks of two inch tubes separated to accommodate a primary and secondary superheater, the latter being used to reheat the steam exhausted from an extra high pressure turbine before it was delivered into the main heater.

Experiments in Germany by Dr. Wilhelm Schmidt indicated that steam could be generated in boilers at pressures of 800 pounds and higher, to be used in an especially designed reciprocating engine with a gain of some 20 per cent in efficiency over the best turbine practice prevailing. In 1923 Schmidt had a high pressure boiler designed to generate 15,500 pounds at a gauge pressure of 850 pounds. In his reciprocating engine his exhaust had a pressure of 140 pounds passed to a heat accumulator supplying the steam hammers of the shop. The drums of the boilers were forged from a single piece of metal without welded or lifted joints, and were rendered more or less immune to internal stresses by being annealed after forging.

In Sweden about the same time, a boiler designed for 1500 pounds pressure was operating successfully at 900 pounds. Here steam was produced from centrifugally formed shells of water in rotary tubes, 12 inches in diameter. An interesting test plant was installed to test experimentally the Benson super-pressure boiler where steam was generated under critical conditions at 3200 pounds per square inch, and at a temperature of 706 degrees Fahrenheit. This would be utilized by throttling to 1500 pounds, and then after being superheated to 788 degrees Fahrenheit would be passed through a high pressure turbine exhausting 200 pounds pressure. This exhaust steam would then be reheated to 662 degrees Fahrenheit expanded in

a standard turbine and condensed to 29 inches vacuum.

Electric Boilers. An interesting development where coal or oil fuel was costly and water power cheap and abundant, as in the northern United States and Canada, was the use of electric boilers, where electricity was employed to produce steam at the plant of the Laurentide Company of Canada, where in 1923, largest boilers of this type were in service. Each unit had a capacity of absorbing 35,000 kilowatts of electricity and producing 100,000 pounds of steam per hour. Another electric steam boiler installed at Berlin, New Hampshire, employed three phase, 60-cycle current at 22,000 volts, and had a capacity of 18,000 kilowatts generating steam at 135 pounds pressure.

National Boiler Code. A committee of the American Society of Mechanical Engineers, appointed in 1911 to consider the subject of a comprehensive national code for the construction and installation of steam boilers, presented a preliminary draft of such a measure at the annual meeting of the society in 1914. This code was approved by the council of the Society in 1915, and straightway it was recommended as a basis for uniform state and municipal legislation. In preparing the draft the Massachusetts and Ohio state regulations were adopted as a basis, and all interested manufacturers, users and engineers were invited to make suggestions. The report and the accompanying code deal in detail with specifications for steam boilers and boiler tubes.

Uniform rules for safety valves, fire tube and water tube boilers, and steam and hot water heating boilers combined practice with theory so that the interests of all were protected and the safety of the public was insured. The American Uniform Boiler Law Society was formed to further the adoption of this code which secured the approval of a number of states and the enactment into statutes. In fact it received such general approval that the specification for boiler work on the Panama Canal provided that construction should be in accordance with the code with alternate bids on boilers not so constructed.

This code came into effect in 17 states, the District of Columbia, and the Panama Zone, and in 14 cities. The states adopting the code included the more important states such as New York, New Jersey, Pennsylvania, Ohio, California, Minnesota, Wisconsin, Michigan and Indiana.

Mercury Boiler. The period from 1914 to 1924 witnessed the culmination of some successful experiments by W. M. L. Emmet in the development of a mercury boiler and turbine, where mercury vapor took the place of steam. Inasmuch as mercury vapor has a vapor pressure lower than that of steam its expansive force under the action of heat would be correspondingly greater, and for the same expenditure of fuel more energy would be developed. It was this increased theoretical economy that interested engineers and between 1914 and 1924 Emmet was working on a practical solution of the problem. In 1923 after some 15 different experimental designs had been developed a working installation was built and placed in commercial service at the Dutch Point Station of the Hartford Electric Light Company. This equipment was designed to develop 1800 kilowatts from the mercury turbine gen-

erator, while in addition at least 28,000 pounds of water steam would be generated from the condensing mercury, though up to the end of 1923 the plant had not been operated to generate more than 15,000 kilowatts and 27,000 pounds of steam per hour. In this Hartford boiler which was oil fired, mercury was vaporized at 812 degrees Fahrenheit and 35 pounds pressure. The vapor then passed to a special turbine engine, where it was expanded to 29-inches vacuum and 414 degrees Fahrenheit. The temperature of condensation was used in a connected steam boiler to generate steam for an ordinary steam turbine, or for delivery to the main steam line. Theoretically there was a considerable margin of economy to be gained, and it was stated that for each pound of fuel consumed a mercury-steam plant would afford 52 per cent more electrical output than an ordinary efficient steam turbine installation operating at 100 pounds pressure, while if the mercury equipment were added to the same turbine installation for an increase in fuel of 18 per cent, there would be an additional output of some 80 per cent. The Hartford equipment held about 32,000 pounds of mercury, which was evaporated at a rate of 230,000 pounds of mercury per hour, or in other words all the mercury used in the system would be vaporized about eight times in an hour. It required about 8.5 pounds of mercury to make 1 pound of steam. It was believed that in future installations there could be a considerable reduction of the amount of mercury required by reducing the size of the mercury spaces in the mercury boiler and mercury economizer.

A new edition of *Steam Boiler Economy* by William Kent was published in 1915, discussing modern practice up to the time of its publication.

BOISSEVAIN, INEZ MILHOLLAND (1886-1916). An American suffrage leader and lawyer, born in New York. She was graduated from Vassar College in 1909, and being refused admittance to Oxford, Cambridge, and the Harvard Law School on account of her sex, she entered the New York University Law School. Inez Milholland, as she was known in suffrage circles even after her marriage to Eugene Boissevain, a Dutch electrical engineer, was prominent at college for her championship of radical social ideas. Part of her time was devoted to court probation work in Poughkeepsie. During a vacation she went to England, joined Mrs. Pankhurst's forces, and was arrested in a demonstration. In 1912 she aided the shirtwaist strikers in New York. Her methods were somewhat spectacular, but her enthusiasm and ability as a speaker and organizer made her invaluable to the Woman's party and the Congressional Union, with which she was identified. She died on Nov. 25, 1916, at Los Angeles, Cal., where she had been overtaken by illness during a speaking tour for the Woman's Party.

BOJER, JOHAN (1872-). A Norwegian novelist (see VOL. III). In 1916 he published *Sigurd Braa*, a drama. He is also the author of the following works, all of them translated into English: *The Great Hunger* (1916), *The Face of the World* (1917), *God and Woman* (1920), and *The Last of the Vikings* (1922). In 1923 he visited the United States. See SCANDINAVIAN LITERATURE, Norwegian.

BOX, EDWARD WILLIAM (1863-). An American editor and author (see VOL. III). In 1919 he resigned from the editorship of *The*

Ladies' Home Journal. He has written *Why I Believe in Poverty* (1915), *The Americanization of Edward Bok* (1920), *Two Persons: an Incident and an Epilogue* (1922), and *The Man from Maine* (1923). He was the originator of the American Peace Award, a prize of \$100,000 offered in 1923 for the most practicable plan for securing permanent world peace.

BOKHARA. Formerly a dependency of the Russian Empire with a crowned head, but since the Revolution, an independent republic. It is situated in Central Asia, has an area of 79,440 square miles, and an estimated population of 3,000,000. Bokhara, the capital, has a population of 75,000; Karshi, 25,000. Its civilization is typically Asiatic, the Occidental life pressing all about it having touched it not at all. The activities of the people still indicate the pastoral and handicrafts stages. Corn, fruit, silk, tobacco, cotton, and hemp are produced; goats, sheep, horses, and camels are bred. Green tea, to the amount of 1125 tons yearly, was imported from India, which, in turn, received almost all of Bokhara's raw silk.

In September, 1920, the reigning Amir, Mir Alim Khan, was deposed as the result of the return of the exiled Bokharan progressive intellectuals who received help in arms and troops from Soviet Russia. A Soviet government was set up and an attempt made to modernize the country by closing the theological schools and introducing secular education. But religious feeling was too deeply implanted and a revolt at once broke out, in which Enver Pasha took a prominent part, which dragged on through 1922, principally in the mountainous districts of Eastern Bokhara. A Soviet force defeated Enver's troops in July, 1922, and Enver was reported killed. It was ascertained that the rebels received material aid from Afghanistan. Like the other Russian Succession States, Bokhara was treated generously by Russia and its independence assured through military and political agreements. (A political treaty on Mar. 4, 1921, and an economic treaty on the same day, were signed.) See RUSSIA.

BOLIVIA. A South American republic, and the only country on the Western Hemisphere that has no direct access to the sea. It is situated west of Brazil and northeast of Chile. Its area is estimated at 560,000 square miles, certain territories still being in dispute; and its population is estimated at 2,820,000. La Paz, the largest city and the actual seat of government, has a population of 107,250. Other large and important cities are: Cochabamba, 30,818; Potosí, 29,795; and Sucre, 29,686.

Industry. Although mining was the principal factor of economic wealth in the country, agriculture continued to be the leading occupation of the people. Of the agricultural products, rubber was the most important. The rubber industry was centred in the departments of Beni and Santa Cruz. Rubber, in fact, was second in importance only to tin. The crude rubber production of Bolivia was only slightly inferior to that of Brazil, and many thousand acres of wild rubber trees were available. Bolivia was, however, the second tin-producing country in the world, ranking after the Malay Straits Settlements, and in 1923 it was reported that Bolivia had taken the lead in world production of this mineral. Besides this, Bolivia produced important quantities of wolfram, silver, lead, antimony, copper, and zinc. Con-

siderable prospecting and some drilling for oil was undertaken during the period, particularly in the eastern part of the country, but no large production was reported. In 1921, the last year for which statistics were available, mineral exports constituted over 81 per cent of the total export (54,604,131.51 bolivianos, out a total of 66,919,445 bolivianos). Exportation of important minerals for 1921 was as follows: tin, 11,811,145 kilos for 42,909,303 bolivianos; silver, 16,719,027 kilos for 10,473,265; copper, 13,330,801 kilos for 5,970,680. (One kilo equals 2.2 pounds, and one boliviano equalled \$0.23 average for 1921.)

Commerce. The total commerce of Bolivia or the year 1921 was approximately 30 per cent greater than the total figures for 1914. Practically the entire increase was due to larger importations, however, which increased from 19,761,222 bolivianos in 1914 to 70,853,152 bolivianos in 1921. The year 1918 marked the high level of exports, the year's total trade figures passing the 217,000,000 bolivianos mark. The 1920 total trade, however, was the largest of any year in the period 1914-21 inclusive. Following are the trade figures for the more important years of this period (in bolivianos):

Year	Importations	Exportations	Total
1914	19,761,222	65,801,146	105,562,368
1916	31,098,215	101,484,800	132,583,015
1918	34,999,886	182,612,851	217,612,737
1920	65,339,505	156,018,745	221,358,250
1921	70,853,152	66,919,445	137,772,597

The chief articles of import were manufactured articles, foodstuffs and beverages, and textiles. The United States was the chief country to gain by Germany's disappearance from the competitive market. However, Great Britain also made rapid strides in obtaining the trade of Bolivia. In 1921, the United States supplied 28.40 per cent of Bolivia's imports, and took slightly over 37 per cent of her exports; the United Kingdom supplied 23.79 per cent and took 53 per cent. In 1919, the United States took 41 per cent of Bolivia's exports, and Great Britain 49 per cent.

Communications. In 1922, total length of allways in operation was 1100 miles including a new line, opened in July, 1917, from Oruro to Cochabamba. In addition 230 miles were under construction. A line was also projected to tap the oil lands in the east, but by 1924 no construction work was under way. In 1921, line from Atocha to Villazón was commenced, to be completed early in 1925. The importance of this road lay in the fact that it would connect with the Argentine frontier and thus form another means of transcontinental transportation, via La Paz. Work was proceeding on this road in 1924, and considerable sums were being spent to push it to completion.

Finance. The cost of government steadily mounted, and large deficits were returned each year. The 1924 budget called for revenues of 3,938,533 bolivianos, and expenditures of 8,623,832 bolivianos, a deficit of 14,685,299 bolivianos. In 1912, revenues and expenses were almost equal at about 17,300,000 bolivianos. In 1922, the deficit was over 20,000,000 bolivianos. Annual charges for the foreign debt were estimated at 12,500,000 bolivianos; \$500,000 for internal debt, and 5,000,000 to customs house warrants. On May 28, 1923, the

foreign debt of Bolivia was reported as 91,365,100 bolivianos; internal debt, 13,852,555 bolivianos, and floating debt 6,345,354 bolivianos. This would make a total in dollars of \$36,855,986, or approximately \$13 per capita. A refunding loan of \$24,000,000 was authorized in the United States in 1922, and a loan of 12,000,000 bolivianos was secured in 1923, to be applied to the deficit.

Education. An increasing interest was evinced in education in Bolivia. It was both free and obligatory. There were 504 national primary schools, about 650 municipal schools, and about 108 private schools, making a total of 1265 schools for lower education. Also, 16 higher-grade schools were established, besides the National School of Commerce at La Paz, and the University at Sucre, which bestowed degrees in law, medicine and theology. There were several specialized technical schools. The best secondary institutions were those schools endowed by American Methodists at La Paz and Cochabamba.

History. General Ismael Montes was once more elected president of the republic for the term 1913-17, to succeed President Villazón. During his administration the effects of the War were felt in the decline of exports, though purchases by the United States lightened the stringency considerably. As a result of Germany's submarine campaign, Bolivia broke off diplomatic relations in April, 1917, and thus became one of the signatories of the Peace Treaty in 1919 as well as an original member of the League of Nations. For the term 1917-21, Sr José Guerra was elected, but he was compelled to resign and leave the country in 1920, as the result of a revolution caused by his friendliness toward Chile. In January, 1921, Sr. Bautista Saavedra, leader of the revolution, was elected president by the National Assembly, he was recognized by the United States in February.

Bolivia's boundary lines with her neighbors were amicably settled, the Bolivian-Peruvian frontier being fixed in 1915, the Bolivian-Brazilian in 1920, and the Bolivian-Argentine in 1913. The Bolivian-Paraguayan frontier, provided for by treaty in 1913, had not yet been delimited in 1924 because of the disputed Gran Chaco region. Bolivia, because of her desire for an outlet to the sea, was precipitated into the Tacna-Arica dispute (q.v.), and in spite of the advances made by Chile, aligned herself with Peru. Bolivia's claim for a corridor through Tacna was placed before the Peace Conference with no results. In 1920, in a protest to Chile on the matter of the treaty of 1904 which perpetually barred Bolivia from the Pacific, the Bolivian government called for a reopening of the question on the grounds of its international importance. Bolivia placed her claims before the United States government, which had been chosen mediator of the whole question, in 1923.

BOLL WEEVIL. See COTTON; AGRICULTURE.

BOLLWORM, PINK. See ENTOMOLOGY, ECONOMIC.

BOLO, RAUE (PASCHA) (?-1918). A French adventurer. By 1914, as a result of his shady financial operations, Bolo Pasha (a title gained from the Egyptian Khedive) was known in the demimonde of two continents. In 1917 he was arrested for treason; it was charged that he was in the hire of German agents. In particular,

he was accused of having traveled in the United States, in 1915-16, in the interest of Count von Bernstorff, German ambassador at Washington. He was tried in February, 1918, and shot at Vincennes, Apr. 17, 1918. An attempt was made two years later to link Caillaux's name with Bolo's.

BÖLSCHÉ, WILHELM (1861-). A German writer on science, born in Cologne. He studied philology but specialized in nature and literature and has written on scientific subjects in a peculiarly fascinating style. He is the author of *Naturwissenschaftliche Grundlagen der Poesie* (1887), *Entwicklungsgeschichte der Natur* (1893-96), *Darwin* (1898), *Liebesleben in der Natur* (1898-1902), *Vom Bazillus zum Affenschen* (1899), *Huckel* (1900), *Goethe* (1900), *Entwicklungslehre* (1900), *Hinter der Weltstadt* (1901), *Sonnen und Sonnenstaubchen* (1902), *Die Eroberung der Menschheit* (1903), *Aus der Schneeegrube* (1904), *Die Abstammung der Menschheit* (1904), *Weltdruck* (1904), *Naturgeheimnisse* (1905), *Stammbaum der Tiere* (1905), *Sieg des Lebens* (1905), *Auf dem Menschenstern* (1909), *Stunden im All* (1909), *Was Ist die Natur* (1907), *Menschen der Vorzeit* (1909), *Komet und Weltuntergang* (1910), *Festland und Meere im Wechsel der Zeit* (1913), *Stirb und Werde* (1913), *Menschen der Zukunft* (1913), *Tierwanderung in der Urwelt* (1914), *Neue Welten* (1915), *Stammbaum der Menschheit* (1916), *Schutz und Trutzbündnisse in der Natur* (1917), *Eiszeit und Klimawechsel* (1919), etc. Bölsché has also written some fiction and has edited the works of Goethe, Hauff, Novalis, Uhland, Heine, and others.

BOLSHEVISM. Russian Bolshevism is merely an application of the well-known doctrine of Communism familiar to Europe since the publication of the *Communist Manifesto* in 1847. Its system includes these main precepts: the capture of the means of production and distribution by the proletariat, by force if necessary, and the continued dictatorship of society by this proletariat, even though it should constitute a minority. The word Bolshevism is derived from Bolshevik (Russian *Bolshevik*, plural *Bolsheviks*) the name applied to the members of the majority (Russian *bolshinstvo*) at the second Congress of the Russian Socialist party in 1903, as opposed to the *Mensheviks* or minority. This antagonism between the two wings of Russian socialism, centring mainly in the rejection, by the Bolsheviks, of democratic control, was continued up to the Russian Revolution (1917), and after it served largely, too, to divide European and American socialism into two camps, the first of which was ready to accept the Bolshevik doctrine of the dictatorship of the proletariat, and the second to repudiate it. Of the latter group may be mentioned the Englishman MacDonald, the German Kautsky, the Americans Berger and Hillquit. In the United States, after 1917, the term Bolshevism was applied loosely to almost all movements that aimed at radical change in the existing system of private ownership, whether the means advocated were peaceful or violent. For the history of Russian Bolshevism, see RUSSIA. See also COMMUNISM for other developments in theory and practice.

BOLTON, GUY REGINALD (?-). A dramatic author, born in England. His first play, *The Drone*, written in collaboration with Douglas J. Wood, was produced in New York in

1911. After 1911 he wrote many plays, mostly in collaboration. Those on which he worked with P. G. Wodehouse included *Have a Heart* (1917); *Leave It to Jane* (1917); *Miss 1917* (1917); *Oh! Boy* (1917); *The Riviera Girl* (1917); *Ringtime* (1917); *Ask Dad* (1918); *The Girl Behind the Gun* (1918); *See You Later* (1918); and *The Rose of China* (1919). With George Middleton he wrote *Polly with a Past* (1917); *Adam and Eva* (1919); *The Light of the World* (1920), and *The Cave Girl* (1920). In association with Wodehouse and the composer, Jerome Kern, he produced musical comedies of a novel elegance and refinement which were presented at the Princess Theatre (New York).

BOLTON, THADDEUS LINCOLN (1865-). An American psychologist, born at Sonora, Ill., and educated at Michigan and Clark Universities. After teaching in secondary schools, he became successively professor at the University of Washington (1897-98), University of Nebraska (1899-1910), and University of Montana (1912-17). In 1917 he became professor of psychology at Temple University (Philadelphia), and in 1919, lecturer at the Philadelphia School of Occupational Therapy. His experimental researches include papers on rhythm, growth of memory, fatigue, motor power and intelligence, efficacy of consciousness, and inheritance of special traits.

BOLTWOOD, BERTRAM BORDEN (1870-1927). An American chemist, born at Amherst, Mass., and educated at Yale University and abroad, chiefly in Munich. In 1894 he became an assistant in the chemical laboratory of the Sheffield Scientific School, and two years later an instructor in physical chemistry at Yale. During 1900-06 he devoted his attention to research, chiefly in radium and radio-activity. He returned to Yale in 1906 and was made assistant professor of physics but spent the years 1909-10 at the University of Manchester, where he held a John Harding fellowship. In 1910 he resumed his teaching at Yale as professor of radio-chemistry and in 1918 became director of the Kent Chemical Laboratory. His published papers have been devoted for the most part to his specialty, radium, and its activities. On this subject he is perhaps the foremost authority in the United States.

BOMB, AIRCRAFT. See BOMBING OF VESSELS, BY AIRCRAFT.

BOMB, DEPTH. A portable submarine mine carried by vessels in the Allies' anti-submarine service during the War, and by some others, for use against submarines which were submerged. The bombs were of two types: stick bombs for projection by bomb-throwers, and plain cylindrical bombs for dropping or ejection from chutes. The bomb case was cylindrical, of sheet steel, and had a ring in each end for handling and securing. In stick bombs, the stick was secured in the cylinder like the handle of a hammer. In using either a single barrel or a Y gun bomb-thrower, the stick of the bomb was inserted in the muzzle. The firing mechanism of the bomb could be set to cause explosion at any desired depth, and the safety key was connected with the depth control. The charge was from 50 to 300 pounds of light explosive depending on the size of the bomb. When a destroyer or patrol boat passed over the supposed position of a submarine, bombs were slid overboard from the chutes astern or projected

from the bomb-throwers, which could throw them about 40 yards. The depth bomb was the most important weapon used against submarines in the War, and according to British reports, it destroyed 34 of them. The explosion of a 300-pound depth bomb was always fatal at distances of 25 feet or less and even at more than 30 feet if the explosion took place below the plane of the submarine and not too near the surface. At moderate distances beyond the fatal range, the violence of the explosion caused serious leaks and often put out of action much of the operating mechanism thereby forcing the boat to the surface or to the bottom, while the effect on the nerves of the crew was severe. See BOMBING OF VESSELS; MINE, SUBMARINE; NAVIES OF THE WORLD; SUBMARINES AND THEIR WAR ACTIVITIES.

BOMBING OF VESSELS, BY AIRCRAFT. The use of bombs by aircraft in the attack of vessels was, during the War, chiefly directed against submarines. The bombs were small and of the type employed against troops, fortifications, arms factories, railways, and the like, in the attack of which numbers were usually more important than great size. Although large bombing planes and large bombs were developed during hostilities, their use was exceptional. Since the close of the War, and particularly since 1920, the large bombing plane designed to attack naval vessels of the best protected and most powerful type has received much attention and is being steadily improved. The first extensive tests in the United States were made in July, 1921. The ex-German battleship *Ostfriesland*, the cruiser *Frankfurt*, the destroyer *G-102*, and the submarine *U-117* were the vessels attacked. Both army and navy planes joined in the operations. The vessels withstood attack remarkably well. Bombs of 600 pounds and less which landed on the deck of the *Ostfriesland* produced local damage only. She was finally sunk by 2000-pound bombs which exploded under water close alongside.

Still more interesting tests were carried out in the summer of 1923. The old battleships *New Jersey* and *Virginia* were the targets. The ships were anchored. The weather was mild and so clear that approaching planes were visible 15 miles away. In fact, all conditions were abnormally in favor of the attacking force. The first attack was made on the *New Jersey* from a height of 11,000 feet by five Martin bombers, each carrying four 600-pound bombs and one 100-pound sighting bomb. The planes moved in column, half a mile apart, in a large circle, and each dropped one bomb every time it passed over the target. Three hits were made, but the bombs exploded above decks and damaged only upper deck plating and fittings. The next attack was made by seven bombers at a height of 6000 feet, with each plane carrying one 2000-pound bomb. No hits were made, but one bomb exploded close alongside. The ship took a slight list, and it was thought she would sink; consequently, the next attack was made on the *Virginia* by seven bombers at 3000 feet, each carrying two 1100-pound bombs. One bomb struck the ship, and breaking through one or more decks, exploded below with enormous effect; the masts, smokepipes, upper deck, and upper works were demolished. Thirty minutes later, the vessel turned over and sank. Four hours after the attack with 2000-pound bombs, as the *New Jersey* was still afloat with only a

slight list and no serious injury to masts, turrets, guns, or anything except light plating which was perforated and torn by the explosions and fragments of the 600-pound bombs, she was assailed by seven bombers, each carrying two 1100-pound bombs and flying at 3000 feet. No hits were made, though apparently one bomb fell near enough to increase the ship's list slightly. Two more bombers then appeared and dropped three 1100-pound bombs; one of these made a direct hit, and one fell close alongside. The bomb which hit broke its way through one or more decks and burst below, opening up the side or bottom plating so that the ship turned over and sank in five minutes.

If, in these tests, the vessels had been underway and steering zigzag courses at varying speeds, no hits would have been made except by accident. Had the upper decks been lightly armored, no explosions would have taken place below decks and the resulting injuries would have been no greater and perhaps less than the hit of a single 16-inch shell. Had the vessels been fitted with cellular anti-torpedo belts, the bombs which fell close alongside would have caused no serious damage except a slight reduction in speed. If in addition the vessels had been equipped with anti-aircraft batteries, smoke shells, and smoke-producing apparatus, and if they had been accompanied by an aircraft carrier with a squadron of combat planes designed for attacking bombers, then the attacking force would have been in much greater danger than the ships. In the present state of bomber development the vessels which have most to fear from them are light cruisers and auxiliary vessels, especially fuel and supply ships and transports. These ought not to approach within 200 miles of a shore bomber station without adequate protection by aircraft, by swift patrol vessels carrying numerous anti-aircraft guns and other defensive apparatus, or by both. See BOMB, DEPTH; GUNNERY, NAVAL; ORDNANCE.

BONE, MUIRHEAD (1876-). A British painter and etcher, born at Glasgow, and educated at the Glasgow Evening School of Art. In 1897 and the following years he produced excellent work in black and white for the *Scotts Pictorial*. He established himself in London in 1891 and there quickly made a reputation by his etchings. He assisted prominently in founding the Society of Twelve and he was elected a member of the New English Art Club. The National Art Collections Fund in 1906 bought his etching, "The Great Gantry, Charing Cross," and presented it to the British Museum. He was appointed official artist on the western front and with the fleet by the British War Office from 1916 to 1918, and some of his drawings were subsequently reproduced in volume form. They include every phase of activity on the western front, military operations, hospital scenes, and camp and trench life. Chalk line and wash are successfully used to give rhythm, form, and atmospheric effect; in others of these sketches, charcoal is the medium. Mr. Bone has also done numerous individual portraits.

BONE, SCOTT CARDELL (1860-). An American editor and governor born in Shelly County, Ind., and educated in the public schools. He wrote for the Indianapolis newspapers and later identified himself with the *Washington (D. C.) Post* for 17 years, first as news editor and later as managing editor. He owned and edited the *Washington Herald* (1906-11), and

in 1911-18 he was editor-in-chief of the *Seattle Post-Intelligencer*. In 1914-15, he was chairman of the Alaska Bureau of the Seattle Chamber of Commerce, and in 1921 was appointed Governor of Alaska, having held in the interim several positions of a political nature.

BONNER, GERALDINE (1870-). An American author (see VOL. III). Her later work includes *The Girl at Central* (1914), *The Black Eagle Mystery* (1916), *Treasure and Trouble Therewith* (1917), and *Miss Maitland, Private Secretary* (1919).

BONNET, JOSEPH (1884-). A famous French organist, born at Bordeaux. Under his father's instruction his progress was so rapid that at the age of 14 he was appointed regular organist at St. Nicolas and, a little later, at St. Michel, where his recitals attracted attention. He then entered the Paris Conservatoire, where he studied with Guilman and carried off the first prize. In 1906 he won in competition the coveted post of St. Eustache, Paris; all competitors were first-prize winners of the Conservatoire. This position he has filled since then but has been allowed frequent leave of absence for extended concert tours all over Europe. In 1917 he made his first tour of the United States and met with such success that he has repeated his visit annually. He aroused special enthusiasm with his series of five historical recitals, as well as with his extraordinary improvisations. In 1922 he organized in Rochester, N. Y., after the model of that of the Paris Conservatoire, a fully equipped organ department at the Eastman Conservatory. His original compositions for the organ are held in high esteem.

BONNEY, THOMAS GEORGE (1833-1923). An English geologist (see VOL. III). Among his later publications are *The Present Relations of Science and Religion* (1913); the text to *Anderson's Volcanic Studies* (1917), and *Memoirs of a Long Life* (1922).

BONSAL, STEPHEN (1865-). An American newspaper correspondent (see VOL. III). In 1914 he was Commissioner of Public Utilities in the Philippine Islands. He was sent on a special mission to Mexico in 1915 and was also with Hindenburg's army on the eastern front in the same year. In 1916 he was advisor at the American-Mexican Conference. In the following year he was commissioned major in the national army and was on duty in the War College in Washington. He went to France with the American Expeditionary Force in 1918 and was American representative at the Congress of Oppressed Nationalities. He was appointed lieutenant-colonel of infantry, attached to the American mission to the Peace Conference

after the Armistice, and in 1919 was American member of the inter-Allied mission to Austria-Hungary under General Smuts and of the special mission to Germany and Bohemia.

BOOTH, EVANGELINE CORY (?-). A commander of the Salvation Army and daughter of William Booth, founder of the Salvation Army. She was born in England and educated in London, later commanding field operations of the Salvation Army in Great Britain, Canada, and the Klondike, and in 1904, in the United States, with approximately 3000 officers and cadets and over 1200 corps and institutions under her. During the War she did noteworthy work, for which the United States government awarded her the Distinguished Service Medal (1919).

BOOTS AND SHOES. In the production of boots and shoes the United States in 1924 ranked first, followed by Great Britain and Germany, and in addition to its own domestic consumption it had a considerable export business. Naturally the manufacture of boots and shoes was seriously interfered with by the War and subsequent readjustment period as it affected the production, price of leather and the normal distribution. In 1921, according to the Bureau of the Census, boot and shoe manufacturing ranked fourteenth among the industries of the United States, with a product valued at \$867,476,000 though in the previous census of 1919 its value was \$1,155,041,000.

According to the census of manufactures of 1919 New England was the centre of the boot and shoe industry and produced more than 49 per cent of the total value of the country's output. Of the different states Massachusetts ranked first with a production of 116,944,018 pairs produced by 492 establishments, followed by New York with 62,246,321 pairs produced in 342 establishments; New Hampshire with 22,700,694 pairs produced in 52 establishments; Pennsylvania with 23,617,362 pairs from 123 establishments; Missouri with 26,362,367 pairs from 54 establishments, and Ohio 17,870,140 pairs from 60 establishments. The five leading cities in the production of boots in the United States are Brockton, Massachusetts, New York City, Lynn, Massachusetts, St. Louis, Missouri, and Haverhill, Massachusetts.

The condition of the industry in the interval from 1914 is shown in the accompanying tabulation from statistics published by the Bureau of the Census. Whereas in 1922 the total production of boots and shoes, exclusive of rubber footwear, was 323,876,458 pairs, or an increase of almost 11 per cent from 1914, the production in 1923 was 351,114,273 pairs, marking a record for the industry.

PRODUCTION OF BOOTS AND SHOES IN THE UNITED STATES

Kinds	1914	1919	1921	1922
	Pairs	Pairs	Pairs	Pairs
Total boots and shoes	292,666,468	331,224,628	286,771,101	323,876,458
High and low cut (leather) (total) . . .	265,642,260	291,540,408	241,838,226	280,366,192
Men's	98,031,144	95,017,356	69,457,535	99,984,065
Boys' and youths'	22,895,719	26,503,432	18,462,032	21,631,905
Women's	80,916,239	104,812,505	101,473,985	105,367,667
Misses' and children's	48,322,395	48,533,203	35,065,527	39,448,554

Athletic and sporting (leather)	(*)	585,710	5,546,898	8,448,308
Canvas and other textiles	(*)	11,050,363	8,601,582	6,739,399
All other (slippers and miscellaneous footwear)	27,024,208	28,042,147	30,784,395	28,322,619

* Not reported separately.

The principal types of shoes manufactured in the United States may be divided as follows: Goodyear welted, McKay sewn, screw or metallic fastened, stitched down and turned. In 1919, 38 per cent of the shoes manufactured were of the Goodyear type, 36 per cent were McKay sewn, 19 per cent were turned and 4 per cent were standard screw or metallic fastened. In the United States the prices for shoes increased from 1913, during the War reaching a peak in 1920, as indicated by the accompanying table.

AVERAGE WHOLESALE PRICE PER PAIR OF LEATHER BOOTS AND SHOES IN THE UNITED STATES

From data published by the United States Department of Labor

Year	Men's			Women's		
	Black calf Good-year welt blucher	Black calf Good-year welt bal	Black vic kid Good-year welt	Black kid lace Good-year welt	Patent-leather pump, McKay sewn	
1913	\$3.11	\$3.16	\$2.86	\$3.00	\$1.37	
1914	3.17	3.28	2.98	3.00	1.45	
1915	3.25	3.35	3.10	3.00	1.50	
1916	3.71	3.88	3.50	3.44	1.90	
1917	4.75	5.14	5.06	4.49	2.75	
1918	5.62	5.31	5.44	4.37	2.93	
1919	7.60	7.10	7.24	6.59	4.07	
1920	8.95	7.50	8.33	7.66	4.86	
1921	7.00	4.80	6.39	5.06	4.00	
1922	6.50	4.61	5.83	4.33	3.60	

From that time there was a recession tending towards more suitable prices but not reaching those prevailing before the War. In the American shoe industry there was a tendency towards consolidation and larger factories, so that

LEATHER BOOT, SHOE, AND SLIPPER EXPORT TRADE OF THE UNITED STATES

Division of Statistics, Bureau of Foreign and Domestic Commerce. Figures for 1913 are for fiscal year; all others are for calendar years

Year	Total	Men's shoes	Women's shoes	Children's shoes	Slippers
	Pairs	Pairs	Pairs	Pairs	Pairs
1913	10,650,160	5,260,531	3,217,544	1,826,719	345,366
1919	21,682,751	11,928,156	5,891,753	3,534,670	328,172
1920	17,069,254	7,711,310	5,064,472	4,065,810	227,662
1921	9,019,263	5,173,776	1,767,880	2,016,041	61,566
1922	5,532,933	1,878,259	2,280,065	1,246,338	128,271

the number of establishments decreased during the decade.

Also, the industry suffered from the variations due to fashion, some of which were of long life and led to considerable margin of profit by the retailer on sales actually made, while others were but temporary in their vogue. There was a tendency to decrease the number of styles and to standardize the production, but it was felt that fashion played an important part in the industry as at times there would be a vogue of low shoes in preference to those higher cut, and various temporary fashions more or less short lived.

In addition the shoe industry suffered due to the increased use of motor cars and taxicabs, and it was estimated in 1923 that the average life of a pair of shoes was 25 per cent more than a few years previously before the motor car was so universally used in the rural districts, and in urban communities such means of transportation as motor busses and taxicabs had developed.

In 1923 the exports of shoes from the United States were as follows:

EXPORTS OF SHOES IN 1923

Men's and Boys'	3,187,623 pairs, valued at \$10,029,918
Women's	2,292,961 " " " 5,302,641
Children's	1,861,413 " " " 2,183,780
Slippers	239,042 " " " 295,390

In 1923 there were imported into the United States 398,929 pairs of all leather boots and shoes, valued at \$1,246,176; 653,964 pairs of slippers valued at \$280,015, and 884,862 pairs valued at \$357,810. In 1921 the exports included 2,600,000 pairs of men's shoes sent to Russia.

The accompanying table will show the extent of the boot and shoe export trade of the United States which developed extraordinarily in the years immediately following the War when the European markets were larger consumers of American shoes. Ordinarily Cuba, Mexico, Jamaica, Panama, the Dominican Republic, Newfoundland and Labrador and the United Kingdom and Canada are the most important export markets for the United States, though Australia, British South Africa and some South American, Asiatic and European countries take a quota. See also LEATHER.

BORAH, WILLIAM EDGAR (1865-) An American politician (see VOL III). He was again elected to the Senate in 1919. During the War he took an active part in all matters relating to war measures, while opposing the League to Enforce Peace, and violently advising against the policy of President Wilson, especially in regard to the League of Nations. As delegate-at-large from Illinois, he spoke successfully against the League at the Republican national convention of 1920. He also opposed

the Four-Power Treaty, believing that the United States should stand aloof.

BORCHARD, EDWIN MONTEFIORE (1884-). An American lawyer and educator, born in New York City. He attended the College of the City of New York and afterward studied at New York Law School and the Columbia University Law School. In 1910 he was expert on international law of the American agency of the North Atlantic coast fisheries arbitration at The Hague. In the same year he traveled through Europe for the Library of Congress and investigated and collected literature on continental law. He was law librarian of Congress from 1911-16. In 1915 he accumulated commercial law material for the Department of Commerce. In 1917 he was appointed professor of law at the Yale University Law School. His published writings include *Guide to the Law and Legal Literature of Germany* (1911); *The Diplomatic Protection of Citizens Abroad* (1916); *The Declaratory Judgment* (1918), and *Latin-American Commercial Law*, with T. E. Obregon (1920).

BORDEAUX, HENRI (1870-). A French

novelist and critic, born at Thonon, Haute-Savoie, and educated at the Collège de Thonon, the Collège Stanislas (Paris), the Sorbonne, and the Faculty of Law (Paris). In 1889 he was admitted to the bar at Thonon and spent two years in his father's law office. He then went to Paris as counsel for the Paris-Lyons-Méditerranée Railroad. His father died in 1896, and he was obliged to return to Thonon and go on with his father's practice. After five years, however, he was able to go back to Paris and devote the rest of his life to letters. In the War he began his service on Aug. 1, 1914, as captain of infantry, was then transferred to the General Staff of the 1st Army in Lorraine, then to the 2d Army at Verdun, and finally to General Headquarters. He was sent on a mission to Verdun in 1917, and received two citations and the rank of Chief of Battalion for his work. In 1920 he was received in the French Academy, taking the place of Jules Lemaitre. His first book, *La Course à la Vie* (1893), was a volume of poems, but he soon turned to the novel and critical essay. His writings show him to be a moralist and psychologist rather than a stylist. Yet he does not write *romans à thèse* or belong to the naturalist school. He is a realist, but his realism consists in the depicting of the cultured classes. He pleads the cause of society against the individual and upholds tradition, especially that of the family. Some of his more important works are *Jeanne Michelin*, his first attempt at a novel (1895); *Le Pays Natal* (1900); *La Voie sans Retour* (1901); *La Peur de Vivre*, crowned by the French Academy (1902); *L'Amour en Fuite* (1903); *La Petite Mademoiselle* (1905); *Les Yeux Qui s'Ouvrent* (1908); *La Croisée des Chemins* (1909); *La Robe de Lune*, considered one of his best novels (1910); *La Neige sur les Pas* (1911); *La Maison* (1913); and *La Maison Morte* (1922). Among his works of a critical nature are *Vies Intimes* (1904); *Portraits de Femmes et d'Enfants* (1909); *La Vie au Théâtre*, 4 vols. (1910-21); *Quelques Portraits d'Hommes* (1914); *Jules Lemaitre* (1920), and *La Jeunesse d'Octave Feuillet, 1821-90* (1922). Inspired by the War were *La Jeunesse Nouvelle* (1915); *Trois Tombes* (1916); *Les Derniers Jours du Fort de Vaux*; *Les Captifs Délivrés*; *La Chanson de Vaux-Douaumont* (1917); *La Vie Héroïque de Guynémér* (1918); *Sur le Rhin* (1919); *Le Plessis-de-Roye* (1920), and *La Résurrection de la Chair* (1920).

BORDEN, RT. HON. SIR ROBERT LAIRD (1854-). A Canadian statesman (see VOL. III). In 1914 he was created Grand Commander of the Order of St. Michael and St. George, in 1915 he received the Grand Cross of the Legion of Honor, and in 1916 the Grand Cordon of the Order of Leopold. He was honored with the freedom of the city of various British municipalities. In 1917 he formed a Union Government and was appointed Secretary of State for External Affairs. He was a member of the Imperial War Cabinet, the Imperial War Conference held in London, 1917-18, and was present at the Paris Peace Conference in 1919 as a representative of Canada. It was he who presented the Peace Treaty to the Canadian Parliament in the same year. In July, 1920, he tendered his resignation as Premier. In the following year he was elected President of the League of Nations Society of Canada and was

Marfleet Foundation Lecturer at the University of Toronto. In 1921-22, he represented Canada at the Washington Conference and signed many treaties in this capacity, among them, the treaty on limiting naval armaments, the four-power treaty relating to insular possessions and dominions in the Pacific Ocean, the treaty relating to the use of submarines and noxious gases in warfare, and treaties in regard to China.

BORDET, JULES (1870-). A Belgian pathologist and bacteriologist, born at Soignes. He graduated from the University of Brussels in 1892 and later became professor of bacteriology, parasitology, and epidemiology and president of the medical faculty there. In 1901 he was appointed head of the Brussels Pasteur Institute. He published two works on immunity, *Études sur l'Immunité* (1909) and *Traité de l'Immunité dans les Maladies Infectieuses* (1920). In 1919 he was awarded the Nobel Prize in medicine. Bordet has much to his credit, for in 1900-01 he discovered complement-fixation, with Gengou, bacterial hemolysis in 1898, and the bacillus of whooping-cough in 1906. His theory of immunization is far simpler than that of Ehrlich, and many regard him as the leading figure in serodiagnosis and immunization.

BORGLUM, GUTZON (JOHN GUTZON DE LA MONTHE) (1867-). An American sculptor (see VOL. III). His best known achievement was the planning and execution of the Stone Mountain (Ga.) memorial to the Confederacy. This is a gigantic bas-relief depicting in heroic proportions a group of Southern leaders (Lee, Davis, Stonewall Jackson, Johnston, Forrest and Stuart), in the midst of marching troops, cut out of the mountain, and being a quarter of a mile in length. The distance from the knee of Lee's horse to the General's hat is 120 feet. The site of the memorial was dedicated in May, 1919, but the work was not begun till 1922. General Lee's head was unveiled Jan. 18, 1924. A part of the plan is a memorial hall, cut into the mountain below the sculpture, 320 feet long, 40 feet high, and 78 feet deep. An important service to national art was the founding of the American School of Sculpture for practical instruction.

BORGLUM, SOLON (1868-1922). An American sculptor (see VOL. III). He made the equestrian statue, "The Pioneer," at the San Francisco Exposition (1915) and executed colossal portrait busts of generals of the Civil War (for the Vicksburg, Miss., National Park). He received the Croix de Guerre for services with the French army in the War and was active in educational work in the American Expeditionary Force in France. His most recent achievements include a group of 42 heroic figures in bronze, "Wars of America," for Newark, N. J.; a colossal bronze equestrian statue of General Sheridan for Chicago, and a monument to Governor Aycock, Raleigh, N. C.

BORI, LUCREZIA (1888-). A Spanish lyric soprano, born at Valencia. After six years of study under Vidal, in Paris, she completed her education in Milan and Rome. Her very successful début in Rome as Carmen (Oct. 31, 1908) led to engagements in Paris, Milan, Naples, and Buenos Aires. Her American début took place at the Metropolitan Opera House as the heroine in Puccini's *Manon Lescaut* (Nov. 11, 1912); she immediately established herself in favor. Her brilliant career really be-

ga. after her overwhelming success as Fiora in the American première of Montemezzi's *Amore dei Tre Rè* (Jan. 2, 1914). In the next year she was stricken with an affection of the throat which necessitated a serious operation and for some time it was feared that her career had been ended. Fortunately she not only recovered entirely, but after her illness her voice even gained in volume. She returned to the Metropolitan Opera House in 1921, where she continued as a regular member.

BORING, EDWIN GARRIGUES (1886-). An American experimental psychologist, born in Philadelphia. Originally destined for an engineering career, he took the degree of M.E. at Cornell University in 1908. Shortly afterward he became interested in the study of psychology. He was a member for more than 10 years of Professor Titchener's laboratory in which he served first as assistant and then as instructor (1913-18). From 1919 to 1922 he was professor of experimental psychology and director of the psychological laboratory at Clark University. In 1922 he became associate professor of psychology at Harvard University. Professor Boring's most important contribution has been in the field of cutaneous and organic sensations. He carried through the Head experiment in cutaneous nerve division and was able to challenge Head's theoretical conclusions as to the existence of two systems of nerve sensibility. In his systematic outlook Professor Boring followed the general introspective position of the Titchener school but was more favorably disposed toward the newer doctrines. See *PSYCHOLOGY, EXPERIMENTAL*.

BORIS III (1894-). The King of Bulgaria. He succeeded his father, King Ferdinand, on the latter's abdication, Oct. 4, 1918. King Boris was born at Sofia, the eldest son of King Ferdinand and Marie Louise de Bourbon. He was educated in Bulgaria by tutors and at the Cadet and Officers' School. Subsequently he was aide-de-camp to the King and several generals of the Bulgarian Army.

BORNEO. One of the largest islands in the world, situated in the East Indian Archipelago. It has an area of 283,900 square miles. Politically it is divided into: (1) British Borneo which is made up of the divisions, North Borneo, Brunei, and Sarawak, covering the northern portion of the island (total area, 77,100 square miles; total population, 832,637), and which is administered from the Straits Settlements (q.v.); (2) Dutch Borneo, covering the rest of the island, which is made up of the divisions, West Coast Borneo, and South and East Districts of Borneo (total area, 206,810 square miles; total population, 1,626,000), and which is administered from the Dutch East Indies (q.v.).

BORNSCHEIN, FRANZ CARL (1879-). An American violinist and composer, born at Baltimore. From 1895 to 1902 he studied at the Peabody Conservatory there with J. Van Huestein (violin) and O. B. Boise (composition). In 1905 he became violin instructor at that institution and director of the junior orchestra. In 1913 he was appointed conductor of the orchestra of the Baltimore Music School Settlement. From 1910 to 1913 he was music critic of the *Baltimore Evening Sun* and at various times was connected with other publications. He wrote three symphonic poems for orchestra, *The Sea-god's Daughter*, *A Hero's Espousal*,

The Rime of the Ancient Mariner; a suite, *The Phantom Canoe*; a ballad for baritone and orchestra, *The Djinns*; a violin concerto in G minor; a cantata for chorus and orchestra, *Onowa*; and some chamber music.

BOROWSKI, FELIX (1872-). An American composer, born at Burton, England. He began his musical education with his father, continued in London under A. Pollitzer (violin) and C. W. Pearce (composition), and in 1888 entered the Cologne Conservatory, where he was a pupil of G. Jensen (composition), E. Hauser (piano), and G. Japha (violin). Having taught for some time at Aberdeen, he settled in 1894 in London and devoted himself to composition. In 1897 he became professor of theory and composition at the Chicago Musical College and in 1916 was elected its director. From 1906 to 1909 he was critic of the *Chicago Evening Post*, and from 1909 to 1918 he filled a similar position on the *Record-Herald*. After 1908 he wrote the programme-books for the Chicago Symphony Orchestra. His compositions include a ballet-pantomime, *Boudour* (Chicago, 1919); three symphonic poems, *Eugen Onegin*, *Printemps Passionné*, *Youth* (North Shore Festival prize, 1923); *Valse Pathétique*, *Marche Triomphale*, *Ecce Homo*, *Élégie Symphonique*, *Trois Peintures*, for orchestra; a piano concerto in D minor; *Crépuscule* and *Serenade* for string orchestra; *Allegro de Concert* for organ and orchestra; a string quartet in A minor, a suite and two sonatas for organ; and pieces for violin and piano and for piano solo (*Sonata russe*, etc.).

BOSANQUET, BERNARD (1848-1923). A British philosopher. His death in February, 1923, came at the height of his creative activity. His last book, left unfinished, has been published posthumously by his widow, under the title *Three Chapters on the Nature of Mind* (1923). The works written since the War belong to the third period of his work, when he was defending the conception of the absolute. These include *The Meeting of Extremes in Contemporary Philosophy* (1921), *Implication and Linear Inference* (1920), *Life and the Individual* (Processes of the Aristotelian Society, 1918), and *Some Suggestions as to Ethics* (1918). Taken together with the Gifford Lectures of 1911-12 (*The Value and Destiny of the Individual*), they may be regarded as constituting a bulwark against the tide of easy-going philosophies of sentiment to which the modern mind is peculiarly inclined. In *Contemporary Philosophy* he pointed out how Italian neo-idealism (Gentile and Croce) and British neo-realism (Alexander) converge at one focus after starting from diametrically opposite directions.

"You cannot," he wrote, "cut down the universe to the creative work of constructive thinking on the one hand, nor to the real world of the context of our waking bodies on the other. The narrowness and recognitions of neo-idealists and of neo-realists balance one another and amplify our conception of the whole." See *ÆSTHETICS*.

BOSHER, KATE LANGLEY ("KATE CAIRNS") (1865-). An American author (see Vol. III). She wrote *How It Happened* (1914), *People Like That* (1915), *Kitty Canary* (1917), and *His Friend, Miss McFarlane* (1918).

BOSNIA-HERZEGOVINA. Up to November, 1918, this land continued a territory of

Austria-Hungary and was administered from the Dual Monarchy's Ministry of Finance. (It has an area of 19,768 square miles, and a population, in 1920, of 1,899,929, as compared with the 1910 population of 1,895,044.) On Nov. 1, 1918, the Diet constituted itself a national government and took over the administration of the territory; the formation of Jugo-Slavia found Bosnia-Herzegovina a constituent province.

BOSPORUS STRAITS. See DARDANELLES AND BOSPORUS STRAITS.

BOSS, BENJAMIN (1880-) An American astronomer, born at Albany, N. Y. He was graduated at Harvard in 1901 and at once became an assistant at the Dudley Observatory in Albany. In 1905 he became connected with the United States Naval Observatory in Washington, and during 1906-08 he was in charge of the Naval Observatory at Tutuila in Samoa, where he made important observations of Newcomb's fundamental stars. On his return to the United States in 1908 he became secretary of the department of Meridian Astronomy of the Carnegie Institution, of which work he became director in 1915. In that year he returned to Albany, where he was called to the directorship of the Dudley Observatory, in succession to his father. His scientific work has had to do principally with the determination of the star positions and motions. He was a member of the total eclipse expedition to Flint Island in 1908 and became editor of the *Astronomical Journal* in the same year.

BOSSANGE, EDWARD RAYMOND (1871-). An American architect, born at Enghein in France. He was brought to the United States when nine years old and was educated at Columbia University and at studios in New York and Rome. He was connected at various times with Ernest Flagg, Carrere and Hastings, and Warren and Whitmore; he was also a member of the firm of Bossange and Newton. From 1913 to 1915 he was professor of architecture in Cornell University and in the latter year became a member of the faculty of the Carnegie Institute of Technology, where he was director of the College of Fine Arts (1918-).

BOSTON. The capital of Massachusetts and the commercial metropolis of New England. The population rose from 686,092 in 1910 to 748,060 in 1920 and to 776,683 by estimate of the Bureau of the Census for 1924. The metropolitan district, including territory within 10 miles of the city boundaries, had a population of 1,772,254 in 1920. During the War, Boston shipping and port facilities expanded rapidly. Extensive plans for terminal and dock warehouses were made in 1918, and in 1919 a drydock, the largest in the United States, which had been begun by the State of Massachusetts before the War, was purchased by the United States Navy Department and completed. It was 1176 feet long and 149 feet wide and cost over \$3,000,000. In 1922 the Boston airport was established. The Legislature made an appropriation for the airport and leased the land in East Boston for use as a landing field for \$1 a year. Additional money was raised by private subscriptions to complete the construction and equipment of the field. It was leased by the United States army for military purposes, on condition that commercial flyers were to be allowed full use of the field. Two new subways begun in 1912 were opened during the

decade. The East Boston extension opened in 1916 was .41 miles long and cost \$2,287,000 to construct; the Dorchester tunnel completed in 1918 at a cost of \$10,582,000 was 2.26 miles in length. A second section of the Museum of Fine Arts was opened in 1915 and the State House was enlarged by the addition of east and west wings in 1919, at a cost of approximately \$3,000,000. In 1922-3 the State Legislature authorized a new two-mile northern gateway to give the towns to the north and east of Boston better access to the city. Downtown traffic was to be given more elbow room by the widening of Kneeland and Tremont Streets; by widening Cambridge and Court Streets, a new direct thoroughfare was to be provided in and out of the congested district.

Within the city itself, the most notable development of the decade in the park system was the cutting through of the Strandway in South Boston and Dorchester, along the shore of Dorchester Bay. This great improvement ran perhaps six miles almost from City Point to Neponset. Between the park roadway and the water was a continuous beach varying in width from about 50 to 500 feet. Along this, various public conveniences including bath and boat houses and playgrounds, baseball fields, athletic fields, etc., were arranged. Under the will of George E. White, something over \$7,000,000 was left as a fund almost without restrictions for the general public welfare of the city. It was administered by a board of five trustees, including three city officials, so that the use of the fund is such as to make it practically a part of the municipal finances of the community. The Board of Trustees up to 1924 devoted the income from the fund almost entirely to public health work, including the establishment of health centres in congested districts. In 1919 the Metropolitan Parks Board, the Metropolitan Sewer Board and the Metropolitan Water Board were consolidated under the Metropolitan District Commission, and in 1923 the Legislature created a division of metropolitan planning, which began immediately to coordinate the activities of all the planning boards in the 39 cities and towns of the metropolitan district. The zoning law of the city itself was amended.

The exports of the city increased from \$71,963,879 in 1914 to \$221,728,343 in 1918, and to \$349,620,484 in 1923; imports rose from \$163,013,099 in 1914 to \$295,907,047 in 1918. After 1918 imports through the port of Boston did not continue to increase, owing in part to the fact that the ports to the south of New York had lower rates from the interior of the country. The imports that did come through Boston were very largely for the immediate use of the manufacturers in New England itself. Bank clearings increased from \$7,866,664,000 in 1914 to \$19,068,369,000 in 1923. Postal receipts in the Boston Postal District, one of the largest of the country in area, increased from \$3,209,414 in 1914 to \$13,817,716 in 1923. Manufacturing establishments in Boston in 1922 turned out a product valued at \$496,982,035 as against \$284,802,479 in 1914.

The police force of the city went on strike in 1919 to compel recognition by the city administration of the organization of their union and their right to affiliate with the American Federation of Labor. Order was restored and maintained by the State guard, and Calvin Coolidge,

then Governor of Massachusetts, also requested Federal aid in case of necessity, but no further disturbances occurred. On the third day the strikers offered to return to duty, but the city, declining to receive them, recruited a new police force at an increased wage scale.

BOSTON SYMPHONY ORCHESTRA. See Music, *Orchestras*.

BOSTON UNIVERSITY. A nonsectarian institution at Boston, Mass., founded in 1869. The student enrollment increased from 1827 in 1914 to 10,008, including evening and Saturday courses, in 1923-24, and 1082 in the summer session of 1923; the faculty was increased from 170 to 382 members; and the number of volumes in the library from approximately 43,000 to 92,134 volumes. The endowment was increased during the same period from \$2,367,820 to \$4,179,984, of which \$965,000 came by bequest in 1918 from Mrs. C. C. Corbin. In 1922, a campaign for \$4,500,000, called the Fiftieth Endowment Fund, was launched, of which approximately \$2,000,000 was pledged by June, 1923. President, Lemuel Herbert Murlin, D.D., LL.D.

BOSTWICK, ARTHUR ELMORE (1860-). An American librarian (see Vol. III). He was president of the Missouri Library Association in 1917 and of the publication board of the American Library Association, 1918-21. He is the author of *Earmarks of Literature* (1914), *The Making of an American's Library* (1915), *Library Essays* (1920), and *A Librarian's Open Shelf* (1920). He edited *Classics of American Librarianship*, 3 vols. (1915-21).

BOSWORTH, EDWARD INCREASE (1861-1927). An American theologian, born at Dundee, Ill., and educated at Oberlin College, Yale University, and the University of Leipzig. After a year as pastor of a congregational church in Mount Vernon, O., he joined the faculty of the Oberlin Graduate School of Theology, of which he became dean in 1892. He was acting president of Oberlin College, 1918-19. His works include *Studies in the Acts and Epistles* (1898); *Studies in the Life of Jesus Christ* (1904); *New Studies in Acts* (1908); *Commentary of Romans* (1919); and *What It Means to Be a Christian* (1923).

BOTANY. Investigators in all fields of botanical science were active in the period between 1914 and 1924, and the amount of literature turned out was very large. Without disparaging in any way investigations in other fields, only the more recent discoveries in a few lines can be noted here.

General. The address of Dr. William Bateson, "Evolutionary Faith and Modern Doubt," delivered before the American Association for the Advancement of Science at Toronto, Canada, in December, 1921, was seized upon by the foes of the theory of evolution as a repudiation of that doctrine. Later Dr. Bateson attempted to correct this impression by stating, "Though no one doubts the truth of evolution, we have as yet no satisfactory account of that particular part of the theory that is concerned with the origin of species in the strict sense." He was apparently considering the processes of variation and not the survival of variants after they have appeared. He did not consider with favor DeVries' Mutation Theory as an explanation of discontinuous variation.

A. L. and A. C. Hagedoorn offer an explanation of the origin of species based on the modern conception of the crossing and inbreeding of

species. According to their hypothesis the somatic characters possessed by any group of individuals capable of crossing are determined by the genes of the zygotes which produce them, and variation arises from the blending of genes that are not common to all the members of a group. This implies the influence of environment and Tansley thinks it is conceivable that genes may be altered or new ones created by the long continued influence of environment. Bonnier reports the changed character of mountain species when grown on lowlands and vice versa, and Rawson claims to have produced a double strain of poppy by change of environment. Anthony has produced definite strains of violets by constant asexual propagation. A review of the present day aspect of this subject was given by A. G. Tansley in an address before the botanical section of the British Association for the Advancement of Science, September, 1923.

The principles of serum diagnosis, so successfully applied for the recognition of certain diseases of man and domestic animals, have been applied to plants by a number of botanists to determine the relationship of families of plants, and Lange presented a phylogeny of the Ranales based on serum diagnosis and morphological studies. Similar work was in progress in which Nelson and Dworak were making use of globulins from plants to determine resistance to certain diseases, and no antibodies were formed when globulins from resistant plants were injected into experimental animals. Lipman and Taylor reported experiments indicating that wheat plants grown in culture solutions could assimilate nitrogen from the air. Several experimenters reported that certain green algae could utilize free nitrogen if they were furnished sufficient carbohydrates. These experiments appear to confirm the claim that the power of plants to assimilate free nitrogen from the air is not limited to leguminous plants. Bristol and Page, however, questioned the ability of green algae to assimilate free atmospheric nitrogen and claimed that when grown under control conditions no fixation of nitrogen took place with the species investigated, and the question was raised of a possible symbiosis between algae and nitrogen-fixing bacteria.

Loeb, MacDougal and others have devoted much study to colloids, gels, artificial cells, etc., in an attempt to determine the fundamental principles underlying certain plant activities. MacDougal has succeeded in producing an artificial cell that exhibits some of the physical activities of the living cell, and with it he has measured the swelling of biocolloids, and the reaction of certain colloids in the external layers of the cell to the surrounding medium was ascertained. The bearing of some of these studies is noted elsewhere.

Physiological studies. Among the studies of plant activity, photosynthesis, or the transformation of carbon dioxide and water vapor into carbohydrates under the influence of light, is one of the most attractive, as it is the connecting link between inorganic matter and organized life. Willstätter has shown that the green coloring matter in leaves is composed of two pigments, chlorophyll *a* and chlorophyll *b*, which are normally present in about the proportion of 72 per cent of the former and 28 per cent of the latter, and the greatest synthetic activity of the plant takes place when these proportions are maintained. Wlodek found that

chlorophyll *b* increases in leaves during the day and chlorophyll *a* during the night. Certain fertilizer constituents were also found to influence the ratio between the two forms of chlorophyll. A deficiency of potassium results in a decrease of *b* and an increase of *a*, while if the nitrogen balance is not maintained the opposite effect is produced on the chlorophylls. A deficiency of phosphorus reduces the normal fluctuation in the chlorophyll components. This shows conclusively the necessity of a proper balance of the nutrients available to a plant if normal vegetative activity is maintained.

It is generally asserted that photosynthesis is carried on by the chlorophyll in the chloroplasts, but this appears to be true in part only. Investigations of Irving, confirmed by Briggs, indicated that some other agency than chlorophyll takes part in photosynthesis. Willstätter and Stoll thought an enzymic factor was involved, and Spoehr claimed that the colorless components of the protoplasm of the chloroplasts exerted an important part in photosynthesis. Weinberg suggested that chlorophyll initiated the process of carbohydrate synthesis but that an enzyme was necessary to complete the transformation of the first product of photosynthesis. While carbon dioxide is generally obtained from the air, Pollacci showed that green plants deprived of supplies of carbon dioxide, except through their roots, were able to sustain growth for a considerable time. See CHEMISTRY, ORGANIC.

The commonly accepted theory of photosynthesis is that starch is the first visible product of such activity, but that formaldehyde is the first step in its synthesis. This appears to be confirmed by the chemical reaction of an aqueous solution of carbon dioxide when subjected to the action of ultra-violet light or in ordinary light in the presence of malachite green. Baly, Heilbron, and others demonstrated the formation of formaldehyde in this manner, and Heilbron claimed that photosynthesis was mainly the chemistry of the formation of formaldehyde and the synthesis of other products from it. On the other hand, neither Mazé, Maquenne, nor Molisch was able to find any trace of formaldehyde in living green leaves. Thunberg from chemical evidence deduced the hypothesis that in the assimilation of carbon dioxide by plants, sunlight decomposed water with the formation of hydrogen and hydrogen peroxide. The carbon dioxide reacts with the hydrogen and hydrogen peroxide to form methylene glycol which in turn is transformed into formaldehyde through the loss of a molecule of water. Weigert, discussing the above, believed that at a certain wave-length, radiant energy was transformed into chemical energy. Warburg considered heavy metals in the cells of plants acted as catalysts for the production of formaldehyde from carbon dioxide, and McHargue claimed this as one function for manganese in plants.

The theory of Bayer that formaldehyde is the first product of photosynthesis and that carbohydrates are derived by its condensation was rather generally accepted, but there was much doubt as to how the other products were formed. MacDougal did not believe that sugar can be formed by the simple condensation of formaldehyde. Hexoses were considered by Dixon and Mason the first sugars formed, while Davis believed saccharose was the first sugar produced in the process of photosynthesis, and that it was transformed into hexoses for transportation to

other parts of the plant. Siegfried claimed that carbon dioxide must combine with some amino acid and that carbamino acid enters into the photosynthetic process. This theory received support, but Spoehr and Locke subjected salts of carbamino acids to the light of quartz mercury lamps without observing a trace of formaldehyde, ammonia, or hydrogen peroxide. Priestly gave an account of the metabolism of fat which was inseparable from the growth of plants. He claimed fat was present not only in storage organs but also in all rapidly growing parts of plants as well as in assimilating tissues, and from its early appearance he concluded that fatty substances were synthesized in the light and were derived from carbohydrates. Illumination, temperature and carbon dioxide content of the air influence photosynthesis, and this led to the theory of Blackman on limiting factors. He claimed that a single factor determined the physiological activities of plants and where a number of factors were involved, the slowest acting one would determine the result. Harder rejected this claim and held that where two or more factors were involved the rate of assimilation would depend on the combined value of all the factors.

In 1920, Garner and Allard contributed a notable account of the action of light on plants, and they supplemented their report with additional data. By controlling the daily periods of illumination they were able to accelerate or retard growth and reproduction of a number of species of plants almost at will. Autumn-flowering plants were brought into flower in summer, biennials behaved as annuals, and annuals were retarded in their fructification. Some plants were forced out of their normal life cycle by reducing the period of daily illumination, others by increasing it. To this response of plants to the length of day the name *photoperiodism* has been given, that is, the length of day required to bring about fructification. Each species of plant is assumed to have an optimum light period for its growth and reproduction. As an indication of the effect of varying the period of illumination on plant development, tobacco plants that required from 152 to 162 days for flowering with 12 hours' illumination required but 55 to 61 days when the period was reduced to seven hours daily. It was also thought that diminishing the length of day had an influence in preparing perennial plants to enter into the condition preliminary to winter dormancy. It was believed that photoperiodism not only controlled the photosynthesis of plants but it in some way influenced the acidity relations, the form of carbohydrate in the plant, and also the water content of the tissues. Confirmative evidence of this hypothesis was found by McClelland in Porto Rico, where variation in the length of the day is not great, and by Wanser at Lind, Wash., where the difference between length of day and night is quite marked. Wanser claimed that by properly adjusting the daily illumination of wheat it was possible to cause heading irrespective of the time of year. On the other hand, Harvey reported having grown an extensive list of plants from germination to seed-bearing, the plants having been subjected to continual illumination of strong electric light throughout the entire period of growth. Setchell found eelgrass required a rather definite range of temperature for growth and reproduction, and that with this

plant there was no evidence of photoperiodism.

The reaction of the living cell to its surrounding medium was the subject of many investigations. Loeb gave much attention to a study of the conductivity of the cell, and he found that difference of potentiality within and without the cell was influenced by the reaction of the surrounding medium. He made a special study of proteins and found their relations to electrolytes had an important bearing on cell permeability. Osterhout claimed that the electrical resistance of the protoplasm could be taken as a measure of the permeability of the cell. He also believed that there was some mechanism within the cell that protected the contents against too great concentration of solutes within the cell. Boas thought it was the cell colloids that protected against injury due to concentrations of injurious substances.

Several investigators considered that an electrical stimulus changed the hydrogen-ion concentration within the cell, rendering the plasma membrane permeable. Nernst claimed that the excitation produced by the passage of an electric current through living tissues was due to changes in salt concentration produced at the surface of the plasma membrane, and that changes which influenced the hydrogen-ion concentration would also increase or diminish permeability. Narcotics generally reduce permeability through their reduction of the hydrogen-ion concentration. Applying the principles of colloidal chemistry to the study of his artificial cell, MacDougal claimed it was possible to measure accurately the osmotic action of cell contents, the amount of exosmose, and the loss of electrolytes from the immersion liquid.

The cause of the movement of water through the stems of plants continued undetermined, but additional evidence was offered to explain that phenomenon. It was repeatedly shown that living cells were not necessary for the upward movement of water in vegetable tissues. Renner, Steinbrinck, and others affirmed that the cohesion hypothesis was adequate to explain water conduction. Other investigators claimed there was a suction force exerted from above, and in partial support of this hypothesis Harris, Gortner, and Lawrence found there was an increased osmotic concentration in the leaf sap from lower to higher levels in trees and other tall growing plants. They also claimed there was a correlation between the habit of growth, environment, and osmotic pressure in plants. Ursprung and Blum considered that external conditions influenced the osmotic pressure in plants and that there was a daily as well as an annual periodicity in osmotic movement. In a later paper they claimed there was a suction pressure that draws water into the cells. Bose developed an instrument of great delicacy that was said to show the movement of sap, and from his experiments he developed the idea that there were pulsating cells throughout the length of the plant and that their pulsation gave rise to the conduction of sap even in the absence of root pressure and transpiration. Dixon, in an address before the Botanical Section of the British Association for the Advancement of Science in 1922, claimed that the transportation of organic substances to the growing points of plants takes place in the tracheæ. The dissolved substances fill the tracheæ and are moved by the forces set up by transpiration, the expansion of growing cells and root pressure.

The principles underlying plant growth received the attention of plant physiologists Mitscherlich applied a formula to plant growth that was based on the increase in dry weight under the influence of a number of variable factors. Blackman claimed that the growth of annual plants proceeded, in the early stages, at a compound interest rate, but his formula was challenged by a number of investigators. Loeb was responsible for what is called the inhibition hypothesis of plant growth. From his studies of *Bryophyllum* he claimed that apical growth in stems is accelerated and lateral growth retarded by the production of inhibitory substances in the stems. By the action of these substances the dominant buds are forced into growth and others are retarded. This idea received the support of Reed, Barker, Lees, and others, but the hypothesis was vigorously attacked by a number of investigators. Jones was reported to have found from his study of cuttings of plants that only a limited portion of the stem toward the root apex would produce roots. The opposite end tends to produce stems. It was impossible to change the area of root growth appreciably, but stem growth apparently is possessed by an extensive portion of the cutting. Short root cuttings were said to produce shoots from each end, but roots from one end only. In one of his last contributions on regeneration and growth, Loeb claimed that polarity in plant growth was determined by differences in the tissues which were reached by ascending and descending sap, and this determined shoot and root growth. Kraus and Kraybill in 1918 found a very definite correlation between the proportion of carbohydrates and nitrogen available to plants and their growth and fruitfulness. Reid, from a recent study of the regeneration of tomato cuttings, confirmed their conclusions. He claimed that when carbohydrate reserves were high, and available nitrogen, either within or without the plant, was low, there would be vigorous root development. When the relative percentage of nitrogen was increased, shoot growth was abundant.

Ecology. This comparatively new branch of botany had become by 1924 one of great activity. To provide an outlet for publications in this specialized field two journals were established, *Journal of Ecology* and *Ecology*. The field of ecology had not been definitely limited, but broadly it included the relation of the plant to its environment, plant associations, and plant distribution. The relation of the plant, or association of plants, to environment was the subject of many investigations, and numerous studies were published on the ecology of more or less restricted areas. It was generally recognized that vegetation usually reflects the character of the soil, moisture, temperature, etc., and correlations were established between plant associations and soil types that were useful in determining the agricultural value of large areas of land. This led to studies of soil acidity as influencing the occurrence and distribution of plants. Wherry brought together a mass of information which is considered to show that the peculiar floras of bogs, salt marshes, sand barrens, etc., were due to soil acidity, and he believed that soil acidity was of fundamental importance in controlling the distribution of native plants. As a convenient method for determining the soil reaction, the hydrogen-ion concentration of the soil solution

had come into common use, and many investigators reported on its value as an index to the dominant features of the vegetation of a soil type. Laboratory studies showed that a certain physiological balance of salts in solution was necessary for the normal growth of plants. Attempts to apply this same principle to plants growing in soils did not always give satisfactory results. Enough had been done in this respect to indicate that the hydrogen-ion concentration of a soil might be an important factor in plant growth. Truog considered it had an important bearing on the feeding power of plants and the relation of plant growth to soil acidity and alkalinity.

Olsen, from a study of the meadow and woodland plants of Denmark, concluded that the occurrence and distribution of plants under natural conditions varied with the reaction of the soil as expressed by their hydrogen-ion concentration. Kelley also claimed that soil acidity determined the flora of a soil type, and Atkins found many plants were restricted in their range by the hydrogen-ion concentration of their habitats. Similar claims were made by many other investigators. Experiments showed, however, that the plant itself might exert an influence on the medium in which it was grown. Rudolfs, Pantanelli, and many others demonstrated the reaction of plants to the medium, and the work of Hartzell, Pickering, and others showed the influence of one set of plants on the growth of a succeeding one. This may be due to the development of toxic substances in soils or by changing their chemical reaction. The question of soil acidity as an ecological factor was considered very complex by Tansley. Comber believed that soil acidity was due to the relation of calcium to weak bases such as aluminum and not to its ratio to potassium, sodium, and other metals. Salisbury considered the ratio of calcium to potassium and sodium as inadequate in determining the distribution of plants. Pearson and Priestly offered evidence regarding the basic ratio and plant distribution. Kurtz reasoned, from the occurrence of many species of plants in soils of widely differing reaction, that soil acidity could hardly be a dominant factor in plant distribution.

Possibly on account of the inherent difficulty associated with their study, there had not been as many contributions to the phenomena of root growth as in other lines. Coupin claimed that the root tip was the most important region of absorption and the root hairs played a minor rôle. Knudson found that root caps separated from their roots could retain their vitality for several months. Robbins was able to grow excised root tips of maize, peas, cotton, etc., in nutrient media for more than three months. Weaver believed that with few exceptions most plants were able to conform their roots to their habitat and that soil moisture is the determining factor in root distribution. Waterman considered nutrition, rather than physical factors of the soil, responsible for the behavior of roots in their substrata. Hatton claimed that plants had as distinctive types of roots as of aerial parts, and Barker and Spink worked out a classification of apple stocks based on root characters. Merkle found that many desert plants were provided with surface roots, which were designated as absorptive roots, and deeper ones, which are considered to function mainly as anchor roots. Cannon, Free, Livingston, and

others paid especial attention to the question of root aëration. Increasing the carbon dioxide in the soil beyond certain limits was said to have an injurious effect which was due not to the toxic effect of the carbon dioxide but to the lack of oxygen. Noyes found the injurious effect of treating soils with carbon dioxide was apparent for more than nine months. Cannon believed that a deficiency of oxygen in the soil is a limiting factor in the rate of root growth.

A subject of considerable importance in explaining the distribution of plants was the hypothesis of Willis, known as the age and area hypothesis. It was claimed that "the area occupied at any given time, in any given country, by any group of allied species depends upon the ages of the species of the group in that country." Willis considered plant distribution in the present era with respect to its broader outlines was governed, mainly, by the time factor, while the detailed distribution in the area was mainly dependent upon ecological factors. Ridley disagreed with this hypothesis and cited many widely distributed species, the distribution of which appeared not to be explained by the theory of their antiquity. Numerous local floras were studied by various authors and their conclusions in many instances were at variance with the age and area theory.

Plant breeding. There was great activity in theoretical and practical plant breeding during the past ten years. To provide an outlet for the numerous papers which give the results of investigations in plant and animal breeding, a number of special journals were established, among them *Hereditas*, *Genetica*, *Genetics*, *Journal of Genetics*, and *Journal of Heredity*. These and other publications contain many articles which are intended to interpret Mendel's Law and De Vries' Mutation Theory. Many types of inheritance were recognized that did not conform to the simple Mendelian formula, and Yves Delage predicted the downfall of Mendelism through the weight of the many accessory hypotheses that have been offered for certain cases of inheritance. There was much speculation regarding the cell constituents that carried the factors of inheritance. Mottier and others believed that the chondriosomes, granular rod-shaped bodies in the cytoplasm that multiply by division and are permanent organs in the cell, are concerned in the transmission of inherited characters. The more recent theory of Morgan that the chromosomes carry the factors of inheritance was more generally accepted. Each chromosome is considered as carrying a large number of genes, or unit factors, which are brought together by crossing with the production of new combinations, through which new varieties are secured.

In economic plant breeding work the question of sterility of hybrids is of great importance. Certain structural characters, as well as physiological incompatibilities, are recognized as having a bearing upon sterility, but the sterility of the hybrids is of such common occurrence that their frequent presence is expected by plant breeders. Sterility in plant hybrids may be due to impotent pollen, abortive ovules, or the failure of the germ cells to unite and fuse together. The latter appears to be frequently the cause of sterility in plant hybrids. Horticulturists have known for many years that certain varieties of apples, pears, plums, cherries, grapes, etc., are self-sterile, and that a compat-

ible variety should be introduced among the plantings if increased fruitfulness is desired. These observations have been repeatedly confirmed by carefully controlled experiments with many species of plants. Sterility in plant hybrids is generally attributed to lethal factors occurring among the genes, and a study of the combination of these and other factors has an important bearing on plant genetics. When one variety of plant is sterile, reciprocal crosses with it will behave alike and the factors for sterility are inherited according to Mendel's Law. Some of our most highly prized varieties of fruit are notoriously shy bearers, due to various causes, sterility among them. By the study of the several factors involved it is possible to lay a basis for proper interplanting of varieties to secure greater fruit production.

Another line of plant breeding investigation was that of producing varieties or strains of important crop plants immune or resistant to plant diseases. Unlike some diseases of man and animals, immunity to subsequent attack does not appear to be conferred on plants through the incidence of disease. While little is known as to what causes resistance to disease on the part of plants, it has been quite definitely established that in plant breeding resistance is dominant to susceptibility and the tendency of resistance can be inherited and probably increased by repeated crossing. There are now well established varieties of wheat that are resistant, or immune, to rust and smut; tobacco, to root rot; potatoes to black wart; sugar cane, to mosaic, cotton, to wilt; cowpeas, to nematodes; beans, to anthracnose; cabbage, to yellows; tomatoes, to wilt; etc. In connection with breeding experiments for resistance to disease the interesting discovery was made that of many of the fungi which cause disease there are strains that cannot be differentiated except by biologic tests, and many of the resistant varieties of crop plants may be susceptible to some strains of the fungus while highly resistant or even immune to other strains. More than thirty biologic strains of wheat rust have been described. Fortunately, as a rule, only a few of the strains occur in a given locality and some are limited by climatic and other factors that reduce the liability of their introduction, and the plant breeder must consider the strains that are prevalent in his locality when undertaking the production of resistant varieties.

Bud selection, as a means for increasing the productivity of plants propagated vegetatively, has received considerable attention. Shamel and others worked with citrus species, sugar cane, etc., and they claimed that increased productivity has been secured through the propagation of buds from selected, high-yielding parent plants. Emerson considered bud variation due to aberrant chromosomes, somatic mutation or vegetative segregation of plastids. A number of investigators attempted to duplicate the results reported with citrus, but Rawes claims that the bearing capacity of apple trees was not transmitted vegetatively, and Sax and Gowan found no evidence to support the hypothesis of variation in yield being transmitted through vegetative propagation.

Necrology. Among botanists of international repute who died during the decade 1914-24 were: F. Nobbe, L. Hiltner, P. Sorauer, W. Pfeffer, and S. Schwendener, in Germany; G. Cuboni and P. A. Saccardo, in Italy; L. Matruhot, E.

Prillieux, and G. Bonnier, in France; A. and C. DeCandolle, in Switzerland; I. Bayley Balfour, G. Massee, M. C. Cooke, and J. G. Baker, in England; V. I. Palladin in Russia; and J. T. Burrill, W. G. Farlow, G. L. Goodale, B. D. Halstead and G. F. Atkinson, in the United States.

Bibliography. Some recent books on phases of plant physiology, ecology and plant breeding are: W. R. G. Atkins, *Recent Researches in Plant Physiology* (London, 1916); N. Bernard, *Principes de Biologie Végétale* (Paris, 1921); J. C. Bose, *The Physiology of the Ascent of Sap and Life Movements of Plants* (London, 1923); F. O. Bower, *Botany of the Living Plant* (London, 1923); F. Czapek, *Biochemie der Pflanzen* (Jena, 1920); D. T. MacDougal, *Hydration and Growth* (Washington, 1920); H. Molisch, *Pflanzenphysiologie* (Berlin, 1917); M. W. Onslow, *Practical Plant Biochemistry* (Cambridge, 1920); V. I. Palladin, translated by B. E. Livingston, *Plant Physiology* (Philadelphia, 1923); R. W. Thatcher, *Chemistry of Plant Life* (New York, 1921); R. Willstätter and A. Stoll, *Untersuchungen über die Assimilation der Kohlensäure* (Berlin, 1918); F. E. Clements, *Plant Succession* (Washington, 1916), and *Plant Indicators* (Washington, 1920); B. E. Livingston and F. Shreve, *The Distribution of Vegetation in the United States as Related to Climatic Conditions* (Washington, 1921); A. G. Tansley, *Practical Plant Ecology* (London, 1923); J. E. Weaver, *Ecological Relations of Roots* (Washington, 1919); E. B. Babcock and R. E. Clausen, *Genetics* (New York, 1918); E. Baur, *Die Wissenschaftlichen Grundlagen der Pflanzenzüchtung* (Berlin, 1921); L. Blaringhem, *Les Problèmes de l'Hérédité* (Paris, 1920); E. M. East and D. F. Jones, *Inbreeding and Outbreeding* (Philadelphia, 1919); C. Fruwirth, *Handbuch der Landwirtschaftlichen Pflanzenzüchtung* (Berlin, 1923); G. S. Gager, *Heredity and Evolution in Plants* (Philadelphia, 1920); H. K. Hayes and R. J. Gerber, *Breeding Crop Plants* (New York, 1921); T. H. Morgan, *The Physical Basis of Heredity* (Philadelphia, 1919); and M. J. Sirks, *Handbook der Allgemeine Erbkunde* (The Hague, 1923). See PLANTS, DISEASES OF, HEREDITY; ZOÖLOGY.

BOTHA, LOUIS (1862-1919). A South African general and statesman (see Vol. III). With General Smuts, Botha worked heroically, at the outbreak of the War, in the interests of the British Empire. In spite of the fact that he was Premier, he took the field first against the de Wet rebels, whom he crushed, and then in the campaign against German Southwest Africa. He remained at the head of the government until his death, Aug. 28, 1919.

BOTTOMLEY, HORATIO WILLIAM (1860-). An English journalist. He was of humble parentage and had little education, but by dint of hard labor and a sedulous cultivation of the tastes of the popular majority, he made himself one of the most feared of Englishmen. He first engaged in stock promotions and thus grew interested in journalism, so that the year 1922 saw him one of the four or five leading English newspaper publishers. His periodical *John Bull* was sensational and violent, with an enormous following. During the War, he fanned hatred against Germans; in the years following the Armistice he singled out the United States for vilifications. In 1922 his career was cut short

In the Metropolitan Museum of Art, New York City

to the infinite relief of intelligent Englishmen, when he was found guilty of misusing the great funds subscribed to his private patriotic organizations. He was sentenced to penal servitude for seven years. He had been an M.P., 1906-12 and 1918-22.

BOTULISM, or BOTULINISM. Within the interval 1914-24, our knowledge of this affection progressed to an extent hardly credible in comparison with the period when it was first associated with sausage poisoning. Nearly the entire range of preserved food products has been under review and much is still obscure, especially in regard to the manner in which the bacillus gains access to the preserved foods. It has been found that home preserved food is much more likely to contain it than the factory product. The high heat of the canneries is ordinarily a guarantee of the purity of their products, but the expulsion of the air as a result of the heat, regarded as the cornerstone of successful food preservation, is no safeguard against the bacillus but rather a menace, since it thrives in the absence of air. Since the spores can resist a high degree of heat, there is the fear that they may not be entirely destroyed and comparative studies show that the bacillus in some articles like spinach is more resistant than in other media. The safeguard then must consist in a high and sustained application of heat more than sufficient to destroy all spores.

On the other hand, a certain concentration of sugar or salt in water is sufficient to render the bacillus helpless and no fear need be entertained of eating foods preserved in these media if the concentration is guaranteed. Numerous cases of botulism from preserved olives were found to be due to a concentration of less than 6 per cent of brine. The products of any of the great food-preserving factories may be regarded as safe enough, while some of the small, obscure canneries lack the requisite technical knowledge and equipment, thereby resembling the home kitchen. Of interest in connection with the treatment is the use of the aeroplane for transporting the botulus antitoxin from the source, when the poisoning occurs in an out-of-the-way locality. See also **VETERINARY MEDICINE.**

BOUCHARD, HENRI (1875-). A French sculptor, born at Dijon, the son of a joiner and woodcarver, who presided over his earliest artistic education. He studied at Dijon and at the Ecole des Beaux Arts in Paris, where he won the Prix de Rome in 1891. He was influenced by Rodin and early evinced a preference for labor subjects, such as the "Laborer in Repose" (1907), "Plowing in Burgundy" (Champs de Mars, Paris), "Accident to a Quarryman," "Man with Hoe," the bronze "Blacksmith" (Metropolitan Museum, New York City), "The Stevedore" (Luxembourg Museum, Paris), and "The Fishermen." His historical subjects, all Gothic, Charles the Bold (Brussels), "The Master Workman," and Claux Sluter (Dijon), are no less powerful and characteristic. In a very different vein is his light and charming bronze "Girl with a Gazelle" (Metropolitan Museum, New York City). His most famous achievement, done in collaboration with Paul Landowski, is the international monument to the Calvinist reformation, austere and sublime, built into the old wall of Geneva. The four great central figures, Farel, Calvin, Knox, and Beza, are by both artists, and those of the six

lay heroes, Oliver Cromwell, the Great Elector of Brandenburg, and Roger Williams are by Bouchard. He is a realist of great power but in no sense a literalist. His art is synthesized, architectonic, and adapted to the material used; it excels especially in rhythm.

BOUHÉLIER, SAINT-GEORGES DE (1876-). A French author, born at Reuil, Seine-et-Oise. His works constitute a satire on society. The best of his productions is *Le Carnaval des Enfants*, a three-act play, published in 1911. In most of his writings he shows a lack of a sense of propriety and often becomes vulgar and even sacrilegious. His works include *Discours sur la Mort de Narcisse, ou l'Impérieuse Métamorphose: Théorie de l'Amour* (1895); *L'Affaire Dreyfus; la Révolution en Marche* (1898); *La Route Noire* (1900); *La Tragédie du Nouveau Christ* (1901); *Histoire de Lucie, Fille Perdue et Criminelle* (1902); *Des Passions de l'Amour* (1904); *La Tragédie Royale* (1909); *La Romance de l'Homme*, poems (1912); and *La Vie d'une femme; Œdipe; La Tragédie de Tristan et Yseult* (1922-3).

BOULOGNE CONFERENCE. See **REPARATIONS.**

BOURDELLE, ANTOINE (1861-). A French sculptor, the foremost successor of Rodin, born at Montauban. Dominated by Gothic traditions, he studied chiefly at Paris, with Rodin, who esteemed him the most important of his followers. His art, however, differs widely from Rodin's, which is essentially pictorial, while Bourdelle's is architectural, essentially sculptural, and dependent on the material. Archaic Greek and Gothic sculpture are the chief influences in his art. His early works include charming studies of girls and young women. More recent productions are a monument to the defenders of Montauban (1902); "The Archer Heracles" (1909; replica in The Metropolitan Museum of New York City); the remarkable reliefs on the Théâtre des Elysées, Paris; monument to the Polish poet Mickiewicz (1917), apostle of Polish independence; monument to General Alvear in Buenos Aires (1915-17), with colossal equestrian statues and allegorical figures, two of which, "Force" and "Victory," have been pronounced the finest sculptures the War brought forth. His most recent productions are a superb madonna and child (1922), in the Gothic spirit, and a monument to the miners of Montceaux who fell in the War. His powerful portraits include busts of Beethoven (Luxembourg Museum), Rodin, Ingres, Anatole France (1919), and M. Simu (Bucharest), and figures of Carpeaux and Rodin at work.

BOURGEOIS, LÉON VICTOR AUGUSTE (1851-1925). A French politician (see Vol. III). He was elected president of the Senate in 1918. In 1919 he became the French member of the League of Nations Commission and did important work in the drafting of the Covenant. On Oct. 14, 1919, he was named first French representative on the League Council. In January, 1923, he was reelected president of the Senate, but resigned shortly afterward to devote the remainder of his life to the advocacy of the League idea. This phase of his career resembled those of the English Lord Robert Cecil and the American ex-Supreme Court Justice John H. Clarke.

BOURGET, PAUL (1852-). A French novelist and critic (see Vol. III). His works

published after 1914 include *Le sens de la Mort* (1915), *Lazarine* (1917), *Némésis* (1918), *Anomales* (1920), *Laurence Albain* (1920), *L'Écuyère* (1921), all novels; and a travel sketch, *Le Démon du Midi* (1914).

BOURNE, RANDOLPH (SILLIMAN) (1886-1918). An American author, born at Bloomfield, N. J., and graduated at Columbia University in 1913, where he obtained a traveling scholarship. He studied in London and Paris (1913-14). Essays which had appeared in the *Atlantic Monthly* and other papers were collected in *Youth and Life* (1913). He was a well known contributor to the leading American magazines and was a member of the staff of the *New Republic* at its inception in 1914; later he wrote for *The Seven Arts* (1917) and the *Dial*, with which he was connected at the time of his death. His point of view was radical and always expressed with pointed style. His bitter opposition to the War, due rather to a high valuation of personality and freedom than to doctrinaire pacifism, was the core of the posthumous *Untimely Papers*, edited by James Oppenheim. Of more general interest was the still later *History of a Literary Radical*, compiled by Van Wyck Brooks. Bourne's other volumes were *The Gary Schools* (1916) and *Education and Living* (1917). A somewhat sentimentalized picture of him is presented in Paul Rosenfeld's *Port of New York*.

BOUTROUX, ETIENNE EMILE MARIE (1845-1921). A French philosopher (see VOL. III), who, although much advanced in years when the War came, served the cause of his country by public addresses which combined patriotism with enlightened internationalism. These addresses, published in book or pamphlet form, include *Certitude et Vérité* (1915), *Philosophy and War* (1916), *The Relation between Thought and Action* (1918), and *L'Amérique dans la Guerre Mondiale* (1918).

BOVINE TUBERCULOSIS. See VETERINARY MEDICINE.

BOWDOIN COLLEGE. An institution for men at Brunswick, Me., founded in 1794. The student enrollment increased from 394 in 1914 to 497 in 1923-24 and the faculty from 29 to 34 members. The library was increased from 110,000 to 130,000 volumes and the productive endowment from \$2,312,552 to \$3,563,950. In 1920, the college offered new courses in philosophy, government, and the fine arts, and in 1921 discontinued the medical school. In the same year it reported a marked decrease in the number of students in the more humanistic studies, and an increase in the number of those specializing in chemistry and economics. William De Witt Hyde, D.D., died in 1917 and was succeeded in the presidency by Kenneth C. M. Sills, LL.D.

BOWIE, WILLIAM (1872-). An American engineer born at Annapolis Junction, Md., and educated at St. John's College, Trinity, and Lehigh. In 1895 he entered the United States Coast and Geodetic Survey, serving at first in the field, both in the United States and its colonial possessions, but in 1909 he became chief of the division of geodesy. During the War he served in the Corps of Engineers with the rank of major. He has represented the United States at various international geodetic conferences and congresses and was president of the section of geodesy of the Geodetic and Geophysical Union in 1919. His scientific researches have

had to do with the theory of isostasy and its applications to dynamic and structural geology.

BOWLES, FRANCIS TIFFANY (1858-1927). An American naval constructor (see VOL. III). He was assistant general manager of the United States Shipping Board from 1917 to 1919.

BOWLEY, ALBERT JESSE (1875-). An American army officer, born in Westminster, Cal. He graduated from the United States Military Academy in 1897 and was commissioned 2d lieutenant. He took part in the Spanish-American War and in campaigns in the Philippines. From 1901 to 1905 he was a professor in the United States Military Academy. He served again in the Philippines in 1910-11 and in the latter year was appointed military attaché to China. From 1915 to 1917 he did duty on the Mexican border. In the latter year he organized the 17th Field Artillery, and commanding it in France, participated in nearly all the important actions in which the American Army took part. In 1918 he was appointed commander of the 2d Field Artillery Brigade, 2d Division, and in the same year became Chief of Artillery, 6th Corps. From 1919 to 1920 he was on duty at the General Staff College. He was promoted to be brigadier-general in the national army in 1918 and in the regular army in 1921.

BOWMAN, ISAIAM (1878-). An American geographer (see VOL. III). In 1915 he became director of the American Geographical Society of New York, and later (1917) received the Bonaparte-Wyse gold medal of the Geographic Society of Paris, for his explorations and publications of South America. In 1918-19 he was chief territorial specialist of the American Commission to Negotiate Peace and became a member of the geographic committee of the National Research Council in 1920. He is author of *South America* (1915), *The Andes of Southern Peru* (1916), and *The New World—Problems in Political Geography* (1921). He was associate editor of the *Journal of Geography* in 1918-19 and editor in 1919-20. In 1916 he became associate editor of the *Geographical Review*.

BOXING. Professional boxing established itself as perhaps the most popular branch of commercialized sport during the period from 1914 to 1924. The craze for fistic combats, particularly of the heavyweight variety, became worldwide with the United States setting the pace in the number of important bouts held, in the huge crowds of spectators attracted and in the size of the purses paid the contestants. Great Britain, France, Ireland, Italy, the Argentine, Chile, Peru and even the nations of the Orient all witnessed an amazing advance in interest shown both in local boxing events and in the many international matches which took place.

Several world championship titles changed hands. In the heavyweight division Jack Johnson, the negro, was deposed by Jess Willard, who in turn bowed to the prowess of Jack Dempsey (q.v.). Dempsey successfully defended his honors on four different occasions between 1920 and 1923, his opponents being Bill Brennan, Georges Carpentier (q.v.), Tom Gibbons and Luis Firpo. The battle between Dempsey and Carpentier which was held at Jersey City, July 2, 1921, attracted a throng of more than 80,000 persons who paid \$1,626,580 for admissions. All former records both for crowds and gate receipts were broken. The Dempsey-Firpo bout at the

Polo Grounds, New York City, Sept. 14, 1923, drew a "gate" of \$1,188,822.

Another sensational boxer to make his appearance was Benny Leonard, world champion of the lightweight division. Leonard won his title in 1917 from Freddie Welsh, of England and successfully defended it against several challengers up to the beginning of 1924.

The holders of world championship titles in the classes other than the heavyweight and the lightweight are: middleweight, Harry Greb; welterweight, Mickey Walker; light heavyweight, Mike McTigue; featherweight, Johnny Dundee; bantamweight, Abe Goldstein; flyweight, Pancho Villa.

Boxing among amateurs and in the colleges thrived along with the professional "game" during 1915-1924. The Amateur Athletic Union of the United States and the various European amateur federations conducted their usual tournaments.

An intercollegiate boxing league was organized in the United States, comprising several of the institutions of the Eastern States, and there also were held a large number of dual boxing meets between college teams. In England the universities of Cambridge and Oxford took up the sport with much success.

BOYD, ERNEST (?-). An American critic and journalist, born in Ireland. He was educated in France, Germany, and Switzerland for the British Consular Service, which he entered in 1913. He soon after came to the United States, where his efforts in familiarizing Americans with modern movements in Irish and European literature gave him at once a place of prominence among the younger critics. His writings in the *American Mercury* and the *Bookman* on American literary types and his causeries, first in the New York *Evening Post* and then in the New York *Tribune* on Continental literary tendencies, were welcome contributions in the work of building up American critical standards. His writings include *Ireland's Literary Renaissance*, *The Contemporary Drama of Ireland*, and *Appreciations and Deprecations*.

BOYD, JAMES OSCAR (1874-). An American theologian, born at Rahway, N. J., and educated at New York University, the University of Erlangen, and Princeton. From 1907 to 1915 he was assistant professor of Oriental and Old Testament Literature in the Princeton Theological Seminary, and from then until 1921 pastor of the Presbyterian Church of the Redeemer in Paterson, N. J. In 1921 he was named secretary for Arabic for the American Bible Society. His works include *Ezekiel and the Modern Dating of the Pentateuch* (1908), and *Sin and Grace in the Koran* (1912). He edited the *Octateuch in Ethiopic* (1909) and *A Brief Bible History* (1922).

BOYLE, HUGH CHARLES (1873-). An American bishop, born at Johnstown, Pa., and educated at Saint Vincent's, Beatty, Pa. He was ordained to the Roman Catholic priesthood in 1898, and acted as assistant in Saint Aloysius' Church, Wilmerding, Pa., and later in Saint Paul's Cathedral, Pittsburgh. From 1916-21 he was pastor of Saint Mary Magdalene's Church, Homestead, Pa. In the latter year he was consecrated bishop of Pittsburgh.

BOYLE, JOHN J (1861-1917). An American sculptor, born in New York City, and educated at the Pennsylvania Academy of Fine

Arts in Philadelphia and at the Ecole des Beaux Arts, Paris. He was particularly successful as a sculptor of Indian figures and is chiefly known for his group portraits of them. "The Stone Age in North America," one of his best works, is in Fairmount Park, Philadelphia. Two other groups by Boyle are "The Alarm," exhibited in Lincoln Park, Chicago, and "The Savage Age" at the Panama-Pacific International Exposition. His work also included the seated "Franklin" in Philadelphia and the figures of "Bacon" and "Plato" in the Congressional Library at Washington, D. C. The ability of Boyle as a sculptor was recognized in his election as Associate to the National Academy in 1910 and to the executive council of the National Sculptors' Society.

BOYLESVE, RENÉ-MARIE-AUGUSTE (1867-1926). A French novelist, born at La Haye-Descartes, and educated at Poitiers, Tours, and the University of Paris, where he attended courses in a wide variety of subjects. In his early youth he had the ambition to become a poet, but the symbolist movement, which was then at its height, did not suit his bent, and he turned to novel-writing as his profession. He was received in the French Academy in 1919. That he is a careful observer of provincial life is shown in *La Bequée*, one of his best novels (1901). His work has striking diversity. He is realistic, poetical, ironic, humorous, tragic. His works include *Le Médecin des Dames de Néans* (1896), *Sainte-Marie-des-Fleurs* (1897), *Le Parfum des Iles Borromées* (1898), *Mademoiselle Cloque* (1899), *L'Enfant à la Balustrade* (1903), *Le Bel-Avenir* (1905), *Mon Amour* (1908), *Le Meilleur Ami* (1909), *La Jeune Fille bien Élevée* (1912), *Madeleine Jeune Femme* (1912), *Tu n'Es plus Rien* (1917); *Nymphes Dansants avec des Satyres*, short stories (1920); *La Dangereuse Jeune Homme* (1921), and *Elise* (1921). He has used the pseudonym "René Tardiveau."

BOYNTON, HENRY WALCOTT (1869-). An American author (see Vol. III). He was appointed a member of the *Bookman* staff in 1915, and from 1919 to 1921 was on the staff of the *Review*. In 1921 he identified himself with the *Independent* and the *Weekly Review*. He published an edition of Carlyle's *Essay on Burns* in 1922.

BOY SCOUTS OF AMERICA. A movement for character building and citizenship training in boys through a programme of work and play; organized in February, 1910, and incorporated by Act of Congress in June, 1918. The number of scouts increased from about 300,000 in 1910 to 445,700 in 1923 and the number of leaders from 11,500 to 141,878 in 1923. During the War the scouts did notable service selling 1,867,047 subscriptions amounting to \$278,744.650 in the Liberty Loan campaigns, and \$42,751,031 worth of War Savings Stamps. They also operated thousands of War gardens; worked on farms and in orchards, spread food conservation propaganda; located and reported to the Forestry Service nearly 21,000,000 board feet of standing black walnut timber; collected, at the request of the War Department, and under the Chemical Warfare Service, several tons of carbon material; performed confidential service for the Third Naval District; and co-operated with the Red Cross, the War Camp Community Service, the American Library As-

sociation, the Salvation Army, etc. After the War their activities in community service included cooperating with forestry departments in fighting and preventing forest fires, helping to conserve wild life, working on the national highways, planting trees, conducting clean-up and safety first campaigns, acting as traffic aids and fireman's aids, guarding dangerous crossings, etc. In 1920, the decennial of the movement in America, over 360 picked scouts and their leaders took part in the first International Boy Scouts' Jamboree held at Olympia, England, in which representatives of the organization in 23 nations came together. In 1924 a troop of 48 boys and leaders represented the Boy Scouts of America at the second International Jamboree held at Copenhagen. An international conference of scout leaders was also held in London in 1920 which was attended by the officials of the American organization. A second International Conference in Paris in 1922, and third in Copenhagen in 1924. The director of the department of education, and a group of former scouts, then students in Yale University, at the request of the American Committee for Devastated France, conducted a Boy Scout Camp at Compiègne, France, during the summers of 1920-1922 to give French scouts the benefit of the American programme, system, and equipment, and to help them to organize their own camps. Biennial conferences of scout executives were held in 1920, 1922 and 1924. *Boys' Life*, the official magazine of the organization, adopted a widely extended programme in 1923 on receipt of a gift of \$100,000 from the Laura Spellman Rockefeller Foundation Fund. Through this gift the editors were enabled to raise the magazine to a standard hitherto impossible. They announced that they would seek to combat the objectionable type of story by giving the boys the sort of reading they wanted with objectionable matter left out. A total of 33 gold, 140 silver, and 423 bronze medals, and 336 Certificates for Heroism were awarded to scouts for conspicuous acts of courage and efficiency in saving life.

The number of merit badge pamphlets was increased to 70, providing vocational and general training by experts at a low cost. Thirty editions of the *Handbook for Boys*, totaling over 2,200,000 copies were issued, and in 1924 the *Handbook for Scoutmasters* was in its 5th imprint. Great progress was made in training scout leaders. A home study course was conducted in cooperation with Columbia University. In 1923, 350 local councils gave training courses which were attended by more than 8000 men. About 100 colleges, normal schools and theological seminaries included courses in scout leadership in their curriculum. Courses for scout executives were conducted at Columbia, Yale and other universities and in connection with regional conferences, to the number of 12. A bureau of church relations was established to promote coöperation with the churches.

In 1923, there were 2700 fully organized and equipped scout camps, during the summer 225,000 scouts spent one to three weeks in camp at an average cost to each boy of \$6.87 a week. Minimum standards of safety and sanitation were adopted and a certificate is issued to each camp.

New Seascout requirements were adopted,

and a revision of the Seascout manual undertaken. See also LONE SCOUTS.

BRADFORD, GAMALIEL (1863-). An American author (see VOL. III). He has written *Confederate Portraits* (1914), *Union Portraits* (1916), *Portraits of Women* (1916), *A Naturalist of Souls* (1917), *Portraits of American Women* (1919); *A Prophet of Joy*, poem (1920); *Shadow Verses*, poems; *American Portraits, 1875-1900* (1921), *Damaged Souls* (1923), and *The Love of Samuel Pepys* (1924).

BRADLEY, FRANCIS HERBERT (1846-). A British philosopher, born at Glasbury, and educated at academies Cheltenham and Marlborough before going to Oxford in the late 1860's, just when the idealistic reaction had set in against the materialistic empiricism of Mill and Spencer. Mr. Bradley identified himself with the Oxford school of Neo-Hegelians, which in the 1870's counted such teachers as T. H. Green and John Caird. He developed a philosophy of monistic absolutism and for more than 40 years he served as a rallying centre for those who sought in philosophy something more than an echoing of the scientific commonplaces of the day.

An invalid for the greater part of his life, Mr. Bradley has published his few works in the spells between "intervals of compulsory idleness." *Presuppositions of Critical History* (1874) and *Ethical Studies* (1876) exhibit the earlier Bradley, whose idealism is not completely emancipated from a certain empiricism. The *Principles of Logic* (1883) was an epoch-making work; it was reprinted with a commentary and terminal essays after a lapse of 40 years (1922). Without doubt Mr. Bradley's greatest book is *Appearance and Reality* (1893; 2d ed., rev., 1902). Its thesis reflects that single intuition, the perception of which, in the words of Bergson, marks the greatness of a philosopher. That the Absolute is and is One, that it is over and above the qualification of personality, that finite existents have their degrees of reality and truth only by relation to the Absolute, and that the more anything is spiritual, so much the more is it veritably real—such a thesis involves the fusion of science and religion, and it is calculated therefore to shock the advocates both of modern science and traditional religion. Nevertheless the work of Mr. Bradley stood up under the attacks of the Anglo-American pragmatists, and after 30 years its influence was distinctly visible in the realistic system of Prof. Samuel Alexander.

The *Essays on Truth and Reality* (1924) constituted a somewhat unsuccessful effort to extend the criterion of the degrees of truth to the world of scientific fact and prediction. The great difficulty is that this notion is essentially mystical and religious, and that science, in its own sphere at least, has wanted to treat all facts with democratic equality.

BRADLEY, HAROLD CORNELIUS (1878-). An American chemist, born at Oakland, Cal. and educated at the Universities of California and Yale, where he was instructor of physiological chemistry in 1904-06 in the medical school. In 1906 he was called to Wisconsin, where in 1917 he attained full professional rank. In 1910 he became research director of the Woods Hole Marine Biological Laboratory. His original investigations have had to do with such subjects as the physiological chemistry of the

mollusks and the presence of various metals, such as copper and zinc, in marine mollusca, and manganese in fresh water mussels. He has also studied the chemistry of the human pancreatic juice and the specific nature of hemoglobins.

BRADY, ALICE (?-). An American actress and singer, daughter of William A. Brady (q.v.). She graduated from the Boston Conservatory of Music, where she was a pupil of Theodora Irvine, and made her professional debut under an assumed name in *The Balkan Princess* in 1911. Later she sang in Gilbert and Sullivan productions. She played Meg in *Little Women* with much success and appeared with John Barrymore in *A Thief for a Night*. During 1914 her best parts were in *Sylvia Runs Away* and *What Is Love?* She began to act for the motion pictures as well as the legitimate stage in 1914 and has appeared in many pictures. Her legitimate successes after 1918 include her playing in *Forever After*, in *Anna Ascends* (1920), *Drifting*, and *Zander the Great* (1923).

BRADY, WILLIAM A. (1863-). An American theatrical manager, born at San Francisco. He made his first stage appearance in that city in *The White Slave* in 1882. Six years later he started a repertory company which proved very successful. In 1896 he took over the management of the Manhattan Theatre and in 1911 built and opened the Playhouse with *Sauce for the Goose*. The most notable productions under his management were *Pretty Peggy*, *Foxy Grandpa*, *The Pit*, *The Law and the Man*, *Baby Mine*, *The Boss*, *Bunt Pulls the Strings*, *Clothes*, and *The Man and the Hour*. He has presented Grace George (Mrs. Brady), Robert Mantell, Holbrook Blinn, Cyril Scott and others. In 1917 he was appointed by President Wilson chairman of a commission to organize the motion picture industry to cooperate with the Committee on Public Information.

BRAGA, THEOPHILO (1850-1924). A Portuguese philologist and president of Portugal (see Vol. III). He edited and wrote the preface of *Portugal: an Anthology* by George Young (1916).

BRAGDON, CLAUDE (1866-). An American architect, born at Oberlin, Ohio, who has written many books and essays on architectural subjects and was interested in the theatre. He produced *Hamlet*, *Macbeth*, and *Cyrano de Bergerac* for Walter Hampden. His recent books include *A Primer of Higher Space (The Fourth Dimension)*; *Projective Ornament: Four-Dimensional Vistas* (1916); *Architecture and Democracy* (1918); *Oracle* (1921), etc.

BRAGG, SIR WILLIAM HENRY (1862-). A British physicist, educated at Cambridge. In Australia from 1886-1908 he was professor of physics in the University of Adelaide. He moved to England on his appointment as Cavendish professor of physics at the University of Leeds, 1909-15. Jointly with his son, William John Bragg (q.v.), he received the Nobel Prize in physics for 1915. Both shared in other honors for their pioneer work in the study of crystal structure by röntgen rays. In 1915 he took the chair of physics in the University of London. His chief writings are *Studies in Radioactivity* (1912), and *X-rays and Crystal Structure* (1915) written in conjunction with his son. He was knighted in 1920.

BRAGG, WILLIAM JOHN (1890-). A

British physicist, born in Adelaide, Australia, and educated at Cambridge. He was lecturer on natural sciences at Cambridge, 1914-19, but resigned to become professor of physics at the Victoria University, Manchester, in 1919. He was associated with his father in the authorship of *X-Rays and Crystal Structure* 1915, and shared the Nobel Prize for physics with him in the same year.

BRAILSFORD, HENRY NOEL (1873-). A British author and journalist, born at Mirfield, Yorks, England. He was educated at Glasgow University and taught there for a time; later he wrote for the *Manchester Guardian* and other newspapers. In 1897 he volunteered for service with the Greek Foreign Legion. He was editor of *The New Leader*, the British Socialist organ, and published *The Broom of the War-God*; *Macedonia* (1906); *Adventures in Prose*, essays; *The War of Steel and Gold* (1914); *A League of Nations* (1917); *Across the Blockade* (1919); *After the Peace* (1920), and *The Russian Workers' Republic* (1921).

BRAINARD, DAVID LEGGE (1856-). An American explorer and army officer (see Vol. III). In 1917 he became brigadier-general of the National Army, and the following year brigadier-general of the United States Army. He was retired in 1918.

BRAISTED, WILLIAM CLARENCE (1864-). An American naval surgeon, born at Toledo, Ohio, and educated at Michigan and Columbia Universities. After four years of hospital and private practice, he entered the United States navy as assistant surgeon and after successive promotions was retired in 1920 with the rank of rear admiral; he served as surgeon-general during 1914-20. Conspicuous in his career were service as medical representative of the United States navy department during the Russo-Japanese War and service as fleet surgeon of the Atlantic Squadron during 1912-14. While surgeon-general, he was a director of the Columbia Hospital for Women and a visitor of the Government Hospital for the Insane; also he was a member of the central committee and war relief board of the Red Cross. In September, 1921, he was called to the presidency of the Philadelphia College of Pharmacy and Science. He has received decorations for his services from Japan and Venezuela, while from his own government he received the Distinguished Service Medal for his work during the War. He is a member of many scientific societies, including the Association of Military Surgeons, of which he was president in 1912-13, and the American Medical Association, which he served as president in 1919-20. He was made a Fellow of the Royal College of Surgeons by the University of Edinburgh in 1919.

BRAND, CHARLES JOHN (1879-). An American agriculturalist and economist, born in Lac Qui Parie County, Minn. He graduated from the University of Minnesota in 1902 and in the year following was assistant curator of botany at the Field Museum of Chicago. From 1903 to 1919 he was in the service of the United States Department of Agriculture, in charge of investigation of grasses and cotton. He was chief of the Bureau of Markets from 1913 to 1919 and in the latter year became vice-president and general manager of the American Fruit Growers, Inc. He was a delegate to several scientific and agricultural conferences and

served on several important commissions during the War, besides being a member of the wool section of the War Industries Board. He wrote numerous bulletins, addresses, and papers on agriculture, and coöperative production, marketing, and distribution.

BRANDEGEE, FRANK BOSWORTH (1864-1924). An American politician (see VOL. III). He was reelected to the United States Senate in 1914 and again in 1920.

BRANDEIS, LOUIS DEMBITZ (1856-). An American jurist (see VOL. III) and Associate Justice of the Supreme Court of the United States, appointed in 1916. Prior to his elevation to the Federal bench Mr. Brandeis was prominent as a lawyer and reformer and took an active part in the Zionist movement and other matters relating to the Jews. He has written many articles on naval problems, railroads, trusts, and Zionism.

BRANDENBURG, ERICH (1868-). A German author, born in Stralsund. He studied law, then history, at the universities of Leipzig, Berlin, Göttingen, and Heidelberg, and became professor at Leipzig. From 1919 to 1920 he was rector of the Leipzig University. He is the author of *König Sigismund und Kurfürst Friedrich I von Brandenburg* (1891), *Die Gefangennahme Heinrichs von Braunschweig durch den Schmalkaldenbund* (1894), *Herzog Heinrich von Sachsen und die Religiösen Parteien im Reiche* (1896), *Martin Luthers Auffassung von Staat und der Gesellschaft* (1900), *Die Parlamentarische Obstruktion* (1904), *König Friedrich Wilhelms IV Briefwechsel mit Ludolf Camphausen 1848-51* (1905), *Die Entstehung des Weltstaatsensystems* (1907), *Der Eintritt der Sudstaaten in den Norddeutschen Bund* (1910), *Die Deutsche Revolution von 1848* (1911), *Deutsche Kriegsziele* (1917), *Martin Luther als Vorkämpfer Deutschen Geistes* (1917), *Wie Gestalten Wir Unsere Reichsverfassung* (1919), *Die Naturalistische Geschichtsauffassung: Ihr Wesen und Ihre Wandlungen* (1920), etc.

BRANDENBURG, HANS (1885-). A German author and playwright, born in Barmen. He has written verse and fiction and is a student of modern drama and the dance. His books include, in poetry, *In Jugend und Sonne* (1904), *Einsamkeiten* (1906), *Gesang über den Saaten* (1912), *Italianische Elegien* (1914), *Die Ewigen Stimmen* (1921); the novels, *Erich Westenkott* (1896), *Chloe, oder die Liebenden* (1909), *Das Zimmer der Jugend* (1920); and a volume of sketches, *Der Moderne Tanz*. He has also written *Das Theater und das Neue Deutschland* (1919).

BRANDES, GEORG (MORRIS COHEN) (1842-1927). A Danish critic (see VOL. III). One of the greatest sympathetic critics of literature whose chief concern is with the "wide currents of European thought" rather than with "any national achievement or question of formal aesthetics and technique." His most recent work is *Wolfgang Goethe*, 2 vols., translated by Allen W. Porterfield (1924). It is the assembling of many years' notes on the famous German and outlines the development of the famous man "from cell up."

BRANGWYN, FRANK (1867-). A British painter and etcher (see VOL. III). His eight superb mural paintings for the Court of the Ages at the Panama-Pacific Exposition at San Francisco (1915) were masterpieces of

color and composition, which brought him also the important commission for the mural decoration of the Missouri State Capitol.

BRANSON, EDWIN BAYER (1877-). An American geologist, born at Belleville, Kan., and educated at the University of Kansas. He won a fellowship at the University of Chicago. In 1905 he became an instructor in geology at Oberlin and four years later was advanced to full professorship. He went to the University of Missouri as professor and head of the geological department in 1910. He devoted much attention to Devonian, Mississippian, and Pennsylvanian stratigraphy as well as to the geology of Missouri, and is an accepted authority on palæozoic fishes and Triassic amphibians.

BRANTING, HJALMAR (1860-1925). A Swedish statesman who first studied astronomy, devoting himself for a time to scientific work in the observatory of Stockholm. He then entered politics as a member of a small group of Social Democrats in Sweden. By his control of the weekly journal *Socialdemokraten* (1886), he spread his social doctrines, and for his articles in that publication he was imprisoned in 1888. In 1896 he was a member of the Second Chamber of the Riksdag. By his oratorical ability and as a leader of an increasingly powerful party, Branting rose to a position of national influence. In 1917 he became finance minister of the Eden government, and when that ministry fell in 1920 he was the head of a Social Democratic administration which, however, resigned in the same year. During the War and afterward, Branting took keen interest in all Social Democratic activities. He was representative of Swedish Social Democracy at the First International Congress. In 1917 he was chairman of the Dutch-Scandinavian delegation at Stockholm, and two years later, chairman of the International Social Democratic Conference in Berne. In addition he was a member of the executive committee of the Second International. In 1920 he was the member who introduced the question of "democracy and dictatorship" which terminated in a solid majority vote disapproving the Bolsheviks and their régime.

At the Council of the League of Nations in September, 1922, and at Geneva in July, 1921, as Sweden's leading delegate, he took up the cause of the inhabitants of the Åland Islands. In December, 1920, he was Sweden's leading delegate at the meeting of the League of Nations at Geneva and was on the sixth commission to settle questions of disarmament, etc.

BRAUN, HEINRICH (1854-). A German Social Democratic politician and writer on social questions. He edited the important socialist publications, *Neue Zeit*, *Archiv für Soziale Gesetzgebung und Verwaltung*, *Die Neue Gesellschaft*, and *Annalen für Sozialpolitik und Gesetzgebung*. He was minister for agriculture in the Prussian government under the presidency of Hirsch (1919). His wife, a famous writer and pamphleteer on feminism and socialism, was the daughter of General von Kretschman, an East Prussian Junker. See BRAUN, LILY.

BRAUN, LILY (1865-1916). A German writer, a feminist and socialist, who kept aloof from party activities. She was born in Halberstadt. Her grandmother was Jenny von Gustedt, an illegitimate daughter of Jerome Bonaparte and a prominent figure in old Weimar.

Her father was General von Kretschmann, whose *Kriegsbriege*, 1870-71, she edited. She married Prof. Georg von Gizycki, a leader in the Ethical Culture movement of Germany, and after his death Dr. Heinrich Braun, a sociologist and editor of the *Neue Gesellschaft*, a magazine of great merit but short life. Among her works are *Die Frauenfrage* (1901); *Im Schatten der Titanen*, a novel based on the life of Jenny von Gustedt (1908); *Memoren einer Sozialistin*, two volumes of autobiography (1909-11); *Die Liebesbriefe der Marquise* (1912); *Mutter Maria*, a tragedy (1913); *Lebenssucher*, a novel (1914); and *Die Frauen und der Krieg* (1915). She died at Berlin in 1916.

BRAUN, OTTO (1897-1918). A German writer whose one posthumous volume gave him a place in literature. He was the son of Dr. Heinrich Braun and Lily Braun (q. v.) and received his education mainly from private tutors. Although only 16 at the outbreak of the War, he enlisted and served first on the eastern, then on the western front, where he fell in April, 1918. The diary, begun at the age of 10 and containing letters and poems, among them *Eros and Psyche*, and five scenes on motives from Apuleius, was published by a friend of his mother, Julie von Vogelstein, under the title *Aus den Nachgelassenen Schriften eines Frühvollendeten* (1920), and appeared in an English translation as *The Diary of Otto Braun* (1924).

BRAUNFELS, WALTER (1882-). A German composer, born at Frankfurt, where he studied with I. Kwart and then with Leschetizky and Navratil in Vienna. After further study with L. Thuille in Munich he settled there in 1903, devoting himself entirely to composition. His works show decidedly futuristic tendencies. He wrote the operas *Prinzessin Brambilla* (Stuttgart, 1909), *Uhlen Spiegel* (1913), and *Die Vogel* (Munich, 1920); *Ariels Gesang und Serenade* for small orchestra; *Phantastische Erscheinung eines Themas von H. Berlioz* for full orchestra; *Revelation*, for tenor solo, chorus, and orchestra; songs for baritone and orchestra; a piano concerto, and piano pieces and songs.

BRAWLEY, BENJAMIN GRIFFITH (1882-). An American clergyman and author, born at Columbia, S. C., and educated at the Atlanta Baptist College, the University of Chicago, and Harvard University. He taught English in the Atlanta Baptist College (Morehouse College) and in Howard University, 1902-20. In 1921 he became pastor of the Messiah Baptist Church of Brockton, Mass. Among his publications are *A Short History of the American Negro* (1913; rev. ed., 1919); *The Negro in Literature and Art* (1918); *Women of Achievement* (1919); *A Social History of the American Negro* (1921); *A Short History of the English Drama* (1921); and *Early Effort for Industrial Education*, a brochure (1923).

BRAY, FRANK CHAPIN (1866-). An American editor (see VOL. III). He was associate editor of *Current Opinion* from 1914 to 1916. In 1919 he was editorial secretary of the World's Court League and editor of the *League of Nations Magazine*, and became in the next year a member on the editorial staff of the *Literary Digest*.

BRAY, WILLIAM CROWELL (1879-). An American chemist, born at Wingham, Ont. He

was graduated in 1902 at Toronto, where he became an Exhibition Scholar, and then studied chemistry in Leipzig. Returning to the United States, he became a research associate in physical chemistry at the Massachusetts Institute of Technology and in 1910 was made an assistant professor. In 1912 he was called to California, where in 1918 he became full professor of chemistry. During the War he served with the Chemical Warfare Service in Washington (1918) and as associate director (1919) of the fixed nitrogen research laboratory. His original investigations have had to do with qualitative analysis, ionization, and the halogens, on which subjects he has published papers in the *Journal of the American Chemical Society*.

BRAZIL. The largest country on the continent of South America, with an area of 3,275,358 square miles, and a population (census of 1920) of 30,635,605. This was a gain of 13,317,049 over the last official census year (1900), or an average annual increase of 3.84 per cent. The average annual increase for the period 1890-1900 had been 2.12 per cent. The density of population increased from 5.2 in 1900 to 9.3 in 1920. The populations of the largest cities were: Rio de Janeiro, 1,157,873; São Paulo, 579,033; Bahia, 283,422; Pernambuco, 238,843; Pará, 236,402; Porto Alegre, 179,263. The steady flow of immigration, which with 1911 began to assume increasing proportions, was checked by the War, but with 1920 once more took on importance. Between 1820 and 1920, 3,647,301 immigrants entered the country, of which 30 per cent entered during the years 1908-20 alone. The greatest single year was that of 1913, when 192,683 reached Brazilian ports. In 1923, there were 86,767 immigrants distributed by nationalities as follows: Portuguese, 31,866; Italians, 15,839; Spaniards, 10,141; Germans 8254. With the conclusion of hostilities, the government applied itself once more to the stimulation of immigration and offered agricultural laborers every facility to induce settlement in the federal colonies. In 1922, it was reported that these federal colonies had a population of 44,459. Japanese laborers were admitted into São Paulo at the rate of 5000 a year.

Agriculture. Only a small fraction of Brazil's soil has yet been brought under cultivation. In 1921, this area was 23,938 square miles distributed among the following states: São Paulo, 8277 square miles; Rio Grande do Sul, 4513; Minas, 4248; rest, 6900. There were 650,000 proprietors of land by the census of 1920. Coffee continued the leading crop, the annual average production remaining 12,000,000 bags (1 bag=132 pounds) because of regulations and restrictions. In 1923, the yield was 1,140,735 metric tons of which 882,426 were exported (724,818 in 1912). The 1922 sugar crop, raised chiefly in Rio de Janeiro and Pernambuco, was 826,400 tons of which 252,111 tons were exported (4772 in 1912). Cotton, grown chiefly in São Paulo, Ceará, Rio Grande do Norte, Parahyba, Pernambuco, Maranhão, and Sergipe, in 1923 amounted to 107,256,800 kilograms of which 19,169,584 kilograms were exported. Tobacco, cultivated in Bahia and Rio Grande do Sul, netted in 1923, 70,896 tons of which 36,536 tons were exported (24,706 in 1912). Cacao (cocoa) cultivated in Espírito Santo and Bahia, yielded in 1923, 65,329 tons and 51,963 tons were exported (30,492 in 1912).

Other important products with quantity exported for 1912 and 1923 were: maté (tea) 62,880 and 87,580 tons; rubber, 42,286 and 17,995 tons; hides, 36,255 and 57,798 tons. The packing industry, which was non-existent before the War, under the stimulation of American capital took on important proportions immediately, the export of frozen and chilled meats in 1923 being 76,829 tons. The exportation of pine, too, became an important factor in Brazilian commerce in recent years. Areas devoted to various purposes in 1923 were:

Products	Area Hectares	Per cent of total	Number of estab- lishments
Coffee and mining ..	45,657,927	26.0	243,304
Cattle and cereal ..	71,887,492	41.1	209,803
Sugar, cacao, cotton	33,075,521	18.9	155,349
Rubber and nuts ...	24,483,735	14.0	89,697

Mining. Gold and diamond industries were steadily languishing, while the industrial ores, under spur of foreign capital, made considerable strides. Manganese ore, mica, and monazite sand showed the greatest improvements. Of the first, 154,870 tons were exported in 1912, and 235,831 tons in 1923. The mineral exports in 1913 were valued at \$3,412,950, while in 1923 they were worth only \$4,578,000. Coal, heretofore a negligible factor, began by 1920 to play a serious part so that in 1923 it was estimated that domestic coal (about 400,000 tons in 1923) was supplying one-third of the local needs.

Manufacturing. Cotton mills continued to occupy the leading place in Brazilian home industries, the mills increasing from 194 with 761,816 spindles in 1910 to 357 mills with 1,700,000 spindles in 1923. This native industry supplied about three-fourths of the local textile needs. Other indigenous industries showing gains were the tobacco, sugar-refining, and shoe manufactures. During the period, iron and steel manufacturing grew steadily so that by 1923, 70,000 metric tons were being produced annually. Pig iron was being turned out in Minas Geraes, and steel bars in São Paulo. By the census of 1920 there were 11,335 factories employing 151,841 hands, with an investment of 665,676,000 milreis and an output valued annually at 741,536,000 milreis. Under the stimulation of a high protective tariff such artificial industries as brewing, flour milling, tanning, etc., were being developed.

Commerce. The end of the War saw Brazil's foreign trade steadily mounting, the 1920 total value of exports and imports being \$845,469,578 as compared with \$539,285,040 in 1910. The adverse conditions following 1920 brought the 1923 total down to \$565,585,666. The exports for almost every year during the decade showed a favorable balance for Brazil, that for 1919 being the largest in its history (\$211,115,204). In 1923, it was \$103,326,092. However, the factors of invisible exchange offsetting this were considerable. These included the country's external indebtedness, the earnings of foreign capital invested in the country (British investments, \$500,000,000; French, \$100,000,000; American, \$10,000,000), personal remittances of foreign residents, particularly Italians and Portuguese, expenditures abroad of Brazilian tourists and students so that there existed for the year 1923 an adverse balance of foreign payments of nearly \$35,000,000. The United States during

the War stepped to the forefront as the leading factor in Brazilian foreign commerce and thus for the first time dislodged Great Britain from its commanding position, only to lose it again, however, in 1922. In 1923 and 1917, the United States sent 16 and 47.25 per cent of the Brazilian imports and received 33 and 44.68 per cent of her exports. In 1920 and 1923, these figures were: imports, 42.1 and 20 per cent; exports, 41.38 and 43 per cent. In 1923, Great Britain took 11 per cent of Brazil's exports and sent 24 per cent of the imports. Other countries participating were Argentina, France, Portugal, Italy, India, Uruguay, Germany. Leading imports were iron and steel products, wheat and wheat flour, machinery, petroleum, hardware, automobiles, chemicals, cod-fish, coal. From a merchant navy of 238 steamers of 130,582 tons in 1911, ships flying Brazilian flags increased to 1419 steamers of 598,261 tons in 1919. The Brazilian Lloyd Company, formed of German vessels seized by the government on its declaration of war, established a regular service between Rio de Janeiro and New York and also with Liverpool and Portugal. In 1922, 25,264 vessels of 27,459,975 tons entered Brazilian ports as compared with 17,072 vessels of 12,927,000 tons in 1905.

Communications. In 1923, 18,554 miles of railway were open for traffic as compared with 13,848 miles in 1911. The individual states possessing the greatest mileage were São Paulo, 4160 miles; Minas Geraes, 4139 miles; Rio de Janeiro and Federal District, 2657 miles; Rio Grande do Sul, 1708 miles; Pernambuco, 1300 miles. During the period construction went on in the interior, a line in 1916 being completed from Itapura to Porto Esperança (State of Matto Grosso). In 1921, a third line into Matto Grosso was projected for the purpose of eventually tapping the rich Madeira country. It was planned to run it from Agua Clara to Cuyaba. Another plan called for a railway from Paraguay to São Paulo to divert the former's traffic from Buenos Aires. In 1919, there were 54,526 miles of telegraph line; 252,318 miles of telephone wires; in 1920, 3696 post-offices.

Finance. The national budget continued to show deficits in spite of heroic measures on the part of the government. The 1921 account showed a deficit of 56,011,364 paper milreis; for 1922, the deficit was 84,446,437 paper milreis; and the deficit in 1923 amounted to \$21,578,000. For 1923, the expenditures were 92,000,000 gold milreis and 997,000,000 paper milreis (59,248,045 gold and 443,952,452 paper in 1912); the revenues, 99,000,000 milreis gold and 743,000,000 paper (92,195,610 gold and 312,627,500 paper in 1912). On Dec. 31, 1923, the consolidated foreign debt was \$677,134,899. This total included £102,729,434, \$68,996,500, and 322,249,500 francs. The internal debt on Dec. 31, 1923, amounted to 1,514,481,300 paper milreis, and the floating debt on the same date amounted to 957,267 gold and 372,928,685 paper milreis. The total paper money in circulation on the above date was 2,643,192,867 milreis. The total public debt amounts to \$856,707,899. Average 1923 value of paper milreis was \$0.102 (normal value \$0.327).

Education. The advance in educational facilities was inconsiderable since attendance was not compulsory. There were, according to the latest reports, about 14,000 primary schools, 11 agricultural, and 9 commercial schools.

Courses in law, medicine, and engineering were given by 29 colleges. In 1920, the University of Rio de Janeiro was founded.

Defense. The total peace strength, based on compulsory military service, was, in 1921, 54,000; the complete mobilization force was placed at 120,000 men. The military expense was steadily cut, it being estimated that in 1922 the figure had become 45 per cent lower than that of 1913. No new dreadnoughts were laid down after 1907 but the government decided in 1921 to reorganize completely the navy under the supervision of American naval officers. A mission, headed by Commander Vogelgesang, was attached in an expert capacity to the Brazilian naval department. Dry docks at Rio de Janeiro and five naval stations on the coast were provided for in 1922. The *Rio de Janeiro*, dreadnought of 27,500 tons laid down in 1911, which Brazil failed to purchase and which saw service in the War under the British flag, was reported as sold to Brazil in 1921. This decision to continue the naval programme of 1906 was received with misgivings by Brazil's South American neighbors, Chile in particular protesting against steps that could end only in an armament-building race. See NAVIES OF THE WORLD.

Explorations. In 1914, Theodore Roosevelt, accompanied by a Brazilian party, made an exploring expedition down the River of Doubt, a tributary of the Madeira, which succeeded in confirming the existence of the hitherto questioned river. It was established that the river was 940 miles long. In honor of the explorer, Brazil named the body the Rio Roosevelt.

History. Brazil's internal history did not show the settled condition of her important neighbors and revolts continued to trouble her governments and distract attention from more important concerns. A rebellion that broke out in February, 1914, among the rubber collectors of Ceará reached alarming proportions and necessitated the intervention of the central government. Again, late in 1922, a revolt in the state of Rio Grande do Sul led to protracted fighting and it was not until June, 1923, that regular troops had the situation under control as a result of the capture of Alegrete, the stronghold of the revolutionists. There was a similar local uprising in São Paulo in July, 1924, which did not, however, attain serious proportions but which necessitated the intervention of Federal troops. The outbreak of the War affected Brazil's commercial stability seriously because of the country's dependence upon the European purchasing and money markets. The temporary falling off of imports and exports with an accompanying decline in customs receipts, the government's mainstay, led to the establishment of a moratorium for the redemption of foreign securities. Like other South American countries, Brazil naturally gravitated toward the United States, as the figures above given indicate, with the result that the trade record steadily mounted. Brazil, like the United States, was forced into the arms of the Allies by the German submarine campaign and the sinking of three Brazilian steamers. In May, 1917, Congress authorized the President to declare war at his pleasure and seize German interned vessels (about 45 in number). On Oct. 26, 1917, a state of war was declared and Brazil gave much material aid. Late in 1917, a new military act was promulgated providing for a draft army but this move came too late to

give any assistance on the battle fronts. As an ally Brazil was represented at the Peace Conference, took her place in the League of Nations and was elected a member of the Council. The "A. B. C." Entente of Argentina, Brazil, and Chile was cemented in May, 1915, by the signing of a treaty providing arbitral machinery in case of disputes. Discord did not appear until 1923, when Chile, aroused by Brazil's increased naval programme, brought up pointedly the question of disarmament. A meeting of the A. B. C. powers, preliminary to the annual Pan-American Conference, was held at Valparaiso in January, 1923; but here and at the Conference itself nothing was accomplished. The administration of Dr. Wenceslão Braz (1914-18) succeeded to some extent in cutting the national deficit though that factor always rose to trouble administrators. The success of his administration was due mostly to the great prosperity of the War period when Brazilian products were much in demand. He was followed for the next term by the former president, Sr. Alves, who died in 1919 without assuming office. In the special election following, Dr. Epitácio de Silva Pessoa, then head of the Brazilian peace delegation at Versailles, was chosen to fill out the term, 1918-22. For the presidential term 1922-26, Dr. Arturo da Silva Bernardes was elected. Brazil's centennial anniversary was celebrated by an exposition held in Rio de Janeiro, beginning Sept. 7, 1922. Secretary of State Hughes attended as official delegate of the United States. The cordiality displayed in Secretary Hughes' reception received material confirmation in the most-favored nation agreement reached between Brazil and the United States in October, 1923.

Throughout the period reviewed Brazil's leading preoccupation was her industrial development. Possessing vast economic resources of timber, coal, iron, and water power, it was only a question of years when Brazil would become a nation of great wealth and economic independence. To this end the government's policy was plainly paternalistic. An irrigation programme was announced in 1915 and was rapidly being pushed; local coal mines and the sources of hydroelectric power were being tapped; a loan of \$25,000,000 was being applied to the electrification of the central Brazil Railways; protective tariffs on the imports of textiles and the like were being formulated for the encouragement of native industries. To cope with the social problems to which the country's industrialization was giving form, a national labor council was erected in 1923 with an ambitious programme for research. This was to include the study of labor disputes, work days, women and children in industry, social insurance, rural credit banks, etc. Another evidence of the new orientation was the presence, up to 1924, of foreign missions in the country: an American mission to advise on naval matters, a French on military affairs, and a British on finances. See also PAN-AMERICAN CONFERENCES.

BREASTED, JAMES HENRY (1865-). An American historian (see VOL. III). He became head of the Department of Oriental Languages in the University of Chicago in 1915, Earl Lecturer at the Pacific School of Religion and the University of California (1918), Hale Foundation Lecturer at the American Academy of Science in Washington, D. C. (1919), and

president of the American Oriental Society in 1918. In 1919 he was appointed director of the Oriental Institute of Chicago, and in the year following he had charge of the archaeological survey for the Institute, in Mesopotamia. He is author of *Outlines of European History, I*, with J. H. Robinson (1914); *A Short Ancient History* (1914-15), *Ancient Times, A History of the Early World* (1916), *Survey of the Ancient World* (1919); *History of Europe, Ancient and Medieval*, with J. H. Robinson (1920); *Ancient History Atlas* (1920); *General History of Europe*, with Robinson and Smith (1921); and *The Oriental Institute of the University of Chicago, a Beginning and a Program* (1922).

BRECK, JOSEPH (1885-). An American art director, born at Allston, Mass. He was graduated from Harvard, studied art in Europe for a year, and did graduate work in art at Harvard, 1908-09. He was appointed Assistant Curator in the Department of Decorative Arts at the Metropolitan Museum in 1909 and director of the Minneapolis Society of Fine Arts, 1914. In 1917 he returned to the Metropolitan Museum. His works in art scholarship include: catalogues of the Romanesque, Gothic, and Renaissance sculptures in the Metropolitan Museum. He is a member of the American Association of Museums, the American Federation of Arts, and the Association of Art Museum Directors.

BRENNERT, HANS (1870-). A German author and poet, born in Berlin. He studied political economy and history, but turned to literature, and has written two volumes of verse, *Landsturm* (1914) and *Frühlingsküsse* (1918); three books of short stories, *Jungfern und Junggesellen*, *Lieblose Geschichten* (1906), *Lumpel* (1916), and *Der Erdbeersüsse Mund* (1919); and the comedies, *Die Hasenpfote* (1901), *Die Indische Amme* (1901), *Der Kaisersjäger* (1905), *Blau und Rot* (1916), *Von Funf bis Sieben* (1918), and *Bumerang* (1920), besides numerous adaptations of plays from the Danish and French, alone or in collaboration with Erich Urban and others.

BRENT, CHARLES HENRY (1862-). An American bishop (see VOL. III). He was elected bishop of New Jersey in 1914 but declined. In 1919 he accepted the bishopric of western New York. In 1921 he was Duff Lecturer at the Universities of Edinburgh, Aberdeen, and Glasgow, and a member of the board of overseers of Harvard University. For his services as chaplain at the General Headquarters of the American Expeditionary Forces in France in 1918-19, he received the Distinguished Service Medal and other honors. He is author of *Presence* (1914), *Prisoners of Hope* (1915), *Inspirations of Responsibility and Other Papers* (1915), *The Revelation of Discovery* (1915), *A Masterbuilder* (1916), *The Conquest of Trouble and the Peace of God: Musings* (1916), *The Mount of Vision* (1918); *The Commonwealth of Mankind*, a sermon (1918), and *Soldiers of the Wooden Cross*, an address (1919).

BRENTANO, FRANZ (1838-1917). An Austrian philosopher (see VOL. III). He died in March, 1917, and left behind a large number of unpublished scientific writings. Their general content was made known to the scientific world through the biography published in 1919 by Oscar Kraus, with reminiscences by Carl Stumpf and Edmund Husserl. The papers deal largely with logical theory, including the theory of ob-

jectives as developed by the so-called Austrian school, the notion of substance, and the scientific utility of that conception. One of the most interesting articles is on the Lorenz-Einstein problem. In it Brentano has pointed out the assistance which might be obtained from the consideration that physics and chemistry deal merely with the relations and transformations of the accidents of an immutable substance.

BRENTANO, LUJO (1844-). A German economist (see VOL. III), descendant of the Brentano family prominent in the romantic period of German literature. He has a great number of works on economic and philosophic subjects to his credit; within the decade 1914-24 he published *Die Anfänge des Modernen Kapitalismus* (1916); *Die Byzantinische Volkswirtschaft* (1917); *Arbeitslohn und Arbeitszeit nach dem Kriege* (1918); *Der Weltkrieg nach E. D. Morel* (1921); and *Clemens Brentano's Liebesleben* (1921).

BRENTANO, THEODORE (1854-). An American jurist and public official, born at Kalamazoo, Mich., and educated in the public schools of that city and in Germany and Switzerland. In 1882 he was admitted to the bar by the Supreme Court of the District of Columbia. He acted as attorney in the office of the corporation counsel of Chicago in 1887 and in the following year was assistant city attorney. From 1890 to 1921 he was judge of the Supreme Court of Cook County, Ill., serving also as chief justice. He was appointed Minister to Hungary by President Harding, in 1922.

BRERETON, LEWIS H. (1890-). An air attaché of the American Embassy in Paris, born in Allegheny, Pa., and educated at St. John's College and the United States Naval Academy. In 1919 he was rated military aviator, for distinguished service against the enemy in action at the front.

BREST-LITOVSK, TREATY OF. See AUSTRIA-HUNGARY; RUSSIA, *History*; WAR, DIPLOMACY OF THE.

BRETHREN, CHURCH OF THE. The largest of the five branches of the denomination known as the German Baptist "Dunkers," organized in 1708 at Schwarzenau, Germany, and in this country in 1719. The number of communicants increased from 95,000 in 1914 to 115,241 in 1923, the number of congregations from 1000 to 1024, and the ministers from 3060 to 3264. In 1923 there were 1302 Sunday schools with 149,528 pupils. Mission work was carried on throughout the decade in India, China, Sweden, and Denmark, and was begun in Africa in 1923. Subsidies were made to 10 colleges. The Five-Year Movement in the church was carried on, from 1920 to 1924 inclusive, for the purpose of general expansion in membership, missionary, and educational fields. *The Gospel Messenger* and *The Missionary Visitor* were the official publications of the denomination during the decade.

BRETON, ANDRÉ (?-). A French poet, one of the most important representatives of the Dadaist school in France. He published an exposé of the doctrine of Dada in the *Nouvelle Revue Française* (August, 1920). Besides this he is author of *Rieuse, La Forêt Noire*, influenced by Rimbaud and Mallarmé, and *Clé de Sol*.

BRETT, GEORGE SIDNEY (1879-). A Canadian professor of philosophy. He was educated at Christ Church, Oxford, and after his

graduation entered the Indian Educational Service. He was called to the University of Toronto in 1908, where he occupied first the position of lecturer and then that of professor of philosophy (1916-). His works include *The Philosophy of Gassendi* (1908) and a standard *History of Psychology*, 3 vol. (1912-21).

BREWER, DANIEL CHAUNCEY (1861-). An American lawyer, born at Boston, and educated at Williams College and the law department of Boston University. In 1887 he took graduate courses at Princeton, and was admitted to the bar the next year, and from that time practiced in Boston. He was trustee, director, or officer for many public service, religious, and educational corporations. He was president of the North America Civil League for Immigrants; a member of the Immigration Committee of the National Civic Federation, the Massachusetts Committee of Public Safety, and the Massachusetts Constabulary Commission; and in 1917-18, was chief of the Foreign-Speaking Soldier Section of the General Staff, United States Army. He was the author of *Rights and Duties of Neutrals* (1916) and wrote on international law in various reviews.

BREWSTER, BENJAMIN (1860-). An American bishop, born at New Haven, Conn., educated at Yale University and at the General Theological Seminary, New York City. In 1886-1906 he was minister or rector of churches in New York City, South Orange, N. J., and Colorado Springs, Colo. He was dean of Saint Mark's Cathedral, Salt Lake City, Utah, 1906-09, and from the latter year until 1916 he was missionary bishop of western Colorado. In 1916 he became bishop of Maine.

BRIAN, DONALD (1877-). An actor and singer born at St. Johns, Newfoundland. After his first stage appearance at Lawrence, Mass., in 1896 as Hardie Grant in *Shannon of the Swath*, he appeared continuously in American theatres; later successes included characterizations of Sandy Blair in *The Girl from Utah* (1914), the Grand Duke in *Sybil* (1916), André de Courcy in *Her Regiment* (1917), Robert de Lambrissac in *The Girl Behind the Gun* (1918), and Sunny in *Buddies* (1919). This last rôle made him known all over the United States when he toured with the production, 1920-21.

BRIAND, ARISTIDE (1862-). A French statesman (see VOL. III). It was during the War that M. Briand especially distinguished himself. He was Minister of Justice from Aug. 26, 1914, to Oct. 29, 1915, and in the latter year he succeeded Viviani as premier, continuing in this office until Mar. 20, 1917, when Clémenceau came into power. His ambition was to equalize military efficiency of the Allies, and he succeeded in taking the first steps toward this end, in spite of the opposition of the French Parliament, who wanted more than their share in the conduct of the War. He also came into conflict with the British in regard to the Saloniki expedition. Later, when he was Minister of Foreign Affairs, he succeeded in bringing Rumania into the War under the Allies. On Jan. 6, 1921, he became prime minister for the seventh time. He was faced with the difficult task of protecting France in the enforcement of the Peace Treaty. In November, 1921, he attended the Disarmament Conference at Washington and pleaded his country's cause very eloquently.

BRICK. See ROADS AND PAVEMENTS.

BRIDGE. A card game which bears considerable resemblance to whist, four players taking part. Following the opening lead, the partner of the dealer places his cards upon the table exposed. These cards are played by the dealer in the fashion of "dummy" whist. The trump suit is named by the dealer or his partner, the former having first say. "No trumps" also may be declared. The value of the tricks and honors varies with the suit named as trumps, honors not counting toward the winning of the rubber but being added afterwards to the trick score to fix the value of the rubber.

According to the latest revision of the rules for the game each trick above six counts two points with spades as trump, four with clubs, six with diamonds, eight with hearts and twelve with no trumps. Thirty points constitute a game, the rubber ending when either of the contesting sides has captured two games, the winners being permitted to add one hundred points to their score.

The honors comprise ace, king, queen, jack, ten of the declared suit. If one side holds three honors it counts twice the value of a trick; four honors, four times the value; five honors, five times. In a no-trump declaration the side holding three aces scores thirty for honors; four aces forty and if four aces are in one hand one hundred is tallied for honors.

A recent development of the game is called auction bridge which has more of the gambling flavor, so to speak, than the original game. The dealer after inspecting his hand must assert his ability to win by at least one "odd" trick and then each player in turn starting at the dealer's left has the right to outbid the dealer by doubling, redoubling or overcalling until all the players are content. The actual playing of the combined hands rests finally with the partners making the highest bid.

Consult: R. F. Foster, *Bridge Tactics and Laws and Principles of Bridge*.

BRIDGE, FRANK (1879-). A British composer, born at Brighton, and educated at the Royal College of Music in London. He has the reputation of being one of the finest viola players in England. In 1910-11 he was conductor of the Brema opera season at the Savoy Theatre, and in 1913 assistant to Beecham at Covent Garden. As a composer he shows a decided predilection for chamber music. His works include a string quartet in E minor; three *Idylls*, three *Noveletten* and a *Phantasy* for string quartet; a string sextet in E, performed at the Berkshire Chamber Music Festival (1923); a piano trio; and for orchestra, a symphonic poem, *Isabella*, a *Dance Rhapsody*; a suite, *The Sea*, and a *Dance Poem*.

BRIDGEPORT. A city and port of entry of Connecticut, on Long Island Sound. The population increased from 102,054 in 1910 to 143,555 in 1920 and in 1924 was locally estimated at 155,000. During the War a large proportion of the ammunition used by the United States and the Allies was made in this city. The Remington U. M. C. Company built several large factories employing 20,000 men night and day in eight-hour shifts. Two or three other munition factories were opened and practically every metal-working concern in the city was employed on sub-contracts. To meet the housing problem raised by continued increase in population, some of the factories and a specially-organized housing company erected several thousand new dwellings.

BRIDGES. Bridge construction throughout the world naturally suffered during the War, and for a while in the period of readjustment subsequent to the close of hostilities. In Europe naturally in the war period there was demolition of bridges rather than construction, except of a most temporary character. After the Armistice, however, it was of course essential to carry on a vast amount of reconstruction in such countries as France, Poland and Austria, where the destruction of the railways had been ruthless and in places complete. For a while the simplest and even temporary repairs were made, but gradually permanent construction was developed as funds were made available. It was the general lack of funds for such important expenditures that restricted bridge building, not only in Europe but also in the United States, for a period of economy and retrenchment was enforced on the railways, as well as the governments, and while some important bridges were built it was not for a considerable while that many large structures were planned.

By 1924 it was realized that structural work had reached a point, so far as design and materials were concerned, where the size of a bridge depended upon financial conditions making possible its development, rather than upon what could be designed and fabricated. Naturally the cost of iron and steel subsequent to 1914 increased along with coal, so that on this score alone it would appear probable that the limits of large bridge construction might be reached within the twentieth century. For example, in the interval 1914-1924 the prices of iron and coal had more than doubled, while a timber tuss bridge, once inexpensive and common in the United States, by 1924 would involve greater expense than the equivalent in either a steel or concrete bridge.

Likewise the masonry and stone arch was no longer economically feasible, and the last and largest stone arch to be built was the arcaded railway bridge of 282-foot span, erected in 1905 over the Isonzo River in Istria, Italy. Erection of this structure was facilitated by the fact that this region not only produced suitable materials but also developed highly skilled stone masons who were in demand for construction work all over Europe. This bridge was destroyed in 1916 in the course of military operations.

On the other hand while the use of wood, masonry and steel tended to become more restricted it was found possible to employ concrete and reinforced concrete for various types from small bridges to such a concrete arch as that spanning the Seine between the towns of St. Pierre-du-Vauvray and Ande (about 16 miles from Rouen) which had a clear span of 131.8 meters (432.44 feet). Concrete construction lent itself readily to bridge building, not only on account of the moderate cost of material, but also as it produced a bridge which required a minimum of maintenance and naturally reduced outlay for inspection, painting and other care. As additional experience was gained in the design of concrete structures; it was found possible to increase the length of span and capacity, and the bridge engineer often was able to construct structures of armored or reinforced concrete far superior to those of steel.

With their additional durability and decreased cost of maintenance, in many cases it was pos-

sible also to secure a pleasing architectural appearance, so that such structures with the addition of suitable embellishments, were built in many cases as memorials. Reinforced concrete bridges came to be constructed in a variety of types ranging from small highway bridges to spans of over 600 feet, and high viaducts, such as the Tunkhannock viaduct on the Delaware Lackawanna and Western Railroad, were possible.

In the various undertakings proposed bridge engineers were in no way daunted at designing bridges of great capacity and extreme length of span. This was well demonstrated in the two-deck suspension bridge designed to cross the Hudson River at New York City with a river span of 3240 feet and two shore spans each of 1650 feet making with the approaches a total length of bridge of 7340 feet. This project involving as it did a large capacity bridge supporting wide roadways and multiple tracks, on its engineering side, at least, received the approval of bridge and other engineers of eminence who expressed no doubt as to the feasibility of such an enormous undertaking. In connection with bridges of large capacity and long span such as were built or projected from 1914 on, it must be realized that such structures were largely possible only by the use of alloy steels, such as nickel steel, chromenickel steel, and silicon steel which had considerably greater strength than carbon steel, so that it became possible to secure adequate strength with less weight of material. The substitution of nickel steel for the older structural steel might afford a saving of 10 to 15 per cent in the cost of a chain or stiffening truss.

The leading types of bridges where considerable length of span was involved and steel construction must be employed, were the arch, the cantilever and the suspension. During the period under review the architectural feature of such bridge construction as well as those built of masonry or concrete was receiving more attention. It was found in the larger and monumental designs that often it was possible to secure grace and beauty. In fact the appearance of the water front of New York City is materially enhanced by the large structures crossing the East River, and for many years the Firth of Forth bridge has stood as a design of pronounced beauty. Of these types the cantilever principle was the least adaptable to artistic treatment, but even here a long span can be made attractive, as is demonstrated in the Firth of Forth bridge just mentioned.

An arch bridge without question can be made beautiful in appearance. Such a bridge as the Hell Gate bridge of the New York Connecting Railways, standing out in bold relief, is typical, not only of strength but of graceful design which was to be repeated in large measure in the New Sydney, Australia, bridge. The suspension bridge, which may be said to be purely American in its development, also lends itself to architectural treatment, not only in the graceful curves of its suspending cables, but also in the towers employed. Apparently no limit of length had been reached for such bridges, and in addition to those about New York City, and the Philadelphia-Camden bridge under construction in 1924, long span suspension bridges were proposed for Detroit, and Nagasaki, Japan.

Highway development in the United States,

due to the increased use of motor vehicles, was responsible for a large number of bridges of varying sizes and designs. Furthermore with the increased weights of motor vehicles it was found necessary to replace many of the country highway bridges, while to obtain through routes wide rivers had to be bridged or crossed. Usually these bridges were erected by public authority and for the most part were free, but where toll bridges were provided the increase in traffic made them in many ways remunerative.

Highway bridges were required across the Hudson as at Bear Mountain and Poughkeepsie, and across the Willamette in the vicinity of Portland, Ore., of which the 350-foot steel arch at Oregon City built in 1922 was a conspicuous example. Several bridges were proposed for San Francisco Bay of which that over Carquinez Straits at San Mateo was under construction in 1924. In the previous year the United States War Department had granted permission for the construction of two vehicular bridges across the lower end of San Francisco Bay. One of these was to have its western end at Little Coyote Point about 24 miles by highway south of San Francisco, while the other involved a bridge at Dumbarton near the site of the railroad bridge of the Southern Pacific. The first of these projects involved a 6-mile bridge across the south end of San Francisco Bay from San Mateo. Inasmuch as there was navigable water with a depth of 40 feet for a distance of 1 mile this was to be bridged by a 200-foot lift span and arches of 250-foot span. Shorter concrete arches were to be employed for 2 half-mile approaches and the remaining 4 miles was to consist of trestle or fill. The roadway was to be 60 feet wide.

Suspension Bridges. This type of bridge construction not only was developed in America but was employed there for the longest spans and for the heaviest loads. In Europe, on the other hand, no wire suspension bridges of any size had been built, and but few where the cables were made of eye-bars, or of plates and angles. The Elizabethan bridge at Budapest, built in 1903 with a span of 951 feet, a bridge across the Oder at Breslau, built in 1911 with a span of 415 feet, and the only suspension bridge across the Rhine at Cologne, completed in 1917, with a span of 605 feet, are outstanding examples. In the case of the Cologne bridge the cables are formed of plates and angles which are rivetted into tension members. The horizontal thrust at the ends is taken up by box stiffened girders extending from end to end so that at the anchorage only vertical forces must be resisted. The steel towers of this bridge are plain and without decorative features, so that the structure as a whole in its architectural design does not compare favorably with American work of the same character.

In most of the more notable American suspension bridges wire cables were employed, and this type of construction was employed in the Delaware River bridge under construction in 1924 where parallel wires were united in cables aggregating 30 inches in diameter. These cables were the largest to be used and the employment of parallel wire construction for such large members received some criticism, as it was argued that eye-bar cables would be preferable.

Proposed Hudson River Bridge at New

York. The longest span and heaviest bridge yet to be proposed was the design of Gustav Lindenthal to cross the Hudson River at New York City with a span of 3240 feet to which reference has been made. Elaborate plans for this structure were developed and its feasibility was accepted by engineering experts called in to pass upon the project, but it was doubtful, however, that such a structure in the form designed ever would be built, notwithstanding it provided for a vast capacity of tracks and roadways, and involved comprehensive transportation schemes with extensive approach and terminal arrangements. Nevertheless, it must be considered as a bold and interesting engineering conception, though from an economic standpoint it was questionable whether it could successfully compete with a system of tunnels.

Philadelphia-Camden Bridge. In 1921 an interstate bridge commission of Pennsylvania and New Jersey approved the plans for the erection of a suspension bridge across the Delaware River between Philadelphia and Camden prepared by a board of engineers consisting of Ralph Modjeski, George S. Webster and Laurence A. Ball. The design involved a suspension bridge with a central span of 1750 feet, which exceeded by 150 feet the Williamsburgh Bridge across the East River at New York, previously the longest suspension bridge. The Delaware River bridge was 3536 feet long from anchorage to anchorage with a total length of bridge structure, including approaches, of 8126 feet. The selection of the suspension type with wound wire cables was interesting in view of the fact that this form of bridge was decided on after a consideration of both the cantilever and the arch types. The suspension bridge was much lighter, involving 33,000 tons of steel, as compared with 47,000 tons for the cantilever, and was believed to afford less risk in construction, as well as being adapted more readily to the subdivision of the contracts. Furthermore, the foundations and the anchorages for such a bridge were less extensive and it could be constructed much more quickly.

This bridge was for vehicular traffic only, and with a total width of 57 feet between curves provided six vehicular lanes, each 9½ feet, and outside of the 57 feet roadway there were two car tracks in each direction, and two 10-foot pedestrian ways, the latter being placed above on the upper lateral bracings.

The two towers were solid built steel posts bearing the cables firmly attached to their saddles, following the practice in the Manhattan Bridge across the East River at New York City. The cross-section of each post increases from 7 x 12 feet at the top to 7 x 40 feet at the base. The two 30-inch cables are spaced 89 feet from each other, and while these cables were the largest ever to be formed of parallel wires, being made up of 16,500 parallel wires, each being 0.192 inches in diameter, they were selected in preference to four cables. This feature of the design was criticized by some bridge engineers as the largest cables with parallel wires hitherto employed were the 20.5 inch cables of the Manhattan Bridge at New York City.

From the cables the suspended hangers were spaced about 20 feet, and each consisted of four 2½ inch galvanized wire ropes attached to a cast steel saddle. A short channel length was considered desirable for the stiffening trusses, 20.5 feet for the main span and 20.5 feet for the

side span. These trusses were of simple triangular web system continuous across the span, and were supported at the towers by stiffening hangers.

Local conditions required that the anchorages must be placed a considerable distance back of the towers so that suspended side spans were adapted whose length was slightly less than the main span. The cables have a sag of 200 feet. For the main part of the structure high strength alloy steel was selected and high carbon steel wire for the cables and hangers. A unit stress of 72,000 pounds per square inch was in the cable wires and was considered permissible in the emergency live loading, and 60,000 pounds under normal full loading. The two river piers measured 70 x 143 feet at the base, and required for both some 62,000 cubic yards of masonry. They were granite faced down to the point below water level, and were built by sinking pneumatic caissons to the rock. See FOUNDATIONS.

Bear Mountain-Hudson River Suspension Bridge. In 1924 a large suspension bridge across the Hudson River above Peekskill and between Bear Mountain on the west and Anthony's Nose on the east bank was reaching completion. Here the opposite shores of the river approach within 1600 feet of each other, making possible an advantageous location of a bridge with a reasonable short span where there was ground suitable for foundations for towers near the shore line. This bridge affords accommodation for vehicular traffic between New York and New England, as well as the more adjacent regions on both sides of the river, and was the only bridge across the Hudson so far to be constructed below Poughkeepsie, where there was a railroad bridge, although plans had been prepared for a state vehicular bridge at Poughkeepsie for which authority was granted by the state legislature in 1924.

The Bear Mountain bridge design involved a suspension bridge with straight (unloaded) backstays. It was of 1632 feet main span, and had steel towers 355 feet above high water foundations, resting on concrete piers and supporting two steel wire cables 18 inches in diameter, each containing 7452 wires of 0.192 inches in diameter. These cables are placed 61 feet, 4 inches centre to centre, and carry double suspender steel wire ropes, 2½ inches in diameter to which are attached transverse suspender beams supporting stiffening trusses 30 feet deep and 55 feet centre to centre. On the east there is an approach span 220 feet long, crossing the New York Central Railroad tracks, while on the west bank there is a truss span of 220 feet length also, and a 100-foot truss of two 50-foot plate girder spans.

The total length of the Bear Mountain bridge between abutments is 2238 feet. The bridge floor is 48 feet wide between railings, affording a 38-foot roadway and two 5-foot sidewalks. The cable wires and the suspender ropes are of 220,000 pounds ultimate strength, being made of carbon steel, as are the other parts of the bridge excepting the stiffening trusses which are of silicon steel. At either end inclined tunnels for anchor pits were carried into the bank about 100 feet deep, and here were placed cast steel bases to which the anchorage eyebars forming the terminals of the cables were connected.

Brazilian Suspension Bridge at Florian-

opolis. A notable eye-bar suspension bridge with a 1114-foot span was completed in 1924 at Florianopolis in the province of Santa Catharina, Brazil, being a combined highway and railway bridge connecting the island on which the city is located with the mainland. Not only was this one of the world's largest suspension bridges, but it was the first application of modern eye-bar chain construction to such a bridge, although this type of design frequently had been proposed for structures of this class. In connection with the use of eye-bars for the chain and the unloaded backstays, there was involved also an unusual stiffening truss which developed considerable rigidity and economy.

The eye-bar type of chain was adopted inasmuch as heat treated eye-bars of 75,000 pounds per square inch minimum elastic limit could be fabricated, making possible a working stress of 50,000 pounds per square inch in an eye-bar chain, rendering this type more economical than a wire cable suspension bridge. The eye-bar chains are carried by towers formed of two-column steel bents with battered legs rising to a height of 225 feet above the base on the pier. The stiffening trusses have curved top chords so arranged as to afford maximum depth at the quarter-points, for the top chord in the middle section is formed by the suspension chain itself. The truss spacing is at 33½ feet which gives a 28-foot clear width of roadway. The backstays support no load but are carried back down directly to masonry anchorages, one of which is on rock, while the other is carried by a pile foundation.

The approaches to the suspension span are steel viaducts, the spans directly adjacent to the towers being each of 185 feet. The two chains were formed each of four eye-bars 12 inches wide from anchorage to anchorage. Their thickness varied from 2 inches for the backstays to from 2 inches to 1¼ inches for those on the main span. The suspenders from the chains are of two parts, being formed of 1½ inch galvanized wire steel rope socketed to clevis attachments of the top chords of the trusses. The total dead weight allowed for was 4370 pounds per lineal foot of span with a live load of 2000 pounds.

Continuous Truss Bridges. One of the most important types to be developed in American bridge practice was the continuous type which found favor for railway bridges. In this type not only was strength and economy of material secured but also ease of erection so that it was extensively used by American railways. Thus the Sciotoville bridge over the Ohio River, which was completed in 1917, had two spans each of 775 feet, thus making a record for span length of this type of construction. In the following year the Allegheny River bridge was built, near Pittsburgh, with three continuous spans of 272, 520 and 347 feet, followed by three continuous spans of 347, 350 and 272 feet. In the same year the Hudson Bay railway bridge was built over the Nelson River at Kettle Rapids, and consisted of three continuous spans of 300, 400 and 300 feet.

Arch Bridges. The arch type of bridge was selected over the cantilever for the Sydney Harbor bridge in Australia, for which a contract was awarded early in 1924. This bridge with a span of 1650 feet essentially reproduced the Hell Gate, New York, arch bridge, which was designed for but one half of its live load. The

Australian bridge which was to be 170 feet above high water, was designed to carry four lines of railway tracks and 80 feet of roads and footways. A notable arch bridge, but of shorter span, construction on which was begun in 1923, is a single steel arch of 640 feet across the Niagara Gorge at Niagara Falls built for the Michigan Central Railroad to replace a cantilever bridge constructed in 1883. Notwithstanding strengthening in 1900 the older structure had become inadequate and obsolete. The new bridge, which has a single deck carrying a double track was designed as a two-truss, two-hinged spandrel braced type with the lower chords in the form of a parabolic curve and with the top chords horizontal. It has a rise of 105 feet.

Reinforced Concrete Bridges. The construction of reinforced concrete bridges had developed to a stage in 1923 where a design was presented for the bridge to cross the Elorn River in Brittany, between Brest and Plouegastet, a tidal estuary. This bridge had an extreme length of 2300 feet in addition to approach viaducts at either end of 425 feet in length. There are three spans of 613.36 feet, 639.6 feet and 672.4 feet in each case from centre to centre of the piers, making, of course, the clear span somewhat less. There is provided a free navigable channel 230 feet wide with a height from the water surface to the arch crown of the principal span of 118 feet, the arches in each case being identical in construction, of a radius of 459.2 feet. They are built up of parallel hollow ribs of a rectangular section, the width of each rib being 8.7 feet.

This bridge has a double deck 26.24 feet in width to the outside of the sidewalks with a roadway of 19.68 feet in width. The overall width, however, is increased at the crown of the arch to 30.5 feet. The railway level is 17.29 feet below the under side of the highway deck, for the bridge carries the tracks of the Chemin de Fer de l'Ouest-Etat. The roadway or upper platform was so designed as to receive the third classification in order of importance among French government roads, being styled as a Chemin de Grande Communication.

The two river piers are built upon pile foundations sunk to granite bed rock. The design which was prepared by M. Freyssinet was selected in competition with eight other bids, three of which were for a metallic structure and five for one of concrete construction. The plans chosen provide for the longest arches yet attempted, and the work was to be put under way as soon as government funds were available.

The longest concrete arch to be built up to 1924 was in northern France where a single span bridge of 131.8 meters (432.44 feet), was built across the Seine between the towns of St. Pierre-du-Vauvray and Ande, replacing an old iron bridge which had been damaged by passing vessels during high flood. In this bridge there is a single arch composed of two hollow ribs of large section to which are attached concrete encased steel bands supporting the floor system. Only at the arch ends were the ribs tied together, and the difference between the axes of the two ribs is 8.9 meters. The rise from the spring to the crown of the arch is 25 meters, and the exterior width of each arch is 2.5 meters or (7.2 feet), with a depth varying from 4.1 meters at the springing to 2.5

meters at the crown. The floor system has a total width of 8.80 meters (28.87 feet) of which 8 meters is the usable width, providing a roadway 3.5 meters in width and 2 sidewalks of 1.345 meters each.

Hangers made of steel bands encased in concrete carry a floor system on reinforced concrete lattice girders spaced 5.2 meters centre to centre. Each hanger consists of 40 spans of steel cable, each 10 millimeters in diameter, and treated with a rich mixture of cement so as to form a band of reinforced concrete 14 centimeters (0.46 feet) square in section, the concrete serving merely against the disintegration of the metal.

Naturally for such a construction the arch centre was most important and two groups of dolphins in the river bed and two others near each bank of the river supported the centring by a system of trusses. The reinforcement of the arch ribs composed of round steel bars of small diameter distributed uniformly in the arch ribs and in the side walls was relatively unimportant, the amount of metal varying from one part of the rib to another, and ranging from 10 bars of 14 millimeters in diameter towards the key to 10 of 7 millimeters in diameter for each of the horizontal faces to 11 bars 7 millimeters in diameter for each of the side walls.

A large reinforced concrete bridge for which a contract at \$1,870,000 was let in the spring of 1924, was to span the Minnesota River connecting Fort Snelling and Mendota, Minnesota. This bridge is 4119 feet in length, and contains twelve 304-foot spans, carried on foundations made by sinking cylindrical reinforced concrete caissons, four to each pier. The superstructure is of ribbed arch construction, two ribs to each span, and the deck was supported from ribs on columns and consisted of flat slab designs with depressions over the columns. The deck carries a 45-foot roadway with a 6-foot sidewalk on each side. There is a hand railing of paneled concrete 4 feet 3 inches high, with paneled steel railing 3 feet 6 inches high between posts. The roadway carried double track street car lines. The bridge reaches a maximum height of 120 feet above the river.

An important large municipal American war memorial in the form of an arch highway bridge was completed over the Vermillion River at Danville, Illinois, in 1924, forming the northern terminus of the Danville, Marshall and St. Louis Railway. This bridge was a reinforced concrete structure 1037 feet in length, and consisted of six arches and seven short approach spans. The longest arch, forming the river span, was 195 feet, and the shortest was 107. The bridge is 75 feet high at the river, and its deck contained a 30-foot roadway and two 7-foot walks, flanked on either side by ornamental reinforced concrete open hand rails of the Greek cross design.

Cantilever Bridge. A notable cantilever bridge, the third largest to be constructed was building in 1924 across San Francisco Bay. In the spring of 1923 the United States War Department granted permission to construct a cantilever bridge across Carquinez Straits between Vallejo and Valona, Cal., spanning one of the upper reaches of San Francisco Bay. The project involved a cantilever bridge with a central pier and two 1100-foot spans. Work was started shortly after the permission was

obtained and on August 29 the first concrete was poured in the north anchor pier. This structure was designed for vehicular traffic exclusively and would be the longest bridge of this type used for such a purpose. There were to be two 1100-foot spans and two 500-foot spans, the former consisting of two 300-foot overhanging arms and a 500-foot supported approach anchor-span.

There was a centre pier located in the Strait but on either side of this central pier a clear channel 1070 feet wide would be left. The other piers would be located within the pier head lines and each would be reached by a 500-foot approach anchor-span. The new bridge was estimated to cost \$4,000,000 and would be completed by July 4, 1925.

Bascule Bridge. The bascule bridge in its various types of which there were several of considerable merit continued in vogue during the period under consideration both for railway and highway bridges. The most notable designs of bascule bridge were the Rall type, and the Scherzer type. The length of span and capacities of bascule bridges had been increased, and in many cases they were considered preferable to swing bridges for crossing narrow waterways where there was considerable traffic. This type of bridge was extensively employed in Chicago, and here in 1923, 22 simple trunnion bridges were employed. Two of these were built with double decks and that across the Chicago River at Wells Street completed in 1921 had a span of 268 feet centre to centre of trunnions affording a clear channel width of 220 feet. Each leaf of this bridge is carried by two trunnions and weighs 2500 tons of which 1300 tons is counterweight. In addition to Chicago these bridges found extensive use across the waterways of Seattle.

BIBLIOGRAPHY: Among the important works on bridge construction published in the period under review were the following:

J. A. L. Waddell, *Bridge Engineering* (New York, 1916); id. *Economics of Bridge Work*, (New York, 1921); C. A. Ellis, *Essentials in the Theory of Framed Structures* (New York, 1922); *The Structural Engineers' Handbook Library* (New York, 1923-24), edited by George A. Hool and W. S. Kinne, included the following titles, which were special articles prepared by authorities in the different fields, and covered a wide range of subjects connected with bridge building: *Foundations, Abutments and Footings* (1923); *Structural Members and Connections* (1923); *Stresses in Framed Structures* (1924); *Steel and Timber Structures* (1924); *Reinforced Concrete and Masonry Structures* (1924); *Movable and Long Span Steel Bridges* (1923). See also **FOUNDATIONS**.

BRIDGES, CALVIN BLACKMAN (1889-). An American biologist, born at Schuyler's Falls, N. Y., and educated at Columbia University. He was research assistant in genetics to Professor Morgan (1910-19) and member of the research staff in genetics at the Carnegie Institution of Washington (1919). He published numerous papers on genetics and was co-author of *Mechanism of Mendelian Heredity*, with Muller, Morgan, and Sturtevant (2d. ed., 1923).

BRIDGES, ROBERT (1844-) An English poet laureate. In 1923-24 he had the Honorary Fellowship in Creative Arts, University of Michigan. He published *Anthology in English and French* (1916), *Yattendon Hym-*

nal, Ibant Obscure (1917), *Britannia Victria* (1919), and *October, and Other Poems* (1920).

BRIDGES-ADAMS, W. (1889-). A British stage director, educated at Oxford. He gained experience as an actor in the provinces and in 1910 was assistant manager to William Poel. A year later he joined the late Laurence Irving. He was part manager and producer for the Bristol Repertory Theatre, 1914-15, and in 1916-17 manager and producer for the Liverpool Repertory Theatre, which he renamed the Playhouse. In 1919 he undertook the direction of the Stratford-on-Avon Shakespearean Festivals and founded and organized the New Shakespeare Company under the auspices of a joint committee of the Shakespeare Memorial National Theatre and the governors of the Memorial Theatre, Stratford-on-Avon. Bridges-Adams designed the scenery for the Gilbert and Sullivan revivals at the Prince's Theatre during 1919-21.

BRIDGMAN, PERCY WILLIAMS (1882-). An American physicist, born at Cambridge, Mass., and educated at Harvard. Receiving a fellowship, he continued his scientific studies and also served as an instructor in physics, of which department he was made full professor in 1919 and given the directorship of the Jefferson laboratory. His researches have included important studies on various topics in mechanical physics, such as measurements of high hydrostatic pressure, and in physical chemistry, such as change of phase under pressure and modifications of phosphorus.

BRIEUX, EUGÈNE (1858-). A French dramatist (see **VOL III**). His recent works include *Le Bourgeois aux Champs* (1914) and *Les Américains Chez Nous* (1920).

BRIGADE. See **ARMIES AND ARMY ORGANIZATION**.

BRIGHAM YOUNG UNIVERSITY. An institution at Provo, Utah, under the auspices of the Church of the Latter Day Saints, founded in 1875. The enrollment increased from 650 in 1914 to 1123 in 1923-24, the faculty was increased in the same decade from 30 to 80 members, and the library from 6000 volumes to 30,000 bound volumes and about the same number of pamphlets. President, Franklin Stewart Harris, Ph.D.

BRIGHOUSE, HAROLD (1882-). A writer of plays and fiction. His recent productions include *The Road to Raebury*, in collaboration with Stanley Houghton (1915), *Hobson's Choice* and *The Clock Goes Round* (1916); *Other Times* and *Three Lancashire Plays* (1920); *Once a Hero* (1922); *The Happy Hangman* (1922), and *The Apple Tree* (1923). His stories include *Fossie for Short*; *The Silver Lining*; *The Marbeck Inn* (1920); *Hepplestalls* (1922), and *The Wrong Shadow* (1923). He filmed *Hobson's Choice* and *The Game* in 1920. During the War he was with the Royal Air Force.

BRIGHTMAN, EDGAR SHEFFIELD (1884-). An American professor of philosophy, born at Holbrook, Mass., and educated at Brown and Boston Universities and at Berlin and Marburg in Germany. He taught successively at Brown University, Wesleyan College (Neb.), and Wesleyan University (Conn.). In 1919 he was called to Boston University. In his philosophy he is a strong advocate of the religious doctrine of personalism. His works include *The Sources of the Hewateuch* (1918) and *Re-*

ligious Values and Recent Philosophy (1921). He is also a contributor to the projected *Encyclopaedia of Protestant Theology*, *The American Journal of Theology*, *The Journal of Religion*, and other periodicals.

BRIGHT'S DISEASE. See NEPHRITIS.

BRILL, GEORGE MACKENZIE (1866-). An American mechanical engineer, born at Poughquag, N. Y., and educated at Cornell University. During 1891-96 he was engineer of tests with the Solvay Process Company of Syracuse, N. Y., of which he then became chief engineer; in 1897 he entered the employ of Swift and Company, of Chicago, serving them as their chief engineer until 1900. He was chairman of the jury of awards on general machinery at the Panama-Pacific Exposition in 1915 and during the War was in the Ordnance Department with the rank of major. He served also as chief of the requirement section of the Emergency Fleet Corporation in 1918.

BRILL, NATHANIEL EDWIN (1861-). An American physician, born in New York and educated at the College of the City of New York and the University of New York. He was appointed physician to Mt. Sinai Hospital in 1891 and clinical professor of medicine at Columbia in 1910. In 1917 he was made a major of the medical officers' reserve corps and director of Base Hospital No 3 in France. In 1910 he acquired much renown for the recognition of an endemic, non-contagious form of typhus fever which had evidently prevailed in New York City at intervals for many years. This aberrant form of typhus is known in honor of its discoverer as Brill's disease. He contributed much to periodical medical literature on this and numerous other subjects and in 1898 translated Klemperer's book on physical diagnosis under the title *Clinical Diagnosis*.

BRINTON, CHRISTIAN (1870-). An American art critic, born at West Chester, Pa., and educated at Haverford College, the Universities of Heidelberg and Paris, and the Ecole du Louvre. Among his works on art are *Modern Artists* (1908), *Masterpieces of American Painting* (1910), *Impressions of Art at the Panama-Pacific Exposition* (1916), *Introduction to the History of Scandinavian Art* (1921), and many catalogues and contributions to leading magazines and art reviews. He also contributed to the *Iconographic Dictionary of Art*. Christian Brinton was decorated by King Gustav V of Sweden in 1917 and in 1915 was made advisory editor of *Art in America*.

BRISBANE, ARTHUR (1864-). An American newspaper editor (see VOL. III). He bought the *Washington Times* in 1917 and the *Evening Wisconsin* in 1918. Both of these he sold to William Randolph Hearst in the following year. In 1918 he became editor of the *Chicago Herald and Examiner*. He resigned from the editorship of the *New York Evening Journal* in 1921.

BRISTOL, MARK LAMBERT (1868-). An American naval officer, born in Glassboro, N. J. He graduated from the United States Naval Academy in 1887 and in 1889 was appointed ensign. During the Spanish-American War he served on the battleship *Texas*. He made a special study of gunnery, torpedoes, and aircraft. From 1913 to 1916 he was in charge of the development of aeronautics for the Navy. In 1917 he commanded the *North Carolina*, conveying troops to Europe, and was given

command of the *Oklahoma* in the American battleship division in European waters in 1918. In 1918-19 he commanded the United States Naval Base at Plymouth, England. He was a member of the International Armistice Commission in Belgium in 1918, and in the following year commanded the United States Naval Forces in Turkey. He served as high commissioner to Turkey in 1919-20 and was a member of the International Commission of Inquiry in the Greek occupation of Smyrna, in 1919. He had general charge of American interests in Asia Minor during the Greco-Turkish campaign of 1922 and did efficient service after the destruction of Smyrna in relief of refugees and protection of American interests, 1922-23.

BRITISH COLUMBIA. A Canadian province on the Pacific coast. Area, 355,855 square miles; population in 1911, 392,480; in 1921, 524,582. In 1921 the urban population numbered 247,562 and the rural 277,020. The rural thus comprised 52.8 per cent of the population, which was a gain over the 48.1 per cent of 1911. Chinese immigration was restricted by a head tax, while Japanese and Hindu immigrants were regulated by diplomatic arrangements. Vancouver, the largest city, had a population in 1921 of 117,217 (100,401 in 1911); Victoria, the capital, had 38,727 (31,600 in 1911); New Westminster, 14,495 (13,199 in 1911). By 1922 enrollment in elementary and secondary schools had increased to 91,919 (44,945 in 1911). The educational system also included 48 high schools, several normal schools, and the provincial university. Total expenditures for education in 1911, \$2,641,522; in 1922, \$7,833,578.

Industry. Only a small proportion of the country was under crops. Intensive agriculture was the rule, the leading activities centering in fruit raising, hop growing, stock raising, and the cultivation of root crops. Oats was the most important field crop. Recent developments were the increasing attention given to barnyard animals (poultry, swine, etc.) and dairy products. Lumbering, pulpwood, etc., ranked first among the industries. In 1921, the value of products was \$71,108,307. Of this, the pulpwood produced was valued at \$4,796,000, and newsprint about \$8,000,000. The woods most sought after were Douglas fir and white spruce. The mineral production of the province ranked second only to that of Nova Scotia. In 1922, the total value of minerals was \$39,423,962 as compared with \$30,076,635 in 1912. Gold, in 1922, yielded \$4,286,718; silver, \$4,828,384; coal, \$14,622,317; lead, \$5,430,265; and copper, \$4,273,700. The undeveloped coal fields were particularly rich. The local fisheries ranked next in importance, the 1922 catch being valued at \$18,872,833. The leading commercial fish were salmon (\$13,106,315), halibut (\$3,918,441), and cod, sturgeon, smelts, sardines, and herring. Whaling brought in \$158,814. The seal industry was, economically, terminated, as only natives were permitted to participate in it. Capital invested in the industry was divided: \$6,765,827 in boats, etc., \$13,185,744 in canning and curing establishments. The depletion of the Fraser River salmon pack was giving provincial authorities much concern and conservation schemes were receiving attention. In 1921, there were in all, 2470 industrial establishments, mainly concerned with the lumber and fish industries,

that represented a capital of \$210,798,811. Employees totaled 28,700; wages, \$35,775,528; and value added by manufacture, \$82,604,700. The total available water power in the province was estimated at over 1,931,142 h.p.; of this 328,977 had been developed.

Trade and Communications. In 1922, there were 4374 miles of railway in the province as compared with 1855 in 1912. Ocean-going steamboats and coastwise vessels were being operated by the Canadian Pacific railway. Communications were regularly maintained between Vancouver and Prince Rupert. The Panama Canal was being utilized to bring Canadian Pacific and Atlantic ports into closer touch. In 1921-22, 37,475 vessels entered and cleared, while 35,705 vessels entered and cleared in the coastwise trade. The trade of the province increased considerably over the period. In 1912, exports and imports were valued at \$20,272,840 and \$49,345,161; by 1923, these were \$93,971,000 and \$60,257,000. Exports consisted of minerals (gold, silver, copper, coal), sea products (salmon, halibut, herrings, whale products and oil), lumber, furs, skins, etc. Fruit was shipped in large quantities to the Canadian prairie provinces.

Government. The province's representation in the Canadian Parliament was increased to 6 in the Senate and 13 in the House of Commons. Revenues for 1921-22 were \$16,987,869 (\$10,479,259 in 1913-14); expenditures for 1920-21 were \$17,436,487 (\$15,762,912 in 1913-14). Women were granted the ballot.

BRITISH EMPIRE. The purpose of this article is to deal with general matters concerning the British Empire as a whole, the affairs of Great Britain, Ireland and the several colonies being set forth elsewhere in separate articles, to which the reader is referred for details.

Much to the chagrin of its enemies, the British Empire failed to disintegrate, on the outbreak of war in 1914, under pressure of the secessionist forces upon which German imperialists had so confidently counted. Only in South Africa (q.v.) were the German hopes of an anti-imperial rebellion measurably gratified, and even there the insurrection led by Boer irreconcilables (Maritz, de Wet, Beyers, and Kemp), in October, 1914, was speedily crushed by Boer loyalists, Premier Botha and Defense Minister Smuts. Conspiracies in India and elsewhere were only flashes in the pan. The Turkish sultan's proclamation of a Holy War failed to move the Moslem masses in British possessions. The Empire held together. Moreover, the self-governing dominions came to the mother country's aid with an enthusiastic loyalty few had ventured to anticipate. Canada enlisted 595,441 men and sent 432,642 of them to fight overseas; Australia sent 329,682; New Zealand raised an army of 124,211 and sent 100,444 soldiers and nurses to distant battle fronts; South Africa mustered 146,515 men, of whom 30,000 were used in Europe and 43,000 in East Africa, besides conquering German Southwest Africa and raising a force of 85,000 colored troopers and military laborers. India, instead of rebelling, supplied 1,679,416 men, to be drawn on for battles in France, on Gallipoli, in East Africa, while the British garrison in India was at one time reduced to as few as 15,000 men. Altogether, the dominions, colonies, and India contributed 3,284,943

men, of whom 202,321 were killed and 428,644 wounded, to defend the empire to which they belonged.

The War not only demonstrated the strength but also enlarged the territorial extent of the Empire. Cyprus, occupied since 1878, and Egypt, occupied since 1882, were declared British protectorates shortly after Turkey entered the conflict in 1914, and were definitely ceded by the latter in the Treaties of Sèvres (1920) and Lausanne (1923), along with Palestine and Mesopotamia over which Great Britain became mandatory, together with the connecting Arabian hinterlands. The former Turkish province of Hedjaz, having declared independence at British prompting during the War, became a veiled protectorate, whose nominally independent king accepted a subsidy and advice from Britain. All except the northwestern corner of German East Africa, a thin slice of the Cameroons, somewhat less than half of Togoland, and the island of Nauru, became British mandates as a result of the peace settlement; but to these should be added the Australian mandate over German New Guinea (Kaiser Wilhelm's Land and Bismarck Archipelago), the New Zealand mandate over German Samoa, and the South African mandate over German Southwest Africa. The mandates gained by Britain and her dominions added 884,500 square miles to the Empire, and if one includes Egypt, Cyprus, and Hedjaz, the total territorial accretion was about 1,300,000 square miles. At the close of the world conflict, the Empire embraced over 2,000,000 square miles and 330,000,000 persons in Asia; over 4,000,000 square miles and 63,000,000 persons in Africa; 4,000,000 square miles and 11,000,000 inhabitants in America; and 3,250,000 square miles and almost 8,000,000 persons in Australasia: a grand total of almost 14,000,000 square miles and nearly half a billion human beings.

So huge an empire proved, in years after the War, to be not an unmixed blessing. Cyprus, the mandates, and several older colonies, presented the harassed taxpayers of England with unwelcome annual deficits to be paid, while the maintenance of occupying forces in Mesopotamia, Persia and elsewhere was almost incredibly expensive. Moreover, the awakened nationalism of backward races strengthened the tendency toward which the need of financial retrenchment pointed. Instead of meeting native demands with bullet and bayonet, Great Britain granted conditional independence to Egypt (q.v.) and to Mesopotamia (q.v.) in 1922, withdrew from Persia (q.v.) and Baku in 1920-21, acquiesced in Afghanistan's (q.v.) reassertion of independence in 1921, and by the Government of India Act of 1919 accorded incomplete satisfaction to the Indian aspiration for "swaraj." Different in motive, but similar in the tendency to diminish rather than expand the Empire's holdings, were the cession to Italy after the War, of the Jarababib strip on the West-Egyptian frontier and of Jubaland (from Northeastern Kenya), and the promise at the Washington Conference to restore Wei-hai-wei to China. With the accession of a Labor government to power in 1924, the decline of aggressive British imperialism was accentuated, for Labor in principle favored extension of self-government for backward peoples and professed immunity from imperialist land-hunger.

While perceptibly loosening her grasp on a

few colonial areas, the mother country significantly readjusted her relations with the great self-governing dominions. Due largely to the personal influence of the South African General Smuts, Downing Street statesmen were brought to realize that the solidarity of the Empire could be strengthened better by placating than by resisting the desire of the dominions for complete autonomy. Accordingly, the dominions and India received separate representation in the Peace Conference (q.v.) and separate membership in the League (q.v.) as quasi-independent states in the proposed Anglo-French alliance, a clause permitting separate adhesion by the dominions was inserted; Canada's request for a separate legation at Washington was conceded, though not actually realized, and in general the principle of independence in international status seemed to be tentatively, and only tentatively, established. It was also believed by some observers that as regards internal affairs Downing Street would adopt General Smuts's principle of complete non-interference, allowing the common sovereign and common loyalty alone to preserve unity. Ireland (q.v.), it should be remembered in this connection, took its place on a par with the dominions under the Free State Treaty of 1921 (which, by the way, substituted the locution "Commonwealth of Nations" for "Empire") and southern Rhodesia was promised responsible self-government in 1923. For authority, Downing Street endeavored to substitute co-operation in its relations with the dominions. In 1917, an Imperial Conference of their representatives, and, significantly, of Indian representatives, was held in London, and simultaneously the dominion premiers were allowed to sit with the War Cabinet, which, for the time being, was considered an "Imperial War Cabinet." At this time it was planned to hold in 1922 a constituent Imperial Conference which would establish a stable constitutional basis for imperial solidarity. The sessions of the Imperial Conference and Imperial War Cabinet in 1918 were interested chiefly in plans to develop empire resources and to prevent foreign control of raw materials after the War. The notable Imperial Conference in 1921 not only considered the proposed renewal of the Anglo-Japanese Alliance (to which Canada objected), and naval defense, but also decided that dominion premiers and Indian representatives should be summoned annually for conference, and that the projected constituent meeting in 1922 would be unnecessary. The seventh Imperial Conference, convening in October, 1923, included the president and minister of external affairs of the Irish Free State, as well as representatives from Canada, Australia, New Zealand, South Africa, Newfoundland, India, and Great Britain. Various questions of foreign policy and imperial defense were discussed, but what chiefly attracted attention was the demand of General Smuts of South Africa, seconded by other dominion spokesmen and reinforced by the Imperial Economic Conference then in session, for effective measures to develop the Empire's natural resources and industries. As it later developed, this plea meant, practically, the adoption by Great Britain of a protective tariff, with preferential rebates for colonial products, which would thus be able to compete victoriously with American beef, grain, cotton, tobacco, and fruits in the English market. How

Premier Baldwin determined to establish a preferential tariff, but was decisively defeated by the British electorate, is told in the article on Great Britain (q.v.). But it should be remarked here that the British election of 1923 marked a definite setback for the movement which had been gaining headway for a generation, especially during the War and since, toward the cementing of imperial ties by tariff preferences, the establishment (after the War) of protective duties in several crown colonies, besides the dominions, the imposition of discriminatory export duties on raw materials (e.g. palm kernels, goatskins, tin)—in short, a system of economic imperialism which, if perfected, would surely arouse envy and resentment among the other industrial nations of the world.

BRITISH HONDURAS. A British crown colony in Central America. Area, 8592 square miles; population in 1921, 45,317 as compared with 40,458 in 1911. Belize, the chief town, had 12,661 inhabitants in 1921. Agriculture continued to engage the population. Chief exports, in 1921, in value of dollars, were bananas, \$169,298; cedar, \$4,494; chicle, \$1,323,967; coconuts, \$142,564; mahogany, \$1,054,165; plantains, \$22,301. The War saw the colony's trade mount, but totals fell again in 1922, as the following reveals: imports for 1913-14, \$3,186,062; for 1922, \$3,290,402; exports for 1913-14, \$3,126,954, for 1920-21, \$5,051,895, for 1922, \$2,817,597. The United States in the decade 1913-23, became the most important factor in the country's trade, taking 71 per cent of her exports in 1922 to Great Britain's 19.38 per cent, and furnishing 57.46 per cent of her imports to Great Britain's 27.38 per cent. In 1923, the country's commerce gained somewhat. By 1922-23, revenues and expenditures almost doubled those of 1913-14. For 1922-23, they were: revenue, \$1,137,529; expenditure, \$1,477,194. The debt in 1923, \$1,073,164, was greater than that of previous years. The attempts to exploit the forests of the country showed little success during the period, for production of cedar, mahogany, and logwood was considerably lower in 1921 than in 1911.

BRITISH ISLES. See GREAT BRITAIN.

BRITISH LABOR PARTY. See GREAT BRITAIN, *History*.

BROAD, CHARLIE DUNBAR (1887-). An English professor of philosophy, born in London, and educated at Cambridge, where he achieved high honors as a student of metaphysical and ethical philosophy. He was successively fellow of Trinity College, assistant professor of logic at the University of St. Andrews, lecturer on logic at University College, Dundee, and professor of philosophy at the University of Bristol. In common with the rest of the so-called Cambridge group, Professor Broad approaches philosophy from the point of view of science. His first work, *Perception, Physics and Reality* (1914), was an attempt to find out what knowledge science gives us about the real world. This investigation is continued in *Scientific Thought* (1923). In both of these he has expounded a theory of perception involving epistemological dualism. In addition to these works he has contributed several articles to *Mind*, *The Hibbert Journal*, *Proceedings of the Aristotelian Society*, and *International Journal of Ethics*.

BROADCASTING. See RADIO TELEPHONY; RENSSELAER POLYTECHNIC INSTITUTE.

BROADCASTING MUSIC. See MUSIC, *Mechanical Reproduction*.

BROCA, BENJAMIN AUGUST (1857-). A distinguished French surgeon, usually spoken of as August Broca, who received his medical degree from the University of Paris. His numerous writings include *Traitement des Tumeurs Blanches chez l'Enfant* (1890); *Traité de Thérapeutique Infantile*, with Legendre (1894); *Sur l'Anatomie Chirurgicale et Chirurgie d'Oreille Moyenne*, translated into English (1901); and *Leçons Cliniques de Chirurgie Infantile* (1902). During the War Broca produced numerous works on military surgery, *Précis de Médecine Opératoire* (1916); *La Prothèse des Amputés en Chirurgie de Guerre* (1917), *Les Séquelles Osteo-articulaires des Plaies de Guerre*, translated into English (1916); *Ligations et Amputations*, English translation (1917), and *Chirurgie de Guerre et Après-guerre* (1921).

BROCK, REGINALD WALTER (1874-). A Canadian geologist, born at Perth, Ont. He studied at Toronto, and later at Heidelberg. Meanwhile he was instructor at the School of Mining in Kingston, Canada, but in 1897 entered the service of the Geological Survey of Canada, of which he was director in 1905-14. In the latter year he was deputy commissioner of mines of Canada and dean of the faculty of applied science in British Columbia. From 1902 to 1914 he had been professor of geology in the School of Mining. As consulting geologist he served in Egypt, and during the War in the Canadian Military forces, with the rank of major. He was a member of many scientific and technical societies and a fellow of the Royal Society of Canada, which he served as general secretary.

BROCKDORFF, BARON CAY VON (1874-). A German writer on philosophical topics. He was educated in the German state universities and became professor of philosophy at the University of Kiel. His philosophical works include *Die Philosophischen Anfangsgründe der Psychologie* (1905), *Die Geschichte der Philosophie und der Problem ihrer Bergreiflichkeit* (1906), *Die Wissenschaftliche Selbsterkenntnis* (1908), *Philosophie und Padagogik* (1912), *Diskontinuität und Dialektik* (1914), *Die Wahrheit über Bergson* (1915), *Hobbes* (1919), and *Schopenhauer und die Nachkantianern* (1919). In his volume on Bergson, which was written during the War, he charged the French philosopher with borrowing his principal ideas from German sources, particularly from Schelling.

BROCKELMANN, KARL (1868-). A professor at the University of Halle (see Vol. IV). In 1917 he published *Die Älteren Vorläufer der Osmanischen Literatur*.

BRODRICK, WILLIAM ST. JOHN F. (VISCOUNT MIDLETON) (1856-). An English statesman (see Vol. IV). He became Knight of the Order of St. Patrick in 1915. In 1917-18 he served on the Irish Convention. He was created First Earl of Midleton, Ireland, and Viscount Dunsford of Dunsford, Surrey, in 1920.

BRONSON, HOWARD LOGAN (1878-). An American physicist, born at Washington, Conn., and educated at Yale. In 1904 he was called to McGill University and remained there

until 1910, when he accepted the Munro chair of physics at Dalhousie. His original work has included studies on radio-activity, high resistance and standard cells, on which he has published valuable papers. He was president of the Nova Scotian Institute of Science, 1918-20.

BROOKE, RUPERT (1887-1915). An English poet, born at Rugby, and educated at Rugby School and King's College, Cambridge, where he later won a fellowship. His first published volume was *Poems* (1911). Two years later he made a trip to America and on to the Samoan Islands, meanwhile writing letters home about his travels. These were published at the time in a London newspaper and have since been published in book form as *Letters from America* (1916), with a preface by Henry James. One other book, *1914 and Other Poems*, published posthumously, and an essay on *John Webster and the Elizabethan Drama* (1916) conclude his short list of contributions to literature. Brooke's writing possessed so much power that lovers of poetry felt sharply the loss to English literature in his premature death on Apr. 23, 1915. He had joined the Naval Brigade early in the War and was on his way to Gallipoli when he became a victim of blood-poisoning. His *Collected Poems*, prefaced by Edward Marsh, were published in 1918.

BROOKLYN INSTITUTE OF ARTS AND SCIENCES. An institution founded in 1824 in Brooklyn, N. Y., and reincorporated in 1890. Until 1917 it was divided into three general departments, education, museums, and the botanic garden, in that year the biological laboratory, founded in 1889 under Institute auspices, became a fourth department of the Institute. The department of education offered courses in a variety of subjects, and also arranged lectures and concerts by prominent men and women and eminent artists. A branch of the Institute was maintained throughout the period at Jamaica, L. I., but the Huntington branch was discontinued in 1921. The receipts rose from \$385,748 in 1917 to \$600,000 in 1923, and the permanent funds from \$942,400 to \$1,639,000. Membership in 1924 was about 10,000, including an enrollment of 600 at Jamaica. The Institute received a bequest of \$61,000 from Mrs. Georgietta Proctor for the work of the departments of physics and engineering, \$10,000 from Mrs. Caroline Mather for its general work, and the final payment of \$20,000 on the Robert B. Woodward bequest. Frank L. Babbott succeeded A. Augustus Healy as president in 1920, and John H. Denbigh became secretary in 1922, succeeding Herman Stutzer.

BROOKLYN POLYTECHNIC INSTITUTE. An institution for the technical education of men founded in 1853. The day registration increased from a total in 1914 of 187, covering all departments, to a total in 1924 of 465, and the evening registration from 514 in 1914 to 1000 in 1924. The graduating class increased from 45 to 102 during the same period. Productive funds rose from \$389,876 to \$586,665, the annual income from \$163,278 to \$221,300, and the value of buildings, grounds and equipment from \$935,292 to \$1,339,281. The laboratories increased from 10 to 27; the one general library became six departmental libraries, i.e. English literature, mathematics, modern languages, mechanical engineering, chemistry, and the Mailloux Electrical Library.

Ten additional fraternities were organized and eight general societies, two new publications were established. The courses were radically revised; two special courses of one year each, three graduate courses, and summer review courses were added. President, Fred W. Atkinson, Ph.D.

BROOKS, ALFRED HULSE (1871-). An American geologist and explorer (see VOL. IV). He was Lieutenant-Colonel of Engineers in 1918, and also chief geologist of the A.E.F., serving in France from 1917 to 1919. He was with the American Peace Commission in February and April, 1919.

BROOKS, CHARLES (1872-). An American plant pathologist, born in Salem, Ind. He graduated from the University of Indiana in 1904 and took graduate courses at the University of Missouri. In 1906 he was instructor of botany at the New Hampshire College, and from 1906 to 1912, professor and botanist of the New Hampshire Agricultural Experiment Station. From 1912 he was pathologist at the Bureau of Plant Industry of the United States Department of Agriculture. He was a member of several scientific societies and in 1917 was vice-president of the Phytopathological Society. He carried on researches in fruit diseases, especially those of apples.

BROOKS, JOHN GRAHAM (1846-). An American author and lecturer (see VOL. IV). He published *Labor's Challenge to the Social Order* in 1920.

BROOKS, VAN WYCK (1886-). An American critic, born at Plainfield, N. J., and educated at Harvard. For a time he was an instructor at Leland Stanford Junior University. In 1920 he came to the *Freeman*, whose literary editor he was until that excellent periodical suspended publication in 1924. Early works published were: *The Wine of the Puritans* (1909); *The Malady of the Ideal* (1913), and *John Addington Symonds* (1914). With the appearance of his *America's Coming-of-Age* (1915) it at once was apparent that Mr. Brooks, better than any one else in his generation, had placed his fingers on the reason for America's æsthetic sterility. His appreciation of the material and moral conditioning influence of the frontier on the development of American cultural life was a discovery of the first importance. His *Ordeal of Mark Twain* (1919) and his papers on Henry James published in the *Dial* (1923), really developments of the same theme, were by many considered the most important critical works of the period. For the latter he received the *Dial* prize for 1923.

BROOKS, WILLIAM PENN (1851-). An American agriculturist, born at South Scituate, Mass., and educated at the Massachusetts Agricultural College and in Germany. From 1877 to 1887 he was on the faculty of the Imperial College in Japan and for several years acted as its president. From 1889 to 1906 he was on the faculty of the Massachusetts Agricultural College. In 1889 he became director of the Massachusetts Agricultural Experiment Station and also acted after 1918 as consulting agriculturalist. He was a member of several scientific societies and contributed many reports on agricultural subjects to their proceedings. He wrote *Agriculture* (1901) and *General Agriculture, Dairying and Poultry Farming*.

BROSSART, FERDINAND (1849-). An American bishop of the Roman Catholic Church, born in Germany, and educated at St. Francis College, at Mt. St. Mary Seminary (Cincinnati), and in Belgium at the College of St. Nicolas and the University of Louvain. From 1872 until 1916 he was rector in various towns in Kentucky or vicar general of the diocese of Covington. He became bishop of Covington in 1916. He translated several theological works from the German of Denifle, Meyenberg, and Schaeffer.

BROUGHTON, RHODA (1840-1920). An English novelist (see VOL. IV). She died at Headington on June 5, 1920. Her latest novels include *Concerning a Vow* (1914; 6th ed., 1920), *A Thorn in the Flesh* (1917), *A Fool in her Folly* (1920).

BROWN, HEYWOOD (CAMPBELL) (1888-). A newspaper columnist and author, born in Brooklyn, N. Y., and educated at Harvard. He was connected with the *Morning Telegraph* (1908-09; 1910-12), the *New York Tribune* (1912-21), and the *New York World* (1921-). He is the editor of the column "It Seems To Me" in the *World*. Heywood Brown has made himself known as a breezy and outspoken humorist, with now and then a guarded philosophy breaking the surface of his mirth. He is the author of *American Expeditionary Forces—with General Pershing and the American Forces* (1918); *Seeing Things at Night* (1921); *The Boy Grew Older* (1923), and *The Sun Field* (1923).

BROWN, ALICE (1857-). An American author (see VOL. IV). Her later books include *Children of Earth* (1915); *Bromley Neighborhood* (1917); *The Prisoner* (1916); *The Flying Teuton* (1918); *Homespun and Gold* (1920); *The Wind Between the Worlds* (1920); *One-Act Plays* (1921); *Louise Imogen Guiney—a Study* (1921); *The Old Crow* (1922); and *Ellen Prior*, verse (1923).

BROWN, ARTHUR JUDSON (1856-). An American clergyman and author (see VOL. IV). He has written *The Why and How of Foreign Missions* (rev. ed., 1921), *Unity and Missions—Can a Divided Church Save the World?* (1915), *Rising Churches in Non-Christian Lands* (1915), *Russia in Transformation* (1917), and *The Mastery of the Far East* (1919; rev. ed., 1921).

BROWN, CHARLES REYNOLDS (1862-). An American clergyman (see VOL. IV). In 1920 he was Ingersoll lecturer on immortality at Harvard University, and in the same year published his lectures under the title *Living Again*. He is also the author of *The Healing Power of Suggestion* (1916), *Five Young Men* (1917), *Who Is Jesus Christ?* (an address, 1917), *The Master's Way* (1919), *Story Books of the Early Hebrews* (1919), *Yale Talks* (1919), *The Religion of a Layman* (1921), *Social Rebuilders* (Mendenhall Lectures, 1921), *The Honor of the Church* (1922), *Lincoln, the Greatest Man of the Nineteenth Century* (1922), *The Art of Preaching* (Yale University Lyman Beecher Lectures, 1922), and *The Larger Faith* (1923).

BROWN, DEMETRA KENNETH (DEMETRA VAKA) (1877-). A Greek-American author, born on the Island of Bouyouk Ada, Sea of Marmora. Her early life was passed in close touch with the Turkish people, but many of their customs revolted her, especially the pre-

arranged marriages. She ran away from home to escape such a marriage, and came to the United States with the family of a relative. She joined the staff of the Greek newspaper *Atlantis* in New York City, but after six months of this, she gave up journalism and became a teacher of French at the Comstock School (New York), where she remained until 1903, except for a short interval in 1901 when she returned to Turkey for a visit. In 1904 she was married to Kenneth Brown, (q.v.) novelist, and soon began to write. Her second book, *Haremlik*, published in 1909, commanded wide attention. It consisted of 10 studies of Turkish women. *A Child of the Orient* (1914) relates the story of the author's own childhood. Other books of hers include *The First Secretary* (1907); *The Duke's Price* (1910); *Finella in Fairyland* (1910); *In the Shadow of Islam* (1911); *The Grasp of the Sultan* (1916); *The Heart of the Balkans* (1917); and *In the Heart of German Intrigue* (1918), which grew out of interviews with King Constantine.

BROWN, ERNEST WILLIAM (1866-). An American mathematician (see Vol. IV). He was president of the American Mathematical Society from 1914 to 1916. In 1920 he published *Tables of the Motion of the Moon*.

BROWN, FRANK CHOUTEAU (1876-). An American architect, born at Minneapolis, Minn., and educated at the Minneapolis School of Fine Arts and the Boston Art Club and in Europe. In 1902 he began practice in Boston and from 1907 until 1919 was editor of the *Architectural Review*. In 1916 he became a member of the faculty of Boston University and in 1919 head of the department of art and architecture. His publications include *Letters and Lettering* (1902); *The Orders of Architecture* (1904); *New England Colonial Houses* (1915); *Modern English Churches* (1917); and *The Brick House* (1919).

BROWN, GLENN (1854-). An American architect, born in Fauquier County, Va., and educated at Washington and Lee and George Washington Universities and the Massachusetts Institute of Technology. He began practice in 1878, and was admitted to membership in important architectural societies of Europe and America, as well as to the American Academy in Rome and the National Institute of Arts and Letters. His publications include *Healthy Foundations for Houses* (1885); *Trap Syphonage* (1886); *A History of the United States Capitol* (1900); *Papers on the Improvement of Washington City* (1901); *Personal Recollections of Charles F. McKim* (1916), and *Roosevelt and the Fine Arts* (1919). He was also the editor of several series, among them being the *Proceedings of the American Institute of Architects* (1899-1909).

BROWN, KENNETH (1868-). An American author and journalist (see Vol. IV). In 1917 he went with his wife to study the Greek situation; together they published *In Pawn to a Throne* (1919). He is also author of *Putter Perkins* (1923). See BROWN, DEMETRA.

BROWN, PHILIP MARSHALL (1875-). An American educator and diplomat, born at Hampden, Me., and educated at Williams College. In 1900-01, he served as secretary to Lloyd C. Griscom and from 1901 to 1903 was second secretary for the American Legation of Constantinople. He served as Secretary of Le-

gation to Guatemala and Honduras, 1903-07, and as secretary of the American Embassy of Constantinople, 1907-08. From the latter year to 1910 he was minister to Honduras. Resigning from the diplomatic service, he was appointed instructor in international law at Harvard University in 1912 and in the following year became assistant professor of international law and diplomacy at Princeton, where he was later appointed professor of international law (1915). He was associate editor of the *American Journal of International Law* and was an associate member of the Institute of International Law at Brussels. He was the author of *Foreigners in Turkey* (1914), *International Realities* (1917), *International Society* (1923), etc.

BROWN, PRESTON (1872-). An American army officer, born in Lexington, Ky. He graduated from Yale in 1892 and in 1904 entered the army as a private. He was commissioned 2d lieutenant in 1897 and rose through the various grades; he became a major in 1916 and a lieutenant-colonel in 1917. In 1918 he was appointed colonel of the national army and in August of the same year was promoted to be brigadier-general. He served as Chief of Staff in the 2d division at Château-Thierry and St. Mihiel in 1918, and was Chief of Staff for the 4th army corps. In August, 1918, he was appointed Commanding General of the 3d division, serving in that capacity through the battle of Meuse-Argonne. In November, 1918, he became Assistant Chief of Staff at General Headquarters in the occupied German territory. He was appointed instructor in the Army General Staff College in 1919. He was awarded the Distinguished Service Medal for Exceptional Service for his work as Chief of Staff and in other capacities. In 1921 he was acting commander of the Army War College and in the same year appointed Commanding General of the third infantry brigade.

BROWN, ROY STUART (1888-). A major in the United States air service, born in Minneapolis. He was in charge of pilots' schools and experimental work during the War. In 1919-21 he saw service in the Philippine Islands.

BROWN, WILLIAM ADAMS (1865-). An American theologian (see Vol. IV). He was acting provost of Yale University, 1919-20. From 1917 to 1919 he was Secretary of the General War-time Commission of the Churches. He was also chairman of the committee on the War and religion, and a member of the committee of the *Outlook*, the Committee of Fourteen, and the administrative committee of the Federal Council of Churches of Christ in America. He is the author of *Modern Theology and the Preaching of the Gospel* (1914), *Is Christianity Practicable?* (1916); *Modern Missions in the Far East*, privately printed (1917); *Christianity and Industry*, addresses (1919); *Minister as Teacher*, lectures (1920), and *The Church in America* (1922).

BROWNE, EDWARD GRANVILLE (1862-). An English professor (see Vol. IV). He is the author of *The Press and Poetry in Modern Persia* (1914), *Maternal for the Study of the Bâbi Religion* (1918); *The Persian Constitutional Movement* (1918), a continuation of his *Literary History of Persia* (1920); *Literary History of Persia*, vol. ii, 3d ed. (1921); *Translation*

of *Chatâr Magâta*, with notes (1921); and *Arabian Medicine* (1921).

BROWNE, GEORGE ELMER (1871-). An American artist born at Gloucester, Mass., educated at the School of Drawing and Painting, the Museum of Fine Arts and Cowles Art School (Boston) and was a pupil of Jules Lefebvre and Robert Fleury in Paris. He was elected an Associate of the National Academy in 1919. Mr. Browne's canvases are broad in treatment and his manner very energetic. His pictures have been exhibited throughout Europe and the United States. In 1904 the French government bought his painting, "The Bait Sellers of Cape Cod," from the Salon. A collection of nine lithographs is in the New York Public Library. "The Wain Team" is in the National Gallery at Washington.

BROWNE, MAURICE (1881-). A theatrical director and dramatist, born in England, and educated at Cambridge. He came to the United States in 1910 and founded, with Ellen Van Volkenburg, the Chicago Little Theatre, in 1912. His most recent books include *The Rhythmic Drama* (1914) and *The King of the Jews*, a tragic drama (1916).

BROWNE, PORTER EMERSON (1879-). An American novelist and playwright, born in Beverly, Mass. He began writing short stories, verse, and essays in 1901. He was one of the founders of the Vigilantes in 1916. Among his plays are *A Fool There Was* (1906), *The Spendthrift* (1908), *A Girl of To-day* (1915), and *The Bad Man* (1920). He also wrote of the one-act plays, *A Hero, In and Out, Married*, etc. Other works of his are *A Fool There Was*, a novel (1908); *Peace at Any Price* (1916); *Stars and Stripes* (1917), and *Some one and Somebody* (1917).

BROWNELL, WILLIAM CRAWY (1851-). An American author (see VOL. IV). He has written *Criticism* (1914), *Standards* (1917), and *American Prose Masters* (new edition, 1923).

BROWNING, OSCAR (1837-1923). An English author and lecturer. (See VOL. IV). He became Fellow of the Arcadia Academy, Rome, in 1918. In 1921 he was made trustee and chairman of the British Academy of Arts in Rome. He is the author of *A History of Medieval Italy, 568-1530* (1914), *A General History of Italy* (1915), *History of the Modern World* (popular edition, 1916), and *Memories of Later Years* (1923).

BROWN-TAIL MOTH. See ENTOMOLOGY, ECONOMIC.

BROWN UNIVERSITY. An institution at Providence, R. I., founded in 1764. It increased in enrollment during the decade 1914-24 as follows: Undergraduate men students from 910 in 1914 to 1233 in 1924; graduate students from 102 to 157; students in the Women's College, which is entirely separate, from 203 in 1914 to 370 in 1924; students in the School of Education, instituted in 1916, 51; and extension students from 360 to 1606 in 1924. In 1919, the university liberalized the entrance requirements by modifying the language and mathematics requirements and increasing the number of electives, and made compulsory a comprehensive psychological test. The faculty was increased in membership during the decade from 77 to 113; \$4,015,000 was added to the endowment, bringing the total to \$8,291,983; the library was increased by approximately 68,

000 volumes, making the total 292,827, including the McClellan Collection of Lincolniana given in 1922. The Arnold Biological Laboratory was built in 1915; the Soldiers' Memorial Gate in 1919; and the Jesse Metcalf Chemical Laboratory in 1923. At the Women's College, Metcalf Hall was completed in 1919. In 1924, the university began the construction of a new stadium, baseball field, and extensive facilities for baseball, football and tennis. Funds were also available and the plans under consideration in 1924, under a gift from the estate of the late John R. Hegeman, for the erection of Hegeman Hall, a new dormitory, and under the gift of Edgar L. Marston, for the erection of the Marston Modern Language Building. In 1924, William H. P. Faunce, D.D., LL.D., completed 25 years of service as president of the university.

BRUCE, ANDREW ALEXANDER (1866-). An American jurist, born at Nunda Drug in the Madras Presidency of India, and educated in England, and at the University of Wisconsin. He practiced law in Chicago from 1893 to 1898 and in the latter year was appointed assistant professor of law at the University of Wisconsin. In 1902 he was appointed professor of law at the University of North Dakota and from 1904 to 1911 acted also as dean of the College of Law. He was appointed associate justice of the Supreme Court of North Dakota in 1911 and served until 1916, when he became chief justice. In 1919 he was appointed professor of law at the University of Minnesota. He was a member of the Committee of the American Bar Association which investigated on the report of court martial proceedings in the United States army in 1919. He was the author of *Property and Society*, (1916), *Non-Partisan League* (1921), and *The Law of Bailments*, and was a frequent contributor on legal subjects to magazines and newspapers.

BRUCE, DONALD (1884-). An American forester, born at Newtonville, Mass., and educated at Yale University. He graduated from the Yale School of Forestry in 1910. From that year until 1916 he was forest assistant, forest examiner, and forest professor of the United States Forest Service. He was professor of forestry at the University of California from 1915. He wrote on subjects of forest engineering.

BRUCE, (HENRY) ADDINGTON (BAYLEY) (1874-). An American author (see VOL. IV). In 1916 he resigned as staff contributor to the *Outlook*. In 1915 he became psychological adviser to the *Associated Newspapers*. He is the author of *Adventurings in the Psychical* (1914), *Sleep and Sleeplessness* (1915), *Psychology and Parenthood* (1915), *The Riddle of Personality* (new and revised edition, 1916), *Handicaps of Childhood* (1917), *Nerve Control and how to Gain It* (1918), and *Self-Development* (1921). He has edited *The Education of Karl Witte* (1914) and the *Mind and Health Series of Medical Handbooks* (1915).

BRUCE, STANLEY MELBOURNE (1884-). A premier of Australia. He was educated at Cambridge and served with distinction in the War from 1914 to 1917, being twice wounded. In 1918 he was elected to the Australian Parliament and represented his country before the League of Nations in 1921. He succeeded William M. Hughes as premier in 1923.

BRUCE, WILLIAM SPIERS (1867-1921).

Scottish explorer and scientist (see Vol. IV). Between 1912 and 1920 he made four scientific voyages to Spitzbergen, on which region he was an acknowledged authority.

BRUCE-JOY, ALBERT (1842-1924). An Irish sculptor (see Vol. IV), whose later ideal subjects include: "Thetis and Achilles," "The Pets," "The Cricketer," "The Fencers," "Tennis" and "The Boy Scout."

BRUNE, ADOLPH GERHARD (1870-). An American composer, born at Bakkum, Germany. He received his first instruction from his father and then studied organ with E. Brennecke in Osnabrück. In 1889 he went to Peoria, Ill., where he remained five years as organist of St. Joseph's and the Cathedral. He then moved to Chicago and after further study there under E. Liebling (piano) and B. Ziehn (composition) was appointed professor of piano and composition at the Chicago Musical College in 1898, a position he still held in 1924. Included among his works are three symphonies (E flat, E minor, and D); three symphonic poems, *Lied des Singschwans*, *Evangeline*, *Ein Dämmerungsbild*; four overtures; *Symphonic Fantasy* in C; variations on a theme by Beethoven; *A Fairy Tale*; two concertos for piano and orchestra, in C minor and F minor; a concerto for organ and orchestra in E flat minor; *Jerusalem*, a cantata for mixed voices and orchestra; two male choruses with orchestra, *Sangers Fluch* and *Sawons' War Song*; a Mass, six parts à cappella; Psalm 84 for ten parts; five string quartets; two string quintets; a string sextet; and numerous works for organ and for piano.

BRUNEL. See STRAITS SETTLEMENT.

BRUNSCHVIG, LÉON (1869-). A French philosopher born at Nantes. On the death of Lachelier and Boutroux he became the recognized leader of the French school of critical idealists. Accepting from Boutroux the notion of the contingency of the laws of nature and from Lachelier the belief in the primacy of the act of judgment, he has transformed the legacy of his masters into a modern philosophy of science standing equidistant from pure empiricism and from ontological rationalism. Brunschvig was educated at the Ecole Normale Supérieure and won a prize from the Academy of Moral and Political Science in 1891 for a memoir on Spinoza. This youthful work, subsequently revised and expanded by the most painstaking scholarly research, has gone through several editions, and has earned for its author the reputation of one of the keenest modern interpreters of Spinozism. Through his interest in the philosophy of the seventeenth century he was led to undertake a commentary on Pascal and published an edition of the *Pensées* in three volumes and the complete works in 14 volumes. His philosophic reputation rests chiefly on two volumes on the philosophy of mathematics and of science. After ascending the regular academic ladder, Brunschvig was called to the Sorbonne in 1914. In 1920 he was elected to the Academy of Moral and Political Science, and in 1923 he was nominated to the Legion of Honor. His works include *Spinoza* (1894), *Cambronne* (1894), *La Modalité du Jugement* (1897), *Pensées et Opuscules de Pascal* (1897), *Introduction à la Vie de l'Esprit* (1900), *L'Idealisme Contemporain* (1905), *Etapes de la Philosophie Mathématique* (1912), *Nature et Liberté* (1921), *L'Expérience Humaine et la Causalité Physique* (1922), *Spinoza et ses Con-*

temporains (1923), and *Œuvres de Pascal* (1904-14).

BRUNTON, SIR THOMAS LAUDER (1844-1916). A distinguished British physician who devoted much of his time to original research in physiology and pharmacology. Born in Bowdon, Roxburghshire, he was educated at the University of Edinburgh. He spent years on the Continent, at Vienna, Berlin, Leipzig and other medical centres, in the study of drug action, physiological chemistry and physiology. With St. Bartholomews he discovered the medical uses of amyl nitrite. As early as 1874 he tested a muscle extract on a diabetic patient and thus claimed priority in the use of internal secretions. His principal writings are *On Digitalis*, his graduation thesis (1868); *Tables of Materia Medica* (1877); *Textbook of Pharmacology, Therapeutics and Materia Medica* (1885); *On Disorders of Digestion* (1886); *Lectures on the Action of Medicines* (1897); *Index of Diseases and Remedies* (1890), translated into German, Italian and Russian; *Disorders of Assimilation and Digestion* (1901), *Therapeutics of the Circulation* (1908); and *Collected Papers on Circulation and Respiration* (1916). He was knighted in 1900 and made a baronet in 1908.

BRUSLOFF, ALEXEI ALEXEIVITCH (1853-1926). A Russian general, born at Kutais in the Russian Caucasus. He came from a family long distinguished in Russian military and political life. Having been educated for the Russian army, he embarked on a career of unvarying success. By 1910 he had risen to the rank of corps commander and at the outbreak of the War he was elevated to head the Russian eighth army. He distinguished himself in Galicia first in 1914 and 1915 and again in the great Russian victories of 1915-16. With the Russian Revolution, he accepted Bolshevism, tacitly at any rate, and was for a time reported to be in command of the Red armies. He never approved of the operations of Kolchak, Denikin, Yudenich, and Wrangel, but valued the welfare of the Russian nation more than any one faction. For a time he was at work in creating a militia system for Russia. He soon retired to his stud farm near Moscow and in 1924 was living in seclusion.

BRUSSELS CONFERENCE. See REPARATIONS.

BRYAN-CHAMORRO TREATY. See NICARAGUA.

BRYAN, CHARLES W. (1867-). An American politician, born at Salem, Ill. He is the younger brother of William Jennings Bryan. He was educated in the public schools and for a short time read for the bar but soon relinquished these studies to take up farming. For many years he was associated with the political activities of his more distinguished brother, to whom he was personal adviser, business manager, and assistant in the editing of *The Commoner*. As his brother's interests in Nebraskan politics declined, Charles W. Bryan's correspondingly increased, so that at one time or another he was mayor of Lincoln, member of its council, and street commissioner. In 1922 he ran for governor of Nebraska and carried that normally Republican State by a majority of 50,300. It was because he had in this campaign the support of the Farmer-Labor party, the "Big Four" railway brotherhoods, and unorganized labor, that he was tendered the nom-

ination for the vice-presidency of the United States by the Democratic national convention in July, 1924.

BRYAN, ELMER BURRITT (1865-). An American university president (see Vol. IV). On his resignation from the presidency of Colgate University he became president of Ohio University in 1921.

BRYAN, NATHAN PHILEMON (1872-). An American judge (see Vol. IV). He became judge of the United States Circuit Court of Appeals, fifth judicial circuit, in 1920.

BRYAN, WILLIAM JENNINGS (1860-1925). Ex-Secretary of State of the United States (see Vol. IV). He resigned as Secretary of State on June 9, 1915. In 1918 he became president of the National Dry Federation. He is the author of *The Making of a Man* (1914), *Man* (1914), *A Message from Bethlehem* (1914), *The People's Law* (1914), *The Price of a Soul* (1914), *Royal Art* (1914), *The Value of an Ideal* (1914); *Prohibition*, an address (1916); *The War in Europe and Its Lesson for Us* (reprinted, 1916), *World Peace*, a debate with William Howard Taft (1917), *The First Commandment* (1917), *Heart-to-heart Appeals* (1917), *The Menace of Darwinism, and the Bible and Its Enemies* (1921), and *In His Image* (James Sprunt Lectures, 10th series, 1922).

BRYAN, WILLIAM LOWE (1860-). An American psychologist and university president, born at Bloomington, Ind., and educated at the Universities of Indiana, Berlin, Paris, and Wurzburg. He taught philosophy as a member of the faculty of the University of Indiana (1885-), and in 1893 became vice-president and in 1902 president of the university. In 1910 he was chosen trustee of the Carnegie Foundation. His principal professional contributions to psychology have dealt with the development of motor ability and the psychology of occupations.

BRYCE, JAMES (1838-1922). An eminent English writer and diplomat (see Vol. IV). During the War he exercised great influence in favor of the Allies and was chairman of a committee to investigate the charges of outrages in Belgium and France by the Germans. He was an ardent supporter of the League of Nations. During his later years he was engaged in writing a book on *Modern Democracies* which was published in 1921. It is a comparative history of several democratic governments.

BYRN MAWR COLLEGE. A nonsectarian institution for the higher education of women at Bryn Mawr, Pa., founded in 1880. Throughout the decade between 1914 and 1923-24, the student enrollment and the number of members of the teaching staff remained about the same; in the latter year the registration was 468 and the faculty numbered 64. The number of volumes in the library increased from 74,293 volumes in 1914 to 101,900 volumes in 1923-24, and the productive funds of the college were increased from \$1,184,323 to \$5,753,560.87, largely as the result of an endowment campaign carried on 1918-20. A summer school for women workers in industry was opened in 1921 under the direction of a committee composed of an equal number of representatives of the college and of women workers in industry. A department of music was established in 1921 in the winter session of the college. M. Carey Thomas, Ph.D., resigned from the presidency of the college, which she had held for 28 years, in 1922,

and was succeeded in office by Marion Edward Parks, Ph.D.

BRYUSOV, VALERY J. (1873-). A Russian Bolshevik poet, novelist, and critic, born in Moscow. With Balmont (q.v.) he was one of the leading Decadents and helped found the Modernist school. Also, like Balmont, he was strongly influenced by Poe's works, both prose and verse. His first verses, published in 1894, show an affinity for the French Symbolists, but in his later works, which include excellent critical studies, he expresses his real character better. He writes of the modern industrial city. Using Pushkin as his model, he emphasizes the horrible. He was editor of *The Scales* during its entire existence and subsequently became director of the literary section of *Russkaja Mysl*. The character of public criticism of him swerved from laughter and ridicule to admiration, and eventually Bryusov was recognized as a master of classical literature. His works include *Stephanos* (1905); *The Axis of the Globe*, short stories and plays (1907); *The Flaming Angel*, a novel (1909); and *The Far and Near*, two volumes of essays. His complete works in 25 volumes were published in 1912. He is the translator of numerous foreign poets, including Verlaine, Maeterlinck, D'Annunzio, Oscar Wilde, and Verhaeren.

BUBER, MARTIN (1878-). A Jewish author and scholar, born in Vienna. His principal works are *Die Geschichte des Rabbi Nachman* (1906), *Die Legende des Balaichem* (1907), *Ekstatische Konfessionen* (1908), *Reden und Gleichnisse des Tschuang-Tse* (1910), *Drei Reden über das Judentum* (1911), *Daniel* (1913), *Vom Geiste des Judentums* (1915), *Die Jüdische Bewegung* (1917), *Die Rede, die Lehre und das Lied* (1917), *Worte an die Zeit* (1919), *Cheruth* (1919), *Der Heilige Weg* (1919), and *Der Grosse Maggid* (1921). Buber edited the *Kalevala* and identified himself with *Die Gesellschaft*.

BUBONIC PLAGUE. It has been supposed that this disease is primarily endemic among rats and that man is secondarily infected from the rodent but recent experience with the plague in Africa shows that although this may be the rule, the reverse may be seen, man carrying the infection to man and the rat becoming infected only after some time has elapsed. In regard to man-to-man diffusion, it is an error to believe that a victim of plague is too ill to travel long distances. Photographs of plague patients may show vigorous looking men with no other apparent anomaly than the large swellings in the groins, which of course are not visible in the clad man. In this connection it may be reaffirmed that plague in the bubonic form is not necessarily dangerous to a community of whites even in a plague focus in a tropical city. When, as often happens, isolated cases appear in the cities of the temperate zone, as has been the case in the United States, Great Britain, France, and elsewhere, there seems little tendency to diffusion. Nevertheless there is every reason for promptly stamping out the disease wherever it gains a foothold, for the pneumonic form may develop from the ordinary bubonic form and the disease then becomes highly contagious and highly fatal. Even the ordinary bubonic form may have its virulence intensified and the disease may spread to different kinds of rodent and thus become a permanent menace.

The close similarity in some respects between

plague-pneumonia and influenza-pneumonia gave rise to the belief that the influenza pandemic of 1918 with its huge percentage of pneumonic complications was nothing but plague-pneumonia. It was pointed out that in both affections the high mortality came not so much from the immediate cause of the disease as from the superadded infection from the ordinary streptococcus and pneumococcus and that in both diseases there was a similar type of bronchopneumonia. The best way of exploding this parallelism is by study of the epidemiology of the two diseases, both of which occurred but a few years apart in the large city of Dakar, in West Africa. In 1914-15, a severe epidemic of plague occurred in this locality. It was originally of the pneumonic form and had been brought from a distant focus by persons unknown. But throughout it was limited to certain quarters of the town, certain streets and even certain houses. Quarters inhabited by Europeans only were spared entirely. The disease lingered for eight months, despite the most vigorous measures to combat it. About four years later the same city was visited by the influenza pandemic, which had probably been brought to it by European steamers. It diffused itself quickly, attacking all quarters of the town and black and white indifferently and ran its course rapidly, becoming extinct within a very short time. See INFLUENZA.

BUCHAN, JOHN (1875-). An English author, born at Perth, and educated at Glasgow University and Brasenose College. He received the Newdigate Prize in 1898. In 1901-03, he was private secretary to Lord Milnor, then the High Commissioner of South Africa, and in 1906 joined the Edinburgh publishing firm of Thomas Nelson and Company. In the War he was on the headquarters staff of the British Army in France (1916-17) and was later made an Officer of the Crown of Belgium and the Crown of Italy. His early publications, which include *The African Colony* (1903) and *A Lodge in the Wilderness* (1906), are obviously based on his life in Africa early in his career. Among his later publications are some exceptionally well-written novels and accounts of the War, particularly a *History of the Great War* (1921-22; 4 vols., 1923). The last mentioned is an effective summary of its gigantic subject.

BUCHAREST, TREATY OF, MARCH, 1918. See RUMANIA

BUCHER, KARL (1847-). A German historian and economist, born in Kirberg. He studied history, philology, and economy at Bonn and Göttingen and was professor at the universities of Dorpat, Basle, and Karlsruhe, and rector at Leipzig. He is the author of many works on economic and social topics, among them *Die Aufstände der Unfreien Arbeiter* (1874), *Die Frauenfrage im Mittelalter* (1882), *Die Gewerblichen Betriebsformen in Ihrer Historischen Entwicklung* (1892), *Arbeit und Rhythmus*, 5th ed. (1919), *Der Deutsche Buchhandel und die Wissenschaften* (1904), *Das Zeitungswesen* (1911), *Der Deutsche Kaufmann und die Handelshochschule* (1911), *Unsere Sache und die Tagespresse* (1915), *Das Städtische Beamtentum im Mittelalter* (1915), *Die Deutsche Tagespresse und die Kritik* (1917), *Der Sozialismus* (1919), and *Lebenserinnerungen* (1919).

BUCHHORN, JOSEF (1875-). A German writer, born at Cologne. He has been con-

nected with various newspapers and has published *Die Hohenstauffen*, a novel (1908); *Lug- insland*, a volume of sketches of the lower Rhine (1909), the plays, *Studenten* and *Sehnsucht* (1918); the comedy, *Der Schuifer von Jena* (1920); some volumes of war verse, *Deutsche Jugend*, *Wach' Auf* (1917); *Der Deutsche Zeitspiegel* (1920); and numerous works of a militant character, like *Wir Vergessen zu Leicht* (1917), *Zwischen Goethe und Scheidemann* (1919), *Politik und Presse* (1919), *Bekenntnisse* (1920), *Hindenburg, der Führer in Unsere Zukunft* (1920), *Lasst uns vom Reiche Zeugen* (1921), etc.

BUCHNER, MAX (1881-). A German writer, born at Munich. He studied at the university, specialized on the history of the Carolingian period, and wrote, among other works, *Eine Humanistische Lobrede auf Kilian von Bibra* (1908), *Entstehung und Ausbildung der Kurfürstenfabel* (1912), *Bayerns Teilnahme an den Deutschen Königs wählen* (1913), *Grundlagen der Beziehungen zwischen Landeskirche und Thronfolge im Mittelalter* (1913), *Biographie des Aldrich* (1914), *Zum Briefwechsel Einharths und des Anseigs* (1918), and *Einhard als Künstler* (1919).

BUCK, BEAUMONT BONAPARTE (1860-). An American army officer, born in Mayhew, Miss. He graduated from the United States Military Academy in 1885 and was commissioned second lieutenant in the same year. During the Spanish-American War he served as major of the 2d Texas infantry. He was appointed captain in the regular army in 1899 and in 1914 was commissioned lieutenant-colonel of infantry. He became a colonel in 1916 and brigadier-general of the national army in 1917. He commanded the 28th Infantry of the 1st division of the American Expeditionary Force in 1917, and in the same year was given command of the 2d infantry brigade of the 1st division. In 1918 he was appointed commander of the 34th division and participated in the first all-American offensive in 1918. He also took part in all the other major campaigns of the American troops in France. In November, 1918, he returned to the United States and was appointed commander of Camp McArthur. He served as commander of various other camps and departments and in 1921 became acting chief of staff with the 90th division of organized reserves.

BUDGET, AMERICAN. See FINANCE AND BANKING.

BUFFALO. A city of New York, the second of the State in population and one of the Great Lakes ports. The population increased from 423,715 in 1910 to 506,775 in 1920, and to 545,273 by estimate for 1924. The industries of the city numbered 2225 in 1914; in 1924 nearly 2500 (estimated). The number of wage earners increased from 54,416 in 1914 to 75,899 in 1919, while the value of the product increased from \$247,516,000 in 1914 to \$634,410,000 in 1919. After 1920 several new flour milling companies, which increased the annual output of flour approximately from 6,000,000 barrels to 10,000,000, were added to the city's industries. The capacity of its grain elevators, all of modern construction, was enlarged to 32,000,000 bushels. The city also increased in the decade as a steel, iron, copper, and brass centre, and during and following the War it became the largest airplane manufacturing city, the largest aniline

producing centre, and one of the most important rubber and tire centres of the country. The city developed its commerce in the 10 years to such an extent that in 1924 it was the third largest port in the country, the second largest inland port in amount of tonnage, and the fifth port in foreign commerce. The growth of industry forced the greater utilization of the hydro-electric power resources of Niagara Falls, so that by 1924 more than 95 per cent of the power used was from that source. The assessed valuation of property increased from \$346,560,790 in 1914 to \$768,821,091 in 1924. Bank clearings increased from approximately \$500,000,000 to \$2,500,000,000. The number of dwellings erected within the limits of the city increased from 2007 in 1914 to 3615 in 1923.

Several important municipal improvements were effected in this period. A tunnel 6500 feet long was bored to carry the water from Lake Erie to the city's new pumping station, and a new water purification plant was built at a cost of \$4,000,000. A high pressure system for fire protection was installed in the business districts. The outer harbor was improved during the decade; the Buffalo River was deepened and enlarged upstream, and a new drawbridge, permitting the passage of large vessels, was built. In 1924 the city had 37.4 miles of water front.

Many new office buildings and other structures were completed. These included hotels, apartment houses, the Buffalo Athletic Club, the new Elks Club Building, the Liberty Bank Building, the Saturn Club, the largest normal school in the State, the National Sciences Museum, seven branch libraries, and new bath buildings. Two water front parks were constructed by reclaiming land from Lake Erie and Niagara River. The New York Barge Canal system, which had its western terminus in Buffalo, was provided in the decade with two large terminals at which the largest lake freighters transferred their cargoes.

In 1916 the city adopted the commission form of government. It provided for a council, composed of the mayor and four commissioners elected at large on a nonpartisan ticket for four-year terms. The mayor is head of the department of public safety; the other departments are finance and accounts, public affairs, public works and parks, and public buildings. See GARBAGE AND REFUSE DISPOSAL.

BUILDING. See CITY PLANNING.

BUKOVINA. Formerly a crownland of Austria, but since November, 1918, a Rumanian province. Area, 4031 square miles; population in 1910, 800,098; estimated population in 1922, 689,907. In spite of Austrian occupation since 1777, the population was largely Rumanian and Ruthenian. The Rumans, numbering about 275,000 in 1910, had spread north from their plain country; the Ruthenians, 300,000 in 1910, had moved south from Galicia. The rest were Germans. Among all these there were some 100,000 Jews. The largest town, Cernauti (Czernowitz), had an estimated population of 100,000 in 1920. The inhabitants, densely settled on the land, devoted themselves to agriculture and its by-products, the most important industries being brewing and flour milling. The cultural level of the people was low, and illiteracy was higher there than in any other of the former Austro-Hungarian crownlands except Dalmatia. There were, in 1920, 400 miles of railway. Late in 1918, when the fall of the

Austrian monarchy seemed imminent, the people expressed their desire for reunion with Rumania, only the Ruthenians, who indeed were in a plurality, dissenting because of their traditional friendship with Austria. The Treaty of St. Germain allocated almost the whole province to Rumania except for a small territory in the north crossed by the railroad running from Zaleszczyki to Kolomea and including a railroad junction, which was given to Poland. In 1920, Bukovina's national council was dissolved and a provincial government was erected, drawing its powers from the central government. Bukovina was represented by 19 senators and 16 deputies in the Rumanian parliament.

BULGARIA. A European kingdom situated in the Balkan Peninsula. Area in 1923, 40,667 square miles; in 1914, 43,305 square miles. The census of Dec. 31, 1920, recorded 4,861,439 inhabitants. By the census of 1910 there were 4,337,513 inhabitants to which were added 130,000 people in 1913, as a result of the territorial gains of the Balkan wars. By the Treaty of Neuilly, Bulgaria was compelled to cede to Jugo-Slavia the following districts on its western front: Tsaribrod (21,000 Bulgarians and no Serbs), Bosilegrad (22,000 Bulgarians and no Serbs), Strumitsa (25,000 inhabitants, mostly Bulgarians with a few Macedonians and Serbs), and a portion of the Timok valley. To Greece went Western Thrace, thus depriving Bulgaria of her outlet on the Aegean (See THRACE.) The capital, Sofia, in 1920 had 154,431 inhabitants. Other large towns, with their populations in 1920, are: Philippopolis (63,418), Varna (50,819), Ruschuk (41,574), Slivno (28,695), Plevna (27,779).

Agriculture and Industry. Agriculture as the chief occupation continued to engage two-thirds of the people, most of whom possessed their lands outright. In 1921, 9,290,175 acres were under cultivation. The accompanying table indicates the principal crops, and their yields (in short tons) for 1913 and 1922. (Figures are not exactly comparable because of changes in boundaries.)

Crops	1913		1922	
	Acreage	Yield	Acreage	Yield
Wheat	2,539,150	1,219,605	2,224,803	1,133,816
Rye	494,180	223,744	441,920	208,630
Barley	508,075	247,457	543,801	286,511
Oats	390,150	136,075	351,552	146,266
Corn	1,465,850	773,612	1,312,414	433,285
Tobacco ...	15,366	5,616	53,550	19,336

It is evident, therefore, that the country's leading activity was little deranged. While the export of surplus cereals fell off considerably as the two years are compared (370,110 metric tons in 1913 and 225,272 in 1922), the export of tobacco was more than six times that of 1913 (4543 metric tons in 1913 and 29,025 in 1922). Other articles to gain were silk cocoons and charcoal. The mining industry, too, showed great advances. Coal mined in 1923 totaled 1,063,662 metric tons as compared with an average pre-war yield of 125,000 tons. Copper, salt, and lead production were considerable.

Commerce and Transportation. Because of the fluctuating state of the exchange, the lev being worth 5 to the dollar in 1914, 7 to the dollar in 1915, 70 to the dollar in 1921, and 160 to the dollar in 1922 (though the June, 1923, quotation showed a rise to 80 0108), the commerce of the country, considered generally, was

sadly disorganized. Converted on a basis of average annual exchange, imports for 1913, 1920, 1922, were valued at \$36,535,000, \$39,849,000, \$27,795,000; exports for the same years were \$18,013,000, \$29,574,000, \$29,805,000. Thus 1922 saw the first favorable trade balance since the War. Principal countries of origin of imports (1922) were Germany, United Kingdom, Italy, Austria, United States. American imports reached an average of \$200,000 for 1910-14, \$1,900,000 for 1921, and \$600,000 for 1922. Principal countries of destination of exports in 1922 were Turkey, Germany, Italy, France, United States. Exports to the United States totaled an average of \$400,000 for 1910-14, \$400,000 for 1921, and \$1,300,000 for 1922. Size of shipping, an excellent index of the state of the country, showed that 4,951,452 tons entered Bulgarian ports in 1911; in 1920, only 1,111,515 tons. In 1913, total length of railways was 1388 miles, all state owned; in 1921, these had increased to 1582 miles. Several short lines were projected after the War but lack of funds held up the work of construction.

Finance. On Jan. 1, 1912, the public debt totaled 623,346,807 leva (with the lev equal to the franc). On May 31, 1922, the foreign debt stood at 530,985,000 francs, consolidated debt: 432,057,500 francs, unconsolidated; other, 24,967,000 francs. Reparations by the Treaty of Neuilly were fixed at 2,250,000,000 gold francs but early in 1923 were lowered to 550,000,000 gold francs, payable during 60 years. The internal debt, of course, was insignificant because of the depreciation of the currency. Revenues in 1909 were \$38,584,418; expenditures, \$36,830,884; of which latter, for debt service, \$415,120. For 1922, government finances were (converted at average exchange rate): revenues, \$20,912,000; expenditures, \$31,980,000; of which, for debt service, \$8,074,000. The paper currency steadily increased. In 1913, 188,742,000 leva were in circulation; at the end of 1923, 3,977,621,000. For this, there was in the country on Dec. 1, 1923, 39,000,000 leva in gold and 14,412,000 leva in silver. The cost of living rose twentyfold between 1913 and 1922, and continued to rise in 1923 and 1924.

Defense. By the Treaty of Neuilly, Bulgaria's war establishment was to be reduced to an army of 20,000 men, voluntarily enlisted for a 12-year term; a frontier guard of 3000, and a gendarmerie of 10,000. Enlistments were slow, however, so that by September, 1922, the regular army consisted only of 7000 men, the frontier guard of 430, and the gendarmerie of 3800.

History. Still smarting from the humiliations of the Treaty of Bucharest (1913), Tsar Ferdinand and the ruling clique—for the Bulgarian population was a peasantry and had little understanding of the purport of modern nationalism—regarded the War as an opportunity for the retrieving of their fortunes. The outcome in the beginning was uncertain, and while Ferdinand really meant to enter the struggle, he wavered for more than a year. During this period propaganda and counter-propaganda filled the country, as representatives of the Entente and the Central Powers exerted all their blandishments to gain Bulgarian aid. It was the Entente's inability to meet all of Bulgaria's demands, because of the unwillingness of Serbia and Greece to relinquish the portions of Macedonia claimed by

Bulgaria, that made the latter's coöperation with the Central Powers inevitable. An opposition for a brief moment lifted its head. Stambulisky, the leader of the Agrarian party, boldly declared for neutrality, but with his silencing (he was sentenced to life imprisonment), the way was clear, and on Oct. 12, 1915, war was declared on Serbia. Bulgaria's entry was a strategic victory, rather than a material one, for the Central Powers. While great aid might be expected in the Balkans, it was the fact that now the road lay clear to Constantinople and the East, that Gallipoli might be defended with munitions sent through an open land route, the connection between the Allies and Russians severed, and that the Allies must send troops to the southeastern front, i.e. Saloniki, that made Bulgaria's step such an important one. On her own side, Bulgaria's successes were phenomenal in the first two years. Serbia was immediately overrun, her armies pressed to the Adriatic, and a vain-glorious manifesto from the Bulgarian king declared that the traditional enemy no longer existed. War was declared on Rumania, Sept. 1, 1916, and armies occupied the Dobrudja. In November, Monastir fell, opening Macedonia to the invader. Germany had helped her Balkan ally with an annual allotment of money and technical units; Field-Marshal von Mackensen himself had directed the Bulgarian armies to their victories. Yet, though Bulgaria was united to Germany by every bond of gratitude, it was perceptible in 1917 that the Bulgarian war effort was weakening. The failing food supply, the discontent of the soldiers who had long been gone from their homes and their fields, and the necessity for lengthening the line of defense because of the Austro-Hungarian defeat in Albania in July, 1918, all served to render the Bulgarian position a precarious one. In September, 1918, the Serbian troops broke across the frontiers, and the Bulgarian high command, realizing defeat, asked for an armistice. On Oct. 4, 1918, King Ferdinand abdicated, and with him fled the ministry. Boris III succeeded to the throne. Stambulisky was released from prison and formed an Agrarian government, which was, on Nov. 27, 1919, invited to sign the Treaty of Neuilly. The terms were onerous. Territorial cessions were required in disregard of economic and ethnographic considerations. Certain small districts on the western frontier were turned over to Jugo-Slavia purely for strategic reasons. The renunciations of Thrace deprived Bulgaria of her Ægean littoral as well as important winter pasture lands in the valleys south of the mountains which were made the international boundary. Other terms were: the confirmation of the cession of the southern Dobrudja to Rumania; the reduction of the army; the surrender of all tanks, armored cars, poison gas, aeroplanes; a reparation charge of 2,250,000,000 gold francs; restitution of all live stock seized, an annual supply for 5 years of 50,000 tons of coal to Jugo-Slavia; the support of all Allied commissions. Concessions were made in a guarantee of freedom of transit to the Ægean and a promise of the protection of Bulgarian minorities in neighboring states. The problems of the new government were intensified by the 300,000 refugees who flocked into the country from Thrace, Macedonia, and the Dobrudja. The Agrarian government was confirmed in

power by the general elections of Mar. 28, 1920, which returned 110 Agrarians, 50 Communists, and 9 Socialists, as compared with 59 for the bourgeois parties. Under M. Stambulsky an internal policy was formulated wholly in the interest of the agricultural class. A reconstruction programme, stubbornly pushed in the face of the opposition of the bourgeoisie, included such diverse items as compulsory labor (1920), the expropriation of Crown and Church lands and all estates over 75 acres in the interests of the landless peasantry (1921), the prohibition of speculation and profiteering (1920), the extension of the education code (1920), government control of foreign trade through consortiums. Stambulsky's tone toward his Central European neighbors was friendly. A healthy agrarianism was the foundation of his country's well-being as, he saw, it was also of Czecho-Slovakia, Poland, Jugo-Slavia and Rumania. In January, 1921, he tried to gain the support of the first two for the creation of an international agrarian league, the so-called Green International, for their common protection against the bourgeois reactionaries and the communist radicals. The same purpose was expressed in the declarations of the congress of the Bulgarian Peasant Union, held in February, 1921. To lighten his country's burdens by gaining the good will of the Supreme Council and to show Western Europe that Bulgaria had parted with the old ways, Stambulsky during 1921-23 proceeded against those ministers who had involved the country in the War by contracting an alliance with Germany and breaking off relations with Serbia without the consent of the Sobranje. The last step taken was the sentencing to life imprisonment of six members of the Radoslav-off ministry, April, 1923. As a result of these activities, Lloyd George, at the Genoa conference (1922) gave Stambulsky his support, while in March, 1923, the Reparations Commission, equally convinced of Bulgaria's good intentions, reduced the Bulgarian indemnity to 550,000,000 gold francs.

There was no lack of opposition at home, of course. Bourgeois outbreaks occurred frequently during 1922 and, in September, street fighting in Sofia led to 15 deaths and the wounding of over 200. The elections of April, 1923, seemed to indicate that the country wholeheartedly supported the Agrarian cabinet, for 212 Agrarians, 16 Communists, and 15 Bourgeois were returned; but that any hope for continued domestic peace and sanity was illusory was shown when, in the morning of June 9, 1923, a *coup d'état* overthrew the government, forced the arrest of all the ministers save Stambulsky, who was absent from the capital, and set up a bourgeois bloc ministry headed by M. Tsankoff. Stambulsky himself was tracked down and killed five days later; the Sobranje was dissolved; and with the recognition of the revolutionary government, first by King Boris, and later (June 27) by the Little Entente, the revolution was complete. An indication of the temper of the new government was shown in the insistence with which it made demand upon the Lausanne Conference for an outlet to the Aegean by way of the Maritza valley and the port of Dedeagatch, and the refusal of the treaty commissioners to comply resulted in the familiar sabre-rattling, so characteristic of the old Bulgaria. Throughout the year affairs

were turbulent. The government attempted a diversion by attacks on the Communists, 95 of whom were brought to trial in July for counter-revolutionary agitation; while Agrarians and Communists retaliated by disorders and riots, even going so far as to seize and hold several towns in the northeast (September, 1923). The rising was short-lived though the government did not cease its repressive actions, and this in spite of the presumably popular victory which it obtained at the polls, November 18, when the bourgeois parties gained 185 seats against the opposition's 62. Where once there had been confidence, now was to be found suspicion: Bulgaria again became the storm-centre of Balkan intrigue and recriminations. Jugo-Slavia, Rumania, and Greece regarded askance Bulgaria's request for permission to employ conscription in the recruiting of the army; Bulgaria, Serbs charged, had become the stamping ground of Macedonian anti-Serb propaganda, from Greece came the demand that the recruiting of bands near the Thracian frontier cease. Throughout 1924 two discordant notes were still in evidence in internal affairs: the agitations of the Macedonian party which threatened repeatedly to embroil Bulgaria in a war with Jugo-Slavia, and the continued activities of the Communists and Agrarians, whose strength could not be broken in spite of the high-handed actions of the government. Early in 1924, the government broke up the Communist party and in May, 1924, suppressed all newspapers showing Communist tendencies. Yet in the provincial councils' elections, the Communists-Agrarians gained 150 seats as against 352 by the government party (May, 1924). See also SLAVONIC LITERATURE; WAR, DIPLOMACY OF THE.

BULKLEY, LUCIUS DUNCAN (1845-). An American physician (see VOL. IV). As a dermatologist and founder of the Skin and Cancer Hospital, Dr. Bulkley's natural interest in the subject of malignant tumors led him to devote his attention entirely to the possibility of their non-surgical treatment. He has published four new books on this subject since 1915, *Cancer: Its Cause and Treatment*, 2 vols. (1915-16); *The Medical Treatment of Cancer* (1919); *Cancer and Its Non-surgical Treatment* (1921), and *Cancer of the Breast* (1924). He also established a new quarterly periodical, *Cancer*, the first number of which was issued in October, 1923.

BULLARD, ARTHUR (1879-). An American author, born at St. Joseph, Mo., and educated at Blair Presbyterian Academy and Hamilton College (Clinton, N. Y.). As foreign correspondent he has been connected with *Harper's Weekly*, *Collier's Weekly*, *The Outlook*, *Atlantic Monthly*, etc. In 1917-19, he was a member of the committee on public information and subsequently director of its Russian and Siberian divisions. Among his works are *The Diplomacy of the Great War* (1915); *Mobilizing America* (1917); *The Russian Pendulum* (1919); *The Stranger* (1920), and *A B C's of Disarmament and Pacific Problems* (1920).

BULLARD, ROBERT LEE (1861-). An American army officer, born in Youngsboro, Ala. He graduated from the United States Military Academy in 1885 and was appointed second lieutenant in the same year. During the Spanish-American War he served as colonel of

the third Alabama Infantry. In 1889 he was commissioned colonel of volunteers in the army, and in 1902, following his discharge from the Volunteer Service, became a major in the Regular Army. He was promoted to be colonel in 1911 and major general in 1917. He commanded the second brigade of the first division in France in June, July, and August, 1917, and in the last month was appointed major general in the national army. He commanded the first division in all its engagements and operations against the Germans, from December, 1917, to July, 1918. He was promoted lieutenant-general in 1918 and major general of the Regular Army in November of the same year. From October, 1918, to April, 1919, he commanded the second army. He was awarded the Distinguished Service Medal and was decorated by France, Belgium, and Italy. He was appointed commander of the Department of the East in 1921. He was the author of numerous articles in magazines and military journals.

BULLOCK, SHAN P. (1865-). An English novelist (see VOL. IV). He is the author of *The Making of a Soldier* (1916) and *Mr. Ruby Jumps the Traces* (1917).

BÜLOW, BERNHARD HEINRICH KARL MARTIN, PRINCE VON (1849-). A German statesman (see VOL. IV). Having been very active previously in furthering the German policy which caused the War, he was given temporary charge of the German Embassy in Rome on Dec. 19, 1914, to try to smooth over the differences between Austria-Hungary and Italy. He was unsuccessful, and Italy declared war on May 23, 1915. He is the author of *Imperial Germany*, a book defending his own foreign policy. It was translated into English in 1914, and a revised edition, omitting many compromising passages, appeared in 1916.

BUMPUS, HERMAN CAREY (1862-). An American educator (see VOL. IV). He resigned as president of Tufts College in 1919 and in the same year held the chairmanship of the Massachusetts Security League.

BUMSTEAD, HENRY ANDREWS (1870-1920). An American physicist, born at Pekin, Ill., and educated at Johns Hopkins University, where he became instructor in physics until 1893, when he received a similar appointment in the Sheffield Scientific School of Yale. He left Yale in 1906 to become full professor at the Sloane Physical Laboratory. He also became director of the latter, a place which he held until his death. During the War he was a scientific attaché of the United States Embassy in London (1918-19). He was connected with the National Research Council (1920). His scientific researches included studies on radioactive gas in water and on atmospheric radioactivity, as well as on the effects produced by röntgen rays in different metals. He also published a series of papers on the emission of electrons by metals under the influence of alpha rays.

BUNDY, OMAR (1861-). An American army officer, born in Newcastle, Ind. He graduated from the United States Military Academy in 1883 and in the same year was commissioned second lieutenant. He rose through the various grades, becoming colonel of the 16th infantry in 1914 and adjutant general in 1915. His earlier service included campaigns against the Indians and the Spanish-American War. He served in the General Staff College from

1902 to 1905. In 1917 he was appointed brigadier general of the national army and major general in the same year. From October, 1917, to July, 1918, he commanded the second division of the American Expeditionary Forces in France; in 1918 he commanded the sixth and seventh army corps. At the close of the War he was appointed major general of the regular army and was given command of the Philippine department in 1922.

BUNIN, IVAN A. (1870-). A Russian poet and novelist. An opponent of the modernists, he followed the older classic tradition. And in exile in Paris since the Revolution, he has described with vivid realism ruined estates, the miserable life of the peasants (for whom, however, he had no love), and the *Intelligentsia*. He made his real début about 1905, with a volume of short stories and poems, becoming a stabilizing force in Russian literature, which had run wild under the influence of the decadents and the early revolution. His works include various collections of poems (1886-1915); *The Village*, sketches (1910); *The Temple of the Sun* (travel sketches); *The Gentleman from San Francisco*, short stories, (1917); *The Cry*, ten stories (1921); and translations of Byron, Tennyson, and Longfellow.

BUNZELL, HERBERT HORACE (1887-). An American chemist, born near Prague, Czechoslovakia. In 1903 he removed to the United States and in 1906 graduated from the University of Chicago. He did graduate work at that institution and in Berlin. After service at the University of Chicago, he was an expert with the United States Department of Agriculture in 1910-11 and chemical biologist in the same department, 1911-16. He served for several years on the faculty of Georgetown University and in 1917-18 was professor and head of the department at the University of Cincinnati. He was professor of chemistry at the Woman's Medical College of Pennsylvania in 1920 and also practiced as consulting chemist. He contributed numerous papers to chemical journals and was a member of several scientific societies.

BURBANK, LUTHER (1849-1926). An American naturalist (see VOL. IV). He continued his experiments at the Burbank Experiment Farms at Santa Rosa, Cal. Here he evolved many new varieties of fruits and flowers, including new apples, peaches, nuts, berries, and valuable trees. On these farms he has over 5000 distinctive botanical specimens from all parts of the world, and over 1,000,000 plants are raised every year for testing. He was special lecturer on evolution at Leland Stanford Junior University. He wrote *Training of the American Plant*; *Luther Burbank, His Methods and Discoveries*; and *How Plants Are Trained to Work for Man* (1921).

BURGENLAND. The problem which this region, sometimes known as German West Hungary, presented in the peace settlement, was unusual in involving the transfer of territory from one enemy country, Austria, to another, Hungary. The Burgenland, lying on the frontier between Austria and Hungary and including parts of the three Hungarian counties of Vas, Sopron, and Moson, has an area of 1684 square miles and a population of 330,000. Ethnical divisions were: Germans, 235,000; Croats and Wends, 50,000; Magyars, 25,000; Jews and others, 20,000. On the grounds of race, therefore, the validity of the Austrian

claims before the Peace Conference were obvious. Other considerations were favorable to the transfer, and it is likely that some of these bore more weight with the Supreme Council than the matter of ethnography. It was pointed out that the Burgenland was "the kitchen garden of Vienna" and that its separation from the city by an international boundary would entail distinct hardships. Again, the territory would serve as an excellent buffer region between the two states, an important desideratum in view of the establishment of the Bolshevik régime of Béla Kun in Hungary. It has also been suggested, not without reason, that the Allies purposed, by making Burgenland a cause of dissension between Austria and Hungary, to prevent the restoration of the former Habsburg Empire. Therefore, on July 20, 1919, the Peace Conference decided to cede the Burgenland to Austria without a plebiscite, though it is interesting to note that the Austrians themselves suggested a vote for the ascertainment of the wishes of the inhabitants. Throughout 1920 Hungary remained in control, and as negotiations regarding the cession yielded no definite results, tension increased. The advent of reaction in Hungary under Horthy complicated matters. A frenzied propaganda in favor of the retention of the disputed region filled the country, and cultural and sentimental reasons were adduced to feed the flame of the new Hungarian nationalism. It was maintained that the Burgenland was one of the richest regions of the former kingdom and that 30 per cent of its population had been engaged in various manufacturing establishments vital to the economic life of Hungary. There were located coal mines and stone quarries as well as the city of Sopron (Oedenburg), the centre of a great carrying trade of cattle and foodstuffs. From the Burgenland had come Haydn, Liszt, and Count Stephen Szechenyi, and its counties had always been regarded by the patriotic as the outposts of Magyar civilization on the West and the rampart of Hungary against Germanism. It was becoming plain that Hungarians would not relinquish the region without a struggle. In August, 1921, irregular troops, of the party of ex-premier Friedrich and the reactionary society known as "The Awakening Hungarians," poured into the country and forcibly ejected the Austrian officials who had appeared to take possession in accordance with the provisions of the Treaty of the Trianon. Austria, by this time, had become more than eager for the cession; Hungary, for her part, stubbornly maintained her rights to the eastern portion and refused to move against the armed bands. In September, Czechoslovakia, for the Little Entente, appealed to the Allies in behalf of Austria. On September 25 the Council of Ambassadors demanded the withdrawal of Hungarian troops, meanwhile, at the behest of Italy, refusing to permit Czechoslovakia and Jugo-Slavia to interfere. Largely as a result of Italian intervention a truce was patched up, October 13, by which Hungary promised to clear the counties of the predatory bands and hand over the Burgenland to Austria, while Austria consented to the holding of a plebiscite in the town of Sopron and its environs. Such a plebiscite was held in December at Sopron and proved favorable for Hungary. On December 30, therefore, Sopron and those districts contiguous to the Hungarian

frontier were turned over to the Hungarian police by an Allied military commission.

The encounter had aroused great interest in Europe because of the anomalous position of Austria throughout. At first accepting the decision of the Supreme Council with a real reluctance, her government had complied with the spirit of the treaties in every particular, only to see itself thwarted by a lawless aggression on the part of Hungarians, encouraged by French intrigue; and then, for fear of estranging a powerful neighbor, she had yielded to the Italian plan for a plebiscite. The impotence of Austria under these conditions chagrined her citizens and troubled the liberal elements of Europe and America. The settlement revealed to them the basic injustice of the peace treaties and their aftermath.

BURGESS, (FRANK) GELETT (1866-). An American author and illustrator (see VOL. IV). He is the author of *Burgess Unabridged* (1914), *The Goop Encyclopædia* (1915), *The Romance of the Commonplace*, enlarged edition (1916), *War the Creator* (1916), and *Mrs. Hope's Husband* (1917). He edited *My Maiden Effort* (1921) and *Have You an Educated Heart?* (1923).

BURGESS, GEORGE KIMBALL (1874-). An American physicist, born at Newton, Mass. He was graduated in 1896 from the Massachusetts Institute of Technology, where for two years he served as assistant in physics. Receiving a fellowship, he studied in Paris. On returning to the United States he taught in the Universities of Michigan and California. In 1903 he went to Washington as physicist in the Bureau of Standards, where after successive promotions he became in 1923 director of the Bureau in succession to Dr. S. W. Stratton. Dr. Burgess also served the United States as a member of various foreign service and engineering commissions of the National Research Council, especially during the War, and he was likewise a member of the National Aircraft Standards Board. The results of his many investigations have been published in a series of papers on the constant of gravitation, on high temperature measurements, and on the properties of metals and alloys; many of these were issued in the series of technical papers of the Bureau of Standards.

BURGESS, JOHN WILLIAM (1844-). An American university dean (see VOL. IV). In 1914-15 he was visiting American professor in Austrian universities. He is the author of *Causes of the European Conflict* (1914), *The European War of 1914* (1915; popular edition, 1916), *The Reconciliation of Government with Liberty* (1915), *The Administration of President Rutherford B. Hayes* (1915), *America's Relations to the Great War* (1916), *Militarism and the Emperor* (1916), *The Russian Revolution and the Soviet Constitution* (1919), *The Transformation of the Constitutional Law of the United States Between 1898 and 1920* (1921), and *Recent Changes in American Constitutional Theory* (1923).

BURKE, BILLIE (MRS. FLORENZ ZIEGFELD, JR.) (1886-). An American actress, born in Washington, D. C. She made her début in London in support of Edna May in *The School Girl* at the Pavilion Music Hall. She appeared as leading woman in *Mr. George* (1907). In the same year she came to America and was very successful in her characterization of Bea-

trice Dupré as John Drew's leading woman in *My Wife*. Her later successes in New York were in *Jerry*, *The Rescuing Angel*, *Cæsar's Wife* and *The Intimate Strangers* (1921). She has also devoted much time to the movies.

BURKITT, FRANCIS CRAWFORD (1863-). An English professor (see VOL IV). Among his later works are *Jewish and Christian Apocalypses* (Sweich Lectures) (1914), *Some Thoughts on the Athanasian Creed* (1916), *Eucharist and Sacrifice* (1921), and *Earliest Sources of the Life of Jesus* (rev ed., 1922).

BURLEIGH, HENRY THACKER (1866-). An American song writer, born at Erie, Pa. In 1892 he entered the National Conservatory in New York City, studying there with Rukin Goldmark, J. White, and M. Spicker. In 1894 he became baritone soloist at St. George's, and in 1899 baritone soloist at the Temple Emanu-El. As a song writer he justly gained wide popularity. In 1917 he was awarded the Spingarn Medal for the highest achievement during 1916 by an American citizen of African descent. In 1920 Harvard University conferred on him the degree of Doctor of Music.

BURLESON, ALBERT SIDNEY (1863-). An American Postmaster-General (see VOL. IV). In 1918 he became chairman of the United States telephone and telegraph administration. He retired from the office of Postmaster-General in 1921.

BURLESON, HUGH LATIMER (1865-). An American bishop, born at Northfield, Minn., and educated at Racine College, Wis., and at the General Theological Seminary in New York City. From 1893 to 1900 he was curate, assistant, or rector of Protestant Episcopal churches in New York and Wisconsin. During the seven years following, he was dean of the Cathedral of the District of North Dakota, and in 1909-16, secretary of the Board of Missions of the Protestant Episcopal Church of the United States. In the latter year he became bishop of South Dakota. He wrote *The Conquest of the Continent* (1911) and *Our Church and Our Country* (1918).

BURLIN, NATALIE CURTIS (?-1921). An American writer born in New York City. She studied music in France and Germany and devoted herself particularly to the collection of folk-songs of Indian tribes, traveling widely among them for that purpose. She made similar studies among the Zulu and other tribes of South Africa and among American Negroes. In 1917 she married the artist, Paul Burlin. Among her writings, which include probably the most successful works in the field of aboriginal American life, are *Songs of Ancient America* and *The Indian's Book*. The latter was again published in 1923 under the title, *The Indian Book*, with a few additions.

BURNET, JOHN (1863-). An English professor and dean (see VOL. IV). In 1919, he became Associate of the Royal Academy of Belgium and in the same year was also made Honorary Fellow of the Educational Institute of Scotland. He is author of *Greek Philosophy - Thales and Plato* (1914), *The Socratic Doctrine of the Soul* (1916), and *Higher Education and the War* (1917).

BURNETT, FRANCES (ELIZA) HODGSON (1849-1924). An American author (see VOL. IV). After 1914 she added to her already long list of works *One I Knew the Best of All* (1915), *Little Hunchback Zia* (1916), *White People*

(1917), *Good Wolf* (1919), *The Head of the House of Coombe* (1922), *The Fair Barbarian* (1923), *Robin* (sequel to *The Head of the House of Coombe*, 1922), and others. She edited *The Children's Book* (1914).

BURNHAM, CLARA LOUISE (1861-1927). An American author, born at Newton, Mass. She wrote many stories and poems for the magazines and the text for many of her father's cantatas. Among her novels were *Dr. Latimer* (1893); *The Right Princess* (1902); *Jewel* (1903); *Jewel's Story Book* (1904); *The Opened Shutters* (1906); *The Leaven of Love* (1908); *The Inner Flame* (1912); *The Right Track* (1914); *Instead of the Thorn* (1916); *Hearts' Haven* (1918); *In Apple-blossom Time* (1919), and *The Keynote* (1921). She was a Christian Scientist and most of her books are permeated with the principles of that faith. She was notably successful in depicting New England characters.

BURNS, JAMES ALOYSIUS (1867-). An American clergyman and college president, born at Michigan City, Ind., and educated at the University of Notre Dame. After two years spent as a lay teacher he was ordained to the Roman Catholic priesthood in 1893 and from that time until 1900 was professor of sciences in the University of Notre Dame. He was then made president and professor of moral theology in Holy Cross College (Washington). In 1919 he returned to the University of Notre Dame as president. His publications include *Principles, Origin and Establishment of the Catholic School System* (1908); *The Growth and Development of the Catholic School System* (1912), and *Catholic Education: A Study of Conditions* (1917).

BURNS, RT. HON. JOHN (1858-). An English parliamentarian (see VOL. IV). In 1914 he resigned from the presidency of the Local Government Board, and became president of the Board of Trade. He resigned from the latter office when war was declared. Until 1918 he was a radical member of Parliament.

BURNS, KEVIN (1881-). An American spectroscopist, born at Pleasant Ridge, N. B. He was graduated at the University of Minnesota in 1903. He was connected with the Lick Observatory during 1904-07 and again as a Martin Kellogg fellow during 1910-12. In 1913 he was a physicist at the Bureau of Standards (Washington), but in 1920 he became the astronomer at the Allegheny Observatory. His specialty is the application of the spectroscope to heavenly bodies, the orbit of lambda Andromedæ, the ring nebula in Lyra, and the Orion region, on which he has published his findings.

BURNSIDE, RICHARD H. ("ZIPP") (?-). A dramatic author and stage director best known for *Chin-Chin*, written with Anne Caldwell (1914), *Hip-Hip Hooray!* (1915), *The Big Show* (1916), *Cheer Up* (1917), *Happy Days* (1919), *Miss Millions* (1919), *Tip-Top*, with Anne Caldwell (1920) and others. He was general producer for the New York Hippodrome.

BURR, GEORGE LINCOLN (1857-). An American professor (see VOL IV). In 1919 he became John Stambaugh professor of history in Cornell University. He edited *Narratives of Witchcraft Cases* (1913).

BURR, WILLIAM WESLEY (1880-). An American agriculturalist, born at Goodland, Ind. He graduated from the University of Nebraska in 1906 and until 1913 was associate professor

of crops and soils there. From 1903 to 1913 he was also in charge of the cooperative work in the office of dry land agriculture in the North Platte Experiment Station, Bureau of Plant Industry, United States Department of Agriculture. From 1913 to 1916 he was assistant agriculturalist and from the latter date professor of agronomy and head of the department at the University of Nebraska. He was also vice-director of the experiment station of that university. He was a member of several scientific societies and wrote on soil moisture, crop production, dry land agriculture, etc.

BURRAGE, CHAMPLIN (1874-). An American scholar born at Portland, Me., and educated at Brown University and at Berlin, Marburg, and Oxford. From 1912 to 1915 he was librarian of Manchester College, Oxford, and from 1915 to 1917, librarian and member of the faculty of Brown University. His publications include *A New Year's Gift by Robert Browne, 1588* (1904); *The Church Covenant Idea* (1904); *The True Story of Robert Browne* (1906); *New Facts Concerning John Robinson* (1910); *The Early English Dissenters in the Light of Recent Research* (1912); *John Penry, the So-Called Martyr of Congregationalism* (1913); *Nazareth and the Beginnings of Christianity* (1914); *John Pory's Lost Description of Plymouth Colony* (1918); *An Answer to John Robinson of Leyden* (1920); *The Minoan Hieroglyphic Inscriptions, I: The Phæstos Whorl* (1921), and *Prehistoric Aegean Inscriptions from Minoan Crete, the Aegean Islands, Cyprus, Greece and Troy, Part I* (1922).

BURRELL, DAVID JAMES (1844-1926). An American clergyman (see VOL. IV). He is the author of *We Would See Jesus* (1914), *The Apostles' Creed* (1915), *Why I Believe the Bible* (1917), *The Laughter of God* (1918), *Campaigns of Paul* (1919), *The Resurrection and the Life Beyond* (1920), *Paul's Companions* (1921), and *Paul's Letters* (1921).

BURRELL, MARTIN (1858-). A Canadian statesman (see VOL. IV). From 1917 to 1919 he was Secretary of State of Canada and Minister of Mines, having previously been Minister of Agriculture. In 1920 he became Parliamentary Librarian of Canada.

BURRITT, MAURICE CHASE (1883-). An American agriculturist, born at Hilton, N. Y., educated at Cornell. From 1902 he was engaged in farming at Hilton, N. Y. He was scientific assistant for the United States Department of Agriculture from 1908 to 1911 and was county agent leader for the New York State College of Agriculture at Cornell University, 1914-17. In 1917 he became vice-director of extension work at that institution. He took a prominent part in organizing a farm bureau and agricultural extension system in New York State. He wrote *Apple Growing* (1915), and *The County Agent and the Farm Bureau* (1922).

BURROUGHS, JOHN (1837-1921). An American essayist and naturalist, born at Roxbury, N. Y. His writings in his later years took on a wider aspect than his earlier books and were devoted largely to a general study of life and its meaning. In 1913 he published *The Summit of the Years*; in 1915, *The Breath of Life*; in 1916, *Under the Apple Trees*; in 1919, *Field and Study*; and in 1920, *Accepting the Universe*. John Burroughs died on March 29, 1921, and was buried at Roxbury, in a hillside pasture near his Catskill retreat at "Woodchuck Lodge," which he had ac-

quired in addition to his rustic cottage at "Slab-sides" at West Park, not far from the Hudson River, where much of his writing was done.

BURROWS, MONTROSE THOMAS (1884-). An American pathologist, born at Halstead, Kan., and educated at Kansas and Johns Hopkins. For a year he held a fellowship at the Rockefeller Institute, where also during 1909-10 he was assistant pathologist. In 1910 he became instructor in anatomy at the Cornell Medical College, and in 1915 he accepted the appointment of pathologist to the Hopkins Hospital. Five years later he was called to the chair of pathology in the Washington University Medical School in St. Louis, and in 1920, he became director of the research laboratory at the Barnard Face, Skin and Cancer Hospital (St. Louis). His original investigations have included studies of tissue cultivation, mechanism of growth and division of cells and heart muscle contraction, inter-cranial processes, and various problems in epidermiology.

BURSTING CHARGES. See EXPLOSIVES.

BURTON, ERNEST DEWITT (1856-1925). An American theologian (see VOL. IV). He is the author of *Harmony of the Synoptic Gospels in Greek*, with Edgar J. Goodspeed (1920); *Commentary on Paul's Epistle to the Galatians* (1920); *Jesus of Nazareth, How He Thought, Lived, Worked, and Achieved* (1920); and *Source Book for the Study of the Teaching of Jesus in Its Historical Relationships* (1923).

BURTON, MARION LE ROY (1874-1925). An American University president (see VOL. IV). In 1917 he resigned as president of Smith College (Northampton, Mass.), to accept the presidency of the University of Minnesota. He stayed in the latter institution until 1920, when he became president of the University of Michigan. His works include *Life Which Is Life Indeed* (1914), *First Things* (1915), and *On Being Divine* (1916).

BURTON, RICHARD EUGENE (1861-). An American college professor (see VOL. IV). His works include *How to See a Play* (1914), *Bernard Shaw—the Man and the Mask* (1916), *Poems of Earth's Meaning* (1917), and *Charles Dickens—How to Know Him* (1919). He was president of the Drama League of America, (1914-15).

BURTON, THEODORE ELIJAH (1851-). An American Congressman (see VOL. IV). He was a member of the Sixty-seventh Congress (1921-23) for the Twenty-second District of Ohio. In 1921 he was a member of the executive committee of the Interparliamentary Union. He had the unanimous support of the Ohio delegation for presidential nominee in the Republican national convention in 1916. From 1917 to 1919 he was president of the Merchants' National Bank of New York City, and in the latter year he was also Stafford Little Lecturer at Princeton University. His works include *Some Political Tendencies of the Times and the Effect of the War Thereon* (1919).

BURTON, WILLIAM MERRIAM (1865-). An American chemist, born at Cleveland, Ohio, and educated at Western Reserve and Johns Hopkins Universities. In 1889 he entered the service of the Standard Oil Company of Indiana as chemist and after serving as superintendent and vice-president became its president in 1918. His important investigations have had to do with the technology of petroleum, notably a "cracking" process which has doubled the out-

put of gasoline. The Willard Gibbs medal of the American Chemical Society was conferred on him in 1918, and in 1922 he received the Perkins medal of the Society of Chemical Industry.

BURY, SIR GEORGE (1866-). A Canadian railway official. He was educated at Montreal College and in 1883 entered the employ of the Canadian Pacific Railroad. In 1907 he was made general manager of its western lines and from 1911 was president of the road. In 1917 he visited Russia in order to assist in the reorganization of shipping in that country. In the same year he was knighted.

BUSCH, CARL (1862-). An American composer and conductor, born at Bjerre, Denmark. After completion of his studies at the Conservatory in Copenhagen he spent a year in Paris as viola player in Godard's orchestra. In 1887 he settled in Kansas City, where in 1912 he founded the Kansas City Symphony Orchestra, which he conducted. He frequently appeared with other orchestras in the United States, Germany, and Denmark, as conductor of his own works. His works include a symphonic prologue, *The Passing of King Arthur*; a symphonic poem, *Minnehaha's Vision*; *Ode to France* and *Negro Carnival* for orchestra; *A Chant from the Great Plains* for military band; *Sir Galahad* for baritone, chorus and orchestra; and nine cantatas.

BUSCH, JOSEPH FRANCIS (1866-). An American bishop, born at Red Wing, Minn., and educated at Innsbruck, Austria, and at the Catholic University (Washington, D. C.). Ordained to the Roman Catholic priesthood in 1889, he became secretary to Archbishop Ireland and assistant pastor in St. Paul, Minn. He was then pastor in South St. Paul, Minneapolis and LeSueur, Minn. In 1910 he was made bishop of Lead, S. D., and in 1915 bishop of St. Cloud, Minn.

BUSH, BENJAMIN FRANKLIN (1860-). An American railway official, born in Wellsboro, Pa., and educated at the State Normal School at Mansfield, Pa. He began his railway service on the Northern Pacific Railroad in 1882. In 1887 he was appointed division engineer of the Union Pacific Railroad in Idaho and Oregon. He served as general manager and superintendent of several railroads in the west and in 1907 was appointed president of the Western Maryland Railroad. He was president also of the Denver and Rio Grande Railroad in 1912 and 1915 and of the Western Pacific Railroad in 1913. He went back as president to the Western Maryland in 1917. In addition to his service as railway official he held several important government offices and was a member of the advisory board on fuels and structural material in 1907. During the War he acted as regional director in the southwestern district for the Federal railroad administration.

BUTLER, HENRY MONTAGU (1833-1918). An English educator (see VOL. IV). He published a volume of classical verse, *Leisure Hours of a Long Life* (1914). He died at Cambridge on Jan. 14, 1918.

BUTLER, HOWARD RUSSELL (?-). An American artist who won the Carnegie prize from the National Academy of Design (1916) and the prize from the Duxbury Exhibition in 1917. He accompanied the United States Naval Observation Expedition to Baker, Oregon, and painted the solar eclipse of June 1918. Thus

last painting is owned by the American Museum of Natural History.

BUTLER, NICHOLAS MURRAY (1862-). An American educator, president of Columbia University (see VOL. IV). He continued to take an active part in educational and political affairs in the decade 1914-24. From 1914 he was president of the France-America Society, and from 1919 was corresponding member of the Academy of Arts and Letters of Naples. In 1917 he was president of the American Hellenic Society. He was mentioned as a possible candidate for the presidency in 1920 and received several votes in the National Convention. In May, 1924, he created a nation-wide sensation by a speech delivered at a dinner of the Missouri Society, in which he denounced the Prohibition Constitutional Amendment, and declared that it should be repealed. For this attitude he was both praised and denounced by newspapers, organizations and individuals throughout the country. His later publications include *The Meaning of Education* (1915); *The World in Ferment* (1917); *Is America Worth Saving? and Other Addresses* (1920); *Scholarship and Service*, (1921).

BUTTENWEISER, MOSES (1862-). An American scholar, born at Beerfelden in Germany and educated at the universities of Würzburg, Leipzig, and Heidelberg. In 1897 he became professor of Biblical exegesis in the Hebrew Union College of Cincinnati, Ohio. His works include *The Hebrew Elias-Apocalypse*, in German (1897); *An Outline of Neo-Hebraic Apocalyptic Literature* (1901), *The Prophets of Israel* (1914); *The Book of Job* (1920), and numerous articles in learned publications.

BUTTER. See DAIRYING.

BUXTON, NOEL (1869-). An English social reformer and labor leader. He was educated at Cambridge and acted as aide-de-camp to his father when the latter was Governor of South Australia. He founded a farmers' co-operative society, was an active member of many organizations engaged in social reform work and also of the Christian Social Union. In January, 1924, he was appointed minister for agriculture in the Labor cabinet of Ramsay MacDonald. He published *Europe and the Turks* and *With the Bulgarian Staff*, and was part author of *The Heart of the Empire, Travel and Politics in Armenia, The War and the Balkans*, and *Balkan Problems and European Peace*.

BUXTON, SYDNEY CHARLES BUXTON, first Viscount (1853-). An English statesman (see VOL. IV.) He became High Commissioner and Governor General of South Africa in 1914 and was at the same time created Viscount Buxton. In 1920 he retired from office.

BYELY, ANDREY (B. N. BUGAYEV) (1880-). A Russian poet, novelist, and critic. He early showed talent in a variety of directions; he was gifted in mathematics, philosophy, and music, but turned all his gifts to the cause of the literary symbolists. Just as he passed through many stages in the development of his philosophy as a theosophist, so his writings include all genres and styles. He began his career in 1904 by a series of philosophical and critical essays in *The Scales* and also by his first volume of collected poetry, entitled *Gold in Blue*. He came to be regarded as the most individual of the Russian modernists.

His works include *Symphonies* (symbolic poems in prose; *The Heroic* (Northern Symphony), 1902; *The Second* (Dramatic Symphony), 1904; *The Return* (Third Symphony), 1905; *The Goblet of Snow-Storms* (Fourth Symphony), 1908; *The Silver Dove*, a novel, 1910; *Petersburg*, a novel, 1912; *Poems*, 1904-17; and *Symbolism* (essays on artistic creation), 1910. The two novels form parts of a trilogy, of which the third part, *Kotik Letajew*, appeared during the Revolution.

BYNG, JULIAN HEDWORTH GEORGE BYNG, first BARON OF (1862-). A British general. He saw service in India and South Africa, and in 1909 was made major general. When the British occupied Egypt in 1912 he was placed in charge of the army of occupation. During the War he was a Corps commander, first in the Dardanelles campaign (1915-16) and then on the western front where he was chosen to head the newly formed Canadian army corps (1916). In this position he was responsible for the celebrated storming of Vimy Ridge (Apr. 9, 1917). In June, 1917, he was raised to the post of army commander, executed the attack on the Cambrai front in November, and was promoted to the rank of full general. His other honors included a peerage in 1919, a grant of £30,000, and decorations from all the Allies. In 1921 he was appointed Governor General of Canada.

BYNNER, WITTER (1881-). An American playwright, born in Brooklyn and educated at Harvard. He is associate editor of *Palms*. His best known work includes *The New World* (1915); *Iphigenia in Tauris* (1915); *Any Girl* (1917); *Grenstone Poems* (1917); *A Canticle of Praise* (1919); *The Beloved Stranger* (1919); *A Canticle of Pan* (1920); *Pins for Wings* (1920, under pseudonym of Emanuel Morgan); *A Book of Plays*, from the French of Vildrac (1922), and *A Book of Love* (1923). He is co-author with Arthur Davison Ficke of *Spectra* (1916); with Julia Ford, *Snickerty Nick* (1919); with Dr. Kiang Kang-hu, *The Jade*

Mountain, translated from the T'ang poets (1924).

BY-PRODUCT COKE. See COKE.

BY-PRODUCTS. RECOVERY OF. See CHEMISTRY, ORGANIC.

BYRAM, HARRY E. (1865-). An American railway official, born in Galesburg, Ill., and educated in the common schools. He began his railway service with the Chicago, Burlington and Quincy Railroad at the age of 16. He served in several capacities in this company until 1894, when he began service with the Great Northern Railroad as chief clerk in the vice-president's office. In the years following he filled important positions with several railroads in the Middle and Far West and was appointed general superintendent for Nebraska of the Chicago, Burlington and Quincy in 1904. In 1917 he was appointed president of the Chicago, Milwaukee and St. Paul Railroad.

BYRNE, CHRISTOPHER EDWARD (1867-). An American bishop, born at Byrnesville, Mo., and educated at St. Mary's College (Kan.) and St. Mary's Seminary (Baltimore, Md.). From 1891 to 1918 he was pastor of churches in Columbia, Edina, and Saint Louis, Mo. In 1918 he was made bishop of Galveston, Tex.

BYRNE, DONN (BRIAN OSWALD DONN BYRNE) (1889-). An American author, born in New York City, and educated at the University College, Dublin, and in Paris and Leipzig. On his return to New York he was connected with the *New York Sun* and the *Brooklyn Daily Eagle*. Even though Donn Byrne said of his own writing, "its faults are because I cannot write better yet," and though that was perhaps true, he has, in his contributions to magazines and in his books, caught a beauty which is haunting and elusive. *Stories Without Women*, published in 1915, was followed by *The Stranger's Banquet* (1919); *The Foolish Matron* (1920); *The Woman God Changed* (1921); *Messer Marco Polo* (1921); *The Wind Bloweth* (1922), and *The Changeling* (1923), a collection of short stories.

CABELL, JAMES BRANCH (1879-). An American author, born at Richmond, Va., and educated at William and Mary College. For a year he was instructor in French and Greek in William and Mary College, and thereafter, until 1901, was occupied as a journalist in Richmond and New York. His works include *The Soul of Melicent* (afterwards published under the title *Domnei*) (1913); *The Rivet in Grandfather's Neck* (1915); *The Certain Hour* (1916); *The Cream of the Jest* (1917); *Jurgen* (1919); *The Judging of Jurgen* (1920); *Figures of Earth* (1921); *Joseph Hergesheimer* (1921); *The Jewel Merchants* (1921); *The Lineage of Litchfield* (1922), and others.

CABLE STEERING. See NAVIGATION.

CABOT, RICHARD CLARKE (1868-). An American physician, born at Brookline, Mass., and educated at Harvard University (A.B. 1889; M.D. 1892). He became full professor of medicine at Harvard in 1919 and was Chief of the Medical Staff of the Massachusetts General Hospital from 1912 to 1921. During the War he saw service abroad and became Lieutenant-Colonel of the Medical Reserve Corps. Among his publications are: *A Guide to the Clinical Examination of the Blood* (1898); *Physical Diagnosis of Diseases of the Chest* (1900); *Case Teaching in Medicine* (1906); *Differential Diagnosis* (1911); *What Men Live By* (1914); *A Layman's Handbook of Medicine* (1916); *Social Work* (1919). Several of his practical works have gone through numerous editions and his *Differential Diagnosis* was translated into German. The author originated a new feature in medical teaching in these volumes, the subject matter consisting wholly of case histories presented in novel fashion.

CADMAN, CHARLES WAKEFIELD (1881-). An American composer, born at Johnstown, Pa., Dec. 24, 1881. He received his entire musical education from private teachers in Pittsburgh, where he lived until 1909 as organist of various churches, conductor of a male chorus and critic of the *Pittsburgh Dispatch*. Having become interested in the music of the American Indians, he spent some time at the reservation of the Omaha Indians, making phonographic records of their songs and pieces for flute. Together with Princess Tsianina Redfeather, a full-blooded Indian mezzo-soprano, he lectured on Indian lore, making extensive tours of the United States and also visiting Paris and London. Of his operas, *Shanewis* or *The Robin Woman* was produced at the Metropolitan Opera House (Mar. 23, 1918). *The Garden of Mystery* (one act) and *The Red Rivals* or *Daoma* (three acts) have not yet been produced. His other works consist of a piano-trio in D, a piano-sonata in A, a Japanese song-cycle, and several Indian song-cycles.

CADMAN, (SAMUEL) PARKES (1864-). An American clergyman, born at Wellington, England, and educated at the University of Lon-

don. From 1896 to 1901 he was pastor of the Metropolitan Temple, New York City, and after that time pastor of the Central Congregational Church of Brooklyn, N. Y. He was a popular lecturer, active in Y. M. C. A. work, his Sunday afternoon talks being broadcast by radio. His works include: *Charles Darwin and Other English Thinkers* (1911); *The Victory of Christmas*; *The Religious Uses of Memory* (1912); *The Life of William Owen* (1912); *The Three Religious Leaders of Oxford* (1916); and *Ambassadors of God* (1920).

CADORNA, COUNT LUIGI (1850-). An Italian general, born at Pallanza of a distinguished Italian family. He entered the army in 1886, was promoted steadily, and in 1914 became chief of the general staff. After the defeat at Caporetto he was transferred to the Military Council at Versailles, and later, as a result of the findings of the Caporetto inquiry commission, was retired from the army.

CAILLAUX, JOSEPH (1863-). A French public official (see Vol. IV). Six days after the release of Mme. Caillaux, who had been tried for the shooting of M. Gaston Calmette, and acquitted, the War began. In 1916, Caillaux went to Rome, and because of remarks made by him to Italian statesmen that France could not continue the War after the spring of 1917 and that first peace and then an alliance with Germany should be concluded, Briand gave permission to the Italian government to arrest Caillaux and confiscate his papers. The taking of these papers proved most embarrassing to Caillaux, one being the elaboration of a project to overthrow the legal government and have himself made dictator, and the other containing the names of politicians, newspaper managers, etc., whom it would be necessary to arrest or exile. He claimed they were merely dreams, but he was condemned to three years in prison and to 10 years' suspension of his civil rights. He was not allowed to live in Paris or in several other large cities. He was released several days after the verdict, however, but up to July, 1924 was an exile in the provinces. In that month he was granted amnesty and allowed to return to France.

CALCIUM. See CHEMISTRY.

CALDER, JAMES ALEXANDER (1868-). Canadian public official (see Vol. IV). After 1914 he was Minister of Railways and Highways, first vice-president of the Canadian Chamber of Commerce of London, and a member of the Imperial War Conference (1918).

CALDWELL, ANNE (?-). A dramatic author and composer whose best known works include besides collaborations with Richard Burnside (q.v.): *Pom-Pom* (1916); *Go to It* (with John Golden and J. E. Hazzard, 1916); *A New Girl* (1919); *The Lady in Red* (1919); *She's a Good Fellow* (1919); *The Night Boat* (1919); *The Sweetheart Shop* (1920).

CALDWELL, BURNS DUBBIN (1858-). An American railway official, born in Placerville,

Cal. He was educated in the public schools of Chambersburg, Pa., and began his railway service in 1875 with the Vandalia Line. From 1886 to 1892, he was employed in important capacities with several western railroads and from 1889 to 1902 was traffic manager of the D L & W. Railroad. From 1902 to 1911, he served as vice-president of that road and from 1911 was president of Wells Fargo & Company. From 1918, he was chairman of the board of the American Railway Express Company.

CALENDAR. See **ASTRONOMY**

CALIFORNIA. The second State in size (158,297 square miles), and the eighth in population; capital Sacramento. The population of the State increased during the decade 1910-20, from 2,377,549 in 1910 to 3,426,861 in 1920, a gain of 44.1 per cent. The white population increased from 2,259,672 to 3,264,711; the Negro, from 21,645 to 38,763, the Indian, from 16,371 to 17,360; in 1920. While the Chinese showed a decrease from 36,248 in 1910 to 28,812 in 1920, the Japanese increased from 41,356 to 71,952. The native white population increased from 1,742,422 in 1910 to 2,583,049 in 1920, while the foreign-born whites increased from 517,250 to 681,662. The urban population in 1910 was 1,469,739; in 1920, 2,331,729; while the rural population showed an increase of from 907,810 to 1,095,132. The populations of the chief cities increased as follows. San Francisco (q.v.) from 416,912 in 1910 to 506,676 in 1920; Oakland (q.v.), from 150,174 to 216,261; San Diego from 39,578 to 74,683. During the decade, Los Angeles (q.v.) passed San Francisco as the largest city in the State, with a population of 319,198 in 1910 and 576,673 in 1920.

Agriculture. While the population in the State was increasing 44.1 per cent in the decade, 1910-20, the number of farms was increasing by 33.4 per cent (from 88,197 in 1910 to 117,670 in 1920), owing partly to the cutting up of large tracts. In 1910, the acreage was 27,931,444; in 1920 it was 29,365,667, an increase of 5.1 per cent; and the improved land in farms increased from 11,389,894 acres in 1910 to 11,878,339 in 1920. The total value of farm property in the State apparently increased from \$1,614,694,584 to \$3,431,021,861, or 112.5 per cent; the average value of farm property, from \$18,308 to \$29,158, an increase of 59.30 per cent. In interpreting these values, however, and, indeed, all comparative values in the decade 1914-24, the inflation of the currency in the latter part of that period is to be taken into account. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. The total percentage of the land area in farms increased from 28 per cent in 1910 to 29.5 per cent in 1920; but the percentage of improved farm land decreased slightly, from 40.8 to 40.4 per cent. Of the total of 117,670 farms in 1920, the number operated by owners was 81,580 as compared with 66,632 in 1910; by managers 4949, as compared with 3417; and by tenants, 25,141, as compared with 18,148. There was an increase in the decade of about 20,000 owners and 7000 tenants. The white farmers in 1920 numbered 111,184, as compared with 85,119 in 1910; and the number of Japanese farmers had increased from 1816 to 5152 during that time. The total number of colored farmers, including Negroes, Indians, Japanese and Chinese, was 6486 in 1920 as compared with 3078 in 1910. The farms free

from mortgage numbered 36,042 in 1920, as compared with 39,368 in 1910; while the number of mortgaged farms increased from 26,749 in 1910 to 44,109 in 1920. Of the 117,670 farms in the State in 1920, 67,391 were irrigated, or a total irrigated area of 4,219,040 acres. In 1920, 57.3 per cent of all farms were irrigated, as compared with 44.6 per cent in 1910.

The number of cattle in 1920 and 1910 was 2,008,037 and 1,809,226, respectively. The number of sheep increased from 1,525,288 to 2,400,151. Poultry-raising developed appreciably in the decade, the number of fowls being nearly 11,000,000 in 1920. The production of small fruits in 1919 was 15,458,726 quarts, compared with 26,824,120 quarts in 1909; oranges, 21,628,444 boxes compared with 14,436,180 in 1909; lemons, 6,551,657 boxes compared with 2,756,221 boxes; and grapefruit, 465,085 boxes compared with 122,515. The coming of prohibition, which it was anticipated would paralyze the wine-grape industry and depreciate the value of lands used for the purpose, had quite the opposite effect. The vine-growing area more than doubled, although not all yet in bearing, and prices for the crop far in excess of those that previously prevailed were secured. The estimated production of the chief crops in 1923 was as follows: corn, 4,557,000 bushels; wheat, 16,157,000 bushels; oats, 5,475,000 bushels; barley, 34,346,000 bushels; rice, 5,470,000 bushels; potatoes, 8,121,000 bushels; sweet potatoes, 797,000 bushels; hay, 4,459,000 tons; sugar beets, 538,000 short tons; and cotton, 49,000 bales. Comparative figures for 1913 are: corn, 1,815,000 bushels; wheat, 4,200,000 bushels; barley, 33,150,000 bushels; rice, 293,000 bushels; potatoes, 8,092,000 bushels; hay, 3,600,000 tons; and cotton, 23,000 bales.

Mining. California is one of the most important of the mineral-producing States, and in the value of its products in 1921 ranked third, being surpassed only by Pennsylvania and West Virginia in that year. The most important of its mineral products are petroleum, gold, natural gas, and cement. The development of the petroleum fields of the State has been one of the most important events in the history of mineral production in the country, the extent of this development being shown by a comparison of figures for several of the years in the period 1914 to 1924. In 1914, the production was 99,775,327 barrels, valued at \$48,066,096; in 1916, 90,951,936 barrels, \$53,702,733; in 1918, 97,531,997 barrels, \$118,770,790; in 1920, 103,377,000 barrels, \$178,395,000; in 1921, 112,600,000 barrels, \$203,138,000; in 1922, 138,468,000 barrels, \$173,381,000. On the other hand, the production of gold in the State has decreased, with the exception of one or two years during the decade 1914-24. The production in 1914 was 999,113 fine ounces, valued at \$20,653,496; in 1916, 1,035,745 fine ounces, \$21,410,741; in 1918, 799,588 fine ounces, \$16,528,953; in 1920, 692,297 fine ounces, \$14,311,043; in 1922, 709,077 fine ounces. This decrease was due partly to the exhaustion of a number of the deep mines and to general depression in the gold-mining industry in the last few years. The cement industry has shown a comparatively steady increase during the decade. There were produced in 1914 5,075,114 barrels; in 1916, 5,332,860; in 1920, 7,098,084; in 1921, 7,302,784; and in 1922 8,711,515. The output of natural gas increased from 17,828,928 M. cubic feet in 1914 to 39,718,941 M. cubic feet

in 1918. In 1920, the production was 66,041,000 M. cubic feet, and in 1921, 75,942,000 M. cubic feet. There was produced also a considerable amount of copper, the output varying from 30,507,692 pounds in 1914 to 48,153,139 in 1917; 12,626,272 in 1920; 11,743,404 in 1921, and 22,539,485 in 1922. The silver production of the State has always been important. In 1914 it was 1,471,859 fine ounces; in 1916, 2,564,354; in 1919, 1,107,189; in 1920, 1,706,327; in 1921, 3,629,223, and in 1922, 3,100,065. The State has produced large quantities of lead and zinc. The lead production has varied from 4,251,923 pounds in 1914 to 21,868,028 in 1917; 13,372,049 in 1918; 4,813,510 in 1920; 1,124,276 in 1921, and 6,312,536 in 1922. The zinc production in 1914 was 389,471 pounds, which increased in 1916 to 15,256,485 pounds, fell again in 1919 to 472,990 pounds, then rose in 1921 to 1,037,731 pounds, and in 1922, to 3,012,950. In addition to the minerals mentioned above, California produces asphalt, clay products, stone and many other products of great value. The total value of the mineral production of the State in 1914 was \$101,013,199; in 1918, \$204,673,547; in 1920, \$269,404,686; reaching \$297,025,679 in 1921.

Manufactures. California is an important industrial State. The number of manufacturing establishments increased during the decade from 7659 in 1909 to 10,057 in 1914, and 11,942 in 1919, while the number of persons engaged in manufacture rose from 141,576 to 176,547, and 206,868, in those years. The capital invested in 1909 was \$537,134,359; in 1914, \$730,105,445, and in 1919, \$1,233,480,273. The most important industries are those connected with canning and preserving, California ranking first among the States in the canning of fruits and vegetables. The value of these products in 1909 was \$32,915,000; in 1914, \$61,163,000; and in 1919, \$219,279,000. The value of the products of the petroleum-refining industry, which is second in importance, was \$17,878,000 in 1909; \$55,528,000 in 1914 and \$213,292,000 in 1919. Shipbuilding and boatbuilding, ranking third in the value of its product, had an output in 1909 valued at \$4,132,000; in 1914, \$8,104,000, and in 1919, \$185,882,000; the extraordinary growth from 1914 to 1919 being the result of great shipbuilding operations carried on because of the War. Slaughtering and meat-packing is also an important industry. The value of the product in 1909 was \$34,280,000; in 1914, \$50,012,000, and in 1919, \$94,450,000. The increase in the value of products from 1914 to 1919 is in great measure due to the changes in industrial conditions brought about by the War; a more definite evidence of progress is shown by a comparison of the number of wage earners and of the horse power used, both of which indicate unmistakably a decided growth in the manufactures of the State.

The chief manufacturing cities are San Francisco, Los Angeles and Oakland. In San Francisco, the number of manufacturing establishments, with value of their products, was in 1909, 1796 and \$133,041,000; 1914, 2334 and \$162,300,000; 1919, 2360 and \$417,321,000. Similar figures for Los Angeles were: in 1909, 1325 and \$68,586,000; 1914, 1911 and \$103,458,000; 1919, 2540 and \$278,184,000. The manufacturing establishments of Oakland increased from 441 in 1909 to 573 in 1914 and 593 in 1919, the value of the product in those years being

\$22,343,000, \$28,522,000, and \$134,755,000, respectively.

Education. California has always been among the foremost States in its educational advancement. In 1913, the ex-officio Board of Education was abolished, and was superseded by the State Department of Education, which, however, was handicapped by the fact that it was in a measure double-headed and divided authority between the Superintendent of Public Instruction and the Governor. In 1921, a special legislative committee on education studied the school system of the State with the object of suggesting improvement in the laws to render the educational administration more efficient; and the Legislature of that year passed a law which carried into effect many of the recommendations made by the commission, although it could not alter the administrative form of the educational system, such a change involving a constitutional amendment. The Legislature of 1923 further amended the law of 1921. The total enrollment in the schools of the State in 1914, including kindergarten, elementary, high and normal schools, was 501,921. In 1919, the enrollment in the kindergartens was 20,721; elementary schools, 423,562; and high schools, 95,405. In 1922, the enrollment in kindergartens was 20,061; in the elementary schools, 571,678, and in the high schools, including junior colleges and special schools, 227,270. The total expenditures for elementary schools in 1922 was \$55,704,910; for high schools, \$27,612,854. California's percentage of illiteracy is among the lowest of the States. It decreased from 4.3 per cent in 1910 to 3.9 per cent in 1920; the decrease among native whites being from 0.6 to 0.4 per cent; among the Negroes from 8.4 to 5.6 per cent.

Finance. For finance, see STATE FINANCES.

Political and Other Events. The decade 1914-24 was important in the political history of the State. During this period Hiram W. Johnson rose to a commanding position in the State government and in national affairs. While James D. Phelan, the Democratic candidate for United States Senator, was elected in 1914, Governor Johnson, running on a Progressive ticket, was reelected by a large majority. At this election a proposed prohibition amendment to the constitution was defeated. The Progressives continued to control the State Legislature. A unique departure in legal procedure was the appointment, in 1914, of a public defender in Los Angeles County. His duties correspond roughly to those of the public prosecutor, except that he serves the defendant. He is allowed to accept cases brought to him by those unable to pay a lawyer, in addition to those assigned to him by the court. On Apr. 30, 1914, there was an eruption of Mt. Lassen, a supposedly extinct volcano in the northern part of the State. In the same year serious floods in Los Angeles and other cities resulted in the death of six persons and the loss of property valued at millions of dollars. There were no events of political importance for 1915. In 1916, as a result of area added in the municipal elections, Los Angeles became the largest municipal area in the country. On July 22, 1916, during a preparedness parade in San Francisco, an infernal machine was exploded in the crowd, causing the death of six and the injury of 25. On Jan. 28, 1916, following a six-day storm, the dam at San Diego burst, causing the death of 65 persons and a property loss of \$200,000,000. In the same

period other floods in the State caused great loss. California occupied a prominent place in the presidential election in 1916. The Republican party was divided by factional dispute and as a result the Democratic electors received a plurality of 3373 votes. This result gave the election to President Wilson. For the first time in the history of the State, women voted in 1916 in the presidential campaign. Governor Johnson was elected to the United States Senate. At this election a constitutional amendment providing for prohibition was again defeated. William D. Stephens, lieutenant-governor, became governor of the State on Mar. 10, 1917, succeeding Senator Johnson, who was reelected in 1918. Two prohibition amendments submitted at the election of this year were decisively defeated. The Supreme Court in 1918 upheld the constitutionality of the State primary election law. Aside from the work of the Legislature, there were no special political events in 1919. In 1920 elections were held for United States Senator and certain State officers. Samuel M. Shortridge was elected Senator, defeating J. D. Phelan, Democrat. At this election a prohibition amendment and an act prohibiting vivisection and compulsory vaccination were defeated. In the presidential election of 1920, W. G. Harding received 624,992 votes and J. M. Cox 229,191. A referendum was held on Nov. 2, 1920, on the anti-alien land leasing law passed by the Legislature. This resulted in a vote of acceptance by a majority of over 220,000 votes and the act was declared in force on Sept. 10, 1920. The chief object of this act is to prevent Japanese from owning agricultural land in California. Its effect is to render it impossible for 60,000 or 70,000 residents in the State to lease land in their own right or in behalf of their children. In the State elections held in November, 1922, Friend W. Richardson, Republican, was elected governor and Hiram W. Johnson was reelected to the Senate. Upton Sinclair, the well-known Socialist and writer, as a candidate for the Senate, received 23,668 votes. Governor Richardson assumed office in January, 1923. He demanded, in his inaugural address, strict enforcement of the prohibition act. An investigation into election expenses by corporations was carried on by the State Senate during the year, and several measures were passed to prevent excessive expenditures. On Sept. 17, 1923, a fire in Berkeley caused a property loss of over \$10,000,000. On November 11 of this year the United States Supreme Court declared valid laws prohibiting alien ownership of land in the State. In the presidential primaries held in 1923, President Coolidge was endorsed by the Republican voters and William G. McAdoo by the Democrats. Senator Johnson, who was a candidate, was defeated by President Coolidge.

Legislation. The most important measures enacted by the Legislature during the decade 1914-24 were as follows: The Legislature of 1915 passed a measure abolishing political party distinction from the ballots. This, however, was defeated by referendum later in the year. Attempts to amend the anti-alien land act, passed in 1913, failed. This law was held constitutional by the State court. The Legislature in 1917 enacted several measures relating to the judiciary and the administration of justice. A constitutional amendment was passed providing for a compensation law subject to the approval of the people. A "blue sky" law was also enacted

and a constitutional amendment providing for social insurance. These were also subject to the approval of the people. In 1919 the Legislature appropriated \$1,000,000 for the extension of the State land settlement project including preferential selection of farms by returned service men. A \$40,000,000 highway bond issue was submitted to the people and adopted on July 1. A constitutional amendment providing for a constitutional convention was voted on in November, 1920, and was also passed. This legislature passed also a compulsory education law and created a department of agriculture. It ratified the Federal prohibition law and the woman suffrage amendment. In 1921 the Legislature passed several measures to aid soldiers; reorganized numerous State boards and offices into six administrative departments under the governor; created a small claims court and county public defenders, and enacted a State prohibition enforcement act. In 1923 the Legislature made instruction in the Constitution of the United States compulsory in all schools, amended the workmen's compensation law, and passed an absent voters act.

CALIFORNIA, UNIVERSITY OF. A nonsectarian, coeducational State institution at Berkeley, Cal., founded in 1860. The student enrollment increased from 7526 in 1914 to 13,167 in 1923-24, plus 1645 fully matriculated students not working for regular degrees; the faculty increased from 434 to approximately 1500 members; and the library from 200,000 to 500,000 volumes. The productive funds grew from \$5,540,263.92 in 1914 to \$8,751,962 in 1924, and the annual income from \$2,793,173.74 to \$7,985,179. Five buildings were completed in 1917 from a \$2,000,000 State bond issue. Wheeler Hall, a classroom named for the president of the university; a new wing for the library; Hilgard Hall, an agriculture building; a wing for the chemical laboratory; and a unit for the power plant. In 1923, Le Conte Hall for the department of physics, Hesse Hall, the first unit of a group of buildings for the engineering departments, and the California Memorial Stadium, costing \$1,350,000, were completed, and Haviland Hall for the School of Education was in the course of construction. In 1917, departments of preventive medicine and home economics were established. David Prescott Barrows, Ph. D., succeeded Benjamin Ide Wheeler as president in 1919 and was succeeded in turn in 1923 by William Wallace Campbell, Sc D., LL D.

CALIFORNIA INSTITUTE OF TECHNOLOGY. A nonsectarian institution for the technical education of men at Pasadena, Cal., founded in 1891. The student enrollment rose from 58 in 1914 to 572, of whom 56 were in the Graduate School, in 1924; the library increased from 5185 to 14,893 volumes; and the staff of instruction and research from 22 to 106 members. The productive funds increased from \$576,000 to \$5,505,000, and the income from \$75,000 to \$303,000. The Gates Chemical Laboratory was built in 1917; the east wing of the Norman Bridge Laboratory of Physics was erected in 1917, the central section in 1923, and the west wing in 1924; an auditorium, a high-voltage research laboratory, a research laboratory of applied chemistry, and a temporary building for student activities, were constructed and equipped. Eight acres were added to the campus. The Carnegie Institution (q.v.) of

Washington gave \$30,000 a year for five years for the support of researches on the structure of matter and radiation, under the direction of Dr. R. A. Millikan (q.v.) and Dr. A. A. Noyes. The name of the institute was changed in 1920 from Throop Polytechnic Institute to the form given above. Dr. James A. B. Scherer was president until his resignation in 1920; from that time the administration was in the hands of an executive council, of which Dr. Robert A. Millikan was chairman.

CALIPHATE. The Caliphate or leadership of the Mohammedan world, which had been held by rulers of Turkey since the 16th century, was allowed to lapse on Mar. 3, 1924, when the Turkish Grand National Assembly at Angora deposed Abdul Mejid from the office of Caliph and abolished the institution, at least temporarily, in so far as Turkey was concerned. The Caliphate immediately became the subject of international intrigue and universal discussion. The spiritual and temporal powers which the Turkish Sultans had enjoyed as Caliphs have often been exaggerated, even to the point of erroneously comparing the Caliphate to the Papacy. In theory, to be sure, the Caliph was the representative or vicegerent of the prophet Mohammed, guardian of the sacred law of Islam, defender of the faith, and spokesman of some 300,000,000 Mohammedans. As a matter of fact, although for a while after Mohammed's death, A.D. 632, the Caliphs enjoyed great prestige, the office was not recognized by the large body of schismatic Shahs in Persia and elsewhere, nor did it in modern times command much more than nominal respect among non-Turkish Mohammedan populations. It was a mere shadow when it was taken by Sultan Selim I from the last of the Abbasids, in the sixteenth century, to become hereditary in the house of Othman. Abdul Hamid II used it as a convenient instrument to strengthen his political pretensions and to enlist support from Mohammedans outside his empire, and the dramatic German Emperor William II generously but inaccurately referred to the Sultan "whom 300,000,000 Mohammedans throughout the world revere as the Caliph"; but after the revolution of 1908 and the rise of the Young Turks, the artificially inflated prestige of the Caliphate was punctured by a series of inglorious wars and by Arab revolts against the Pan-Turanian policies of the Young Turk leaders. The Young Turks, indeed, were willing to use the Caliphate for their own nationalistic ends, but placed little confidence in its dubious vitality.

The outbreak of the War made the use of sentiment once more desirable. To rally the Islamic host to the aid of Turkey, the Sultan, Mohammed V, in 1915 was induced to become once again the head of a militant Caliphate and to proclaim the dreaded Jihad or Holy War. The Holy War failed outside of Turkey, for Arab, Berber, and Indian Mohammedans fought in the Allies' cause, it became increasingly evident to the West that the Caliph's position, heretofore magnified by the Powers in the interests of their own policies, was really sadly insecure. For Mustapha Kemal and the Nationalist Turks, after the War, the institution of the Caliphate possessed no attraction. It is difficult to say whether, in their admiration for western institutions, the Nationalists did not lean too far over to the left, and in pretending a lack of sympathy for religious ideas, tend to minim-

ize the hold that Mohammedanism still had on the great masses of the Turkish population. At any rate, action was drastic. After the Mudania Convention had given Constantinople into their hands, the Nationalists, on Nov. 2, 1922, deposed the Sultan-Caliph, Mohammed VI, and abolished the Sultanate. They named Abdul Mejid Caliph, but they sheared the office of all its temporal power. Islam was made to realize that Turkey merely waited for a propitious moment to rid herself of the Caliphate altogether. The too eager interest of Indian Mohammedans furnished the opportunity. After the War, Indian extremists worked heroically for the resurgence of the Caliphate's high dignity, not in the interest of Turkey but rather in that of an independent India. The appeal was frankly religious and sentimental; around Nationalist Turkey, which had successfully defied Great Britain, crystallized a myth of the new Mohammedan leader who was to guide the Islamic world back to its former greatness. The Nationalists regarded such talk with suspicion. To them, in an agitation of this kind, the way seemed easily left open for foreign interference in Turkish affairs. When the well-intentioned Indian Mohammedans, the Aga Khan and Ameer Ali, in a letter to Ismet Pasha, the Turkish Premier, on Nov. 24, 1923, urged on the Angora government the necessity for upholding the power of the Caliphate, summary action was decided on. The so-called tribunal of independence was appointed to try the Constantinople editors whose papers were alleged to have published the letter before Ismet Pasha had even received it. And then, in the debate on the budget in the Assembly, on Mar. 1, 1924, Mustapha Kemal demanded the abolition of the Caliphate. Two days later the Assembly complied, and on the next day Abdul Mejid and his son were bundled across the European frontier. To indicate how completely secular and religious affairs were henceforth to be sundered, drastic measures were enacted providing for the seizure of effects and estates belonging to the deposed Othman family, the confiscation of all the property of the Pious Foundations, the subordination to the civil authorities of the law administration based on the Koran, and the abolition of religious schools. Turkey thus parted with her past and frankly accepted Occidental standards. Whether the loss of the prestige which the Caliphate had formerly conferred on her would militate against Turkey's influence remained to be seen. The interesting question to be determined was whether Turkey, now that she had voluntarily relinquished her place as a first rate eastern power, would become, with her diminished population and her broken economic life, merely a third rate western state, or the great driving force of her leaders could succeed in raising her to a commanding position in world affairs. The abolition of the Caliphate threw an apple of discord among Moslems, and among the imperialist Great Powers. Hussein, King of the Hedjaz, with the implicit support of the British government, immediately announced his candidacy. The French looked favorably on the ambitions of the Sultan of Morocco. Other aspirants were King Fuad of Egypt, the Amir of Afghanistan, and the Aga Khan. British diplomacy triumphed when the Arabs of Mesopotamia, Transjordan, and the Hedjaz, on Mar. 7, 1924, formally proclaimed Hussein Caliph. But the matter was by no

means settled, for France and Italy, because of their colonial Mohammedan populations, were too deeply concerned to be ready to accept an initial setback as final defeat, and Indian Mohammedans, most interested in the survival of the Faith which the Caliphate had represented, refused to commit themselves. This aloofness was perhaps more disquieting than the noisy debates of the French and Italian press. At any rate, in 1924 it was perceptible that the problem of the Caliphate had rent wide open the world of Islam and again revealed the fundamental differences existing among Turks, Arabs, and Indians. See, also, **TURKEY**; **PAN-ISLAMISM**; and **PAN-TURANIANISM**.

CALKINS, RANSOM M. (1863-). An American railway official, born at Ogdensburg, N. Y. He was educated in the public schools of that city and began his railway service with the Chicago, Milwaukee and St. Paul Railroad in 1879. He rose through various grades with that road and in the years following served with many important railways in the West, chiefly as traffic manager. He served in this capacity with the Chicago, Milwaukee and St. Paul Railroad from 1913 to 1917 and was made president of that road in 1918. In 1920, he became president of the Chicago, Milwaukee and Southern Pacific Railway.

CALLAN, JOHN GURNEY (1875-). An American mechanical engineer, born in Northfield, Conn. He graduated from the Massachusetts Institute of Technology in 1896 and for several years was with the General Electric Company and with the Arthur D. Little Company of Boston. He was professor of steam and gas engineering at the University of Wisconsin from 1915 to 1920, and from the latter date was professor of industrial management of the Graduate School of Business Administration at Harvard. He took about 70 patents, chiefly in connection with steam turbines, and was a member of several scientific societies.

CALLES, PLUTARCO ELIAS (?-). A Mexican public official, born in the State of Sonora, and at one time governor of that State. He was a close associate of President Obregon, who was born in the same State, as was also Adolfo de la Huerta. Calles became Secretary of the Interior in Obregon's Cabinet, and had the backing of the Labor party. In August, 1923, when the recognition of Mexico by the United States was consummated, Calles resigned from the Cabinet in order to conduct his campaign for the nomination to the presidency. During the last week of August, the Labor party held its convention and he was nominated. He had the support of the administration, and also of the Yucatan Socialist party, and the radical Agrarian party. A month later the Coöperative party nominated de la Huerta, and a bitter fight began which soon led to revolution (see **MEXICO**). The government was finally victorious, and on Mar. 25, 1924, Calles resigned from the army and resumed his candidacy for the presidency. He reaffirmed his previous declarations regarding social problems in Mexico and offered to continue the social policies of President Obregon. He was elected president of Mexico in July, 1924.

CALLOWAY, ALFRED W. (1872-). An American coal operator, born in Manchester, England. He came to the United States in 1892 and was educated in the public schools of Brooklyn, N. Y. He was employed in many important

capacities in several railroads and from 1913 was president of the Davis Coal and Coke Company, of Baltimore. From 1917, he was also president of the Pittsburgh Terminal Railway Company and was director and official in many important coal-mining and other corporations.

CALMETTE, ALBERT (1863-). A French bacteriologist and sanitarian, born at Nice. He received the degree of M.D. from the University of Paris in 1886 and spent some years as surgeon in the French navy. He devoted himself to bacteriological and hygienic work and was awarded the task of founding and directing a branch Pasteur Institute in Saigon (1889). Resigning from the navy, he was appointed director of the Pasteur Institute at Lille and remained until the death of Metchnikoff, when he succeeded Roux as assistant director of the Paris institute. Calmette's chief publications are along such dissimilar lines as snake venoms, sewage purification, tuberculosis and miners' anæmia. They are as follows: *Recherches sur l'épuration biologique et chimique des eaux d'égout*, 8 vols. (1905-14); *Recherches expérimentales sur le tuberculose* (1907-14); *Les venins, les animaux venimeux et la sérothérapie antivenimeuse* (1907); in English translation, (1908); also with Breton, *L'Ankylostomiase* (1905); and (with Imbeaux and Poitevin) *Egouts et vidanges, ordures ménagères, cimetières*. 2 vols. (1911).

CALVERT, LOUIS (1859-1923). An English actor born in Manchester who made his first appearance at the Theatre Royal at Dublin, Natal, in 1878. During 1888-89 he toured in America with Mrs. Langtry and in conjunction with Martin Harvey and William Haviland took out the Lyceum Vacation Company. He toured with Miss Fortescue and Ben Greet's company and in 1890 formed his own company and produced Shakespearian plays. From 1915 to 1919 he was in America, where he became famous as Matey in *Dear Brutus* (1918). When he returned to Wimbledon in October, 1919, he began his part in *Daddalums* and later toured in that play. In 1921, he played Caliban in *The Tempest* and in the next year was best known for his presentation of the Baron in *He Who Gets Slapped*. He died July 18, 1923. Among his books were *An Actor's Hamlet* and *Problems of the Actor*.

CALVERT, PHILIP POWELL (1871-). An American zoölogist born at Philadelphia, Pa. He was educated at the University of Pennsylvania (Ph.D., 1885), and at Berlin and Jena. He was assistant instructor in zoölogy at the University of Pennsylvania (1892-97), instructor (1897-1907), assistant professor (1907-12), and professor (1912-). Professor Calvert traveled extensively in Mexico and Central America, and his scientific publications were mainly studies on the dragon flies of Central America.

CALVIN, EDGAR EUGENE (1858-). An American railway official, born in Indianapolis. He was educated in the public schools of that city and began his railroad career as telegraph operator in the Indianapolis, Cincinnati and Lafayette Railroad, in 1875. He entered the service of the Union Pacific Railway in 1882, rising to the office of trainmaster. He served as general superintendent and general manager in several important railways in the West, and in 1916 was appointed president of the Union Pacific Railroad. During the War he acted as

Federal manager for many important roads and from 1920 was vice-president of the Union Pacific System Lines.

CAMBODIA. See FRENCH INDO-CHINA.

CAMBON, JULES MARTIN (1845-). A French diplomat (see VOL. IV). Having been French ambassador in Berlin until the outbreak of the War, his knowledge of German affairs was very valuable to France. He was appointed General Secretary for Foreign Affairs during M. Briand's war premiership. He was elected to the French Academy in 1918, and received into that body the following year.

CAMBON, PIERRE PAUL (1843-1924). A French diplomat, (see VOL. IV), member of the *Institut* (Académie des Sciences, Morales et Politiques). He was largely influential in frustrating Germany's efforts to separate France and England in 1914. He also did much during the peace negotiations to keep France and Great Britain on good terms. He resigned as French Ambassador to England in November, 1920, and died at Paris, May 28, 1924.

CAMBRAT, BATTLE OF. See WAR IN EUROPE, *Western Front*.

CAMBRIDGE. A city of Massachusetts. The population rose from 104,839 in 1910 to 109,694 in 1920 and to 111,444 by estimate of the Bureau of the Census for 1923. Contracts were let in 1921 for a 14,000,000 gallon water-purification plant of the mechanical or rapid-filter type, the first of its kind for general purposes in Massachusetts. The number of industrial establishments increased from 270, representing 243 industries in 1916, capitalized at \$67,000,000, employing 20,000 persons, and producing goods valued at \$60,000,000, to 338, representing 250 different industries in 1923, employing 27,000, and producing goods valued at \$156,430,827. Deposits in savings banks rose during the period from \$22,500,000 to \$30,000,000; bank assets in 1923 were \$125,000,000.

CAMDEN. A city of New Jersey on the Delaware River opposite Philadelphia. Its population rose from 94,538 in 1910 to 116,309 in 1920, and to 126,309 by estimate of the Bureau of the Census for 1924. The commission form of government was adopted in 1923, in 1924, a city plan was under consideration. Work was begun in 1921 on a suspension bridge between Camden and Philadelphia (q.v.), to cost \$28,000,000. The main span was to be 1750 feet in length, with an underclearance of 135 feet; the whole length was to be 1.82 miles. Broadway was to be opened through to the bridge approach. A municipal pier was built, a civic centre plan was under way, a community hotel, to cost \$1,250,000, was begun. In 1924, \$6,000,000 was being expended on new city boulevards; the same year the Philadelphia and Reading Railroad opened a new \$3,000,000 terminal with 14 tracks.

CAMEROON, BRITISH. A British mandate territory formerly a part of the German Kamerun (q.v.), on the west coast of Central Africa stretching from the sea along the Nigerian frontier to Lake Chad. Area, 33,700 square miles; population, 664,000. While the territory was administered from Nigeria, independent accounts were maintained. Up to 1923 the developments had been slight, and the deficit incurred in administration steadily mounted. In 1921, revenues were £52,000 and expenditures £102,000. The leading exports in 1921 were palm products, rubber, ivory, cocoa, and totaled £34,000. Im-

ports totaled £49,000. In 1921, 67 vessels of 100,000 tons entered Victoria. The mark was used until July 1, 1922, and then was replaced by British currency.

CAMEROON, FRENCH. A French mandate territory on the west coast of Central Africa, formerly the German Kamerun (q.v.). Area, 166,489 square miles and population about 2,000,000. By decree of March, 1921, the territory was given autonomy and a seat of government in 1921 was erected at the inland town of Yaoundé (population 30,000). Duala, the chief port, had about 18,000 inhabitants. The Commissioner of the Cameroon sat on the council of the governor of French Equatorial Africa, and thus common action was assured. The budget for 1922 balanced at 17,292,000 francs. A special railway budget included 3,380,000 francs. The leading products were coffee, tobacco, palm oil, and ivory, and netted an export value of 22,498,333 francs in 1921. Imports were 32,581,277 francs. In 1921, 188 vessels, four-fifths of them French, entered the port of Duala. The territory had 359 miles of railway in 1922, and 213 miles of roads. A railway from Duala to Yaoundé was in the course of construction.

CAMMAERTS, ÉMILE (1878-). A Belgian poet born at Brussels. In 1908, he went to England where he continued to live, remaining a Belgian subject. Among his French works are translations of John Ruskin and G. K. Chesterton; two plays, *Les Deux Bossus* and *La Veillée de Noël*; and *Poèmes Intimes* (1922). He also wrote: *Les Bellini—An Essay in Art Criticism*; *Belgian Poems* (1915); *New Belgian Poems* (1917); *Through the Iron Bars* (1917); *Messines and other Poems* (1918); *Belgium, From the Roman Invasion to the Present Day* (1920); and *The Childhood of Christ as seen by the Primitive Masters* (1922). Cammaerts's poems written during the War and his *Through the Iron Bars*, which recounts the sufferings of Belgium in that period, won for him a wide popularity.

CAMOUFLAGE OF VESSELS. See WAR IN EUROPE.

CAMP, WALTER (1859-1925). An American authority on athletics (see VOL. IV). He is author of the following: *Auction Up-to-Date* (1914); *Captain Danny* (1914); *Danny, the Freshman* (1915); *Keeping Fit All the Way* (1919); *Spalding's Official Football Guide* (1920); *Football Without a Coach* (1920); *Handbook on Health and How to Use It* (1920); *Daily Dozen* (1921); *Training for Sports* (1921); and *How to Play Football* (1922).

CAMPBELL, BEATRICE STELLA TANNER (Mrs. PATRICK) 1867-). An English actress (see VOL. IV). She came to America in 1914 and toured in Shaw's *Pygmalion*. The next year she played *The Second Mrs. Tanqueray* and Mrs. Blaine in *Searchlights*. She returned to London and among her best roles was Lady Macbeth (1920), played to James K. Hackett's *Macbeth*. In 1914 she married George F. M. Cornwallis-West.

CAMPBELL, EDWARD DE MILLE (1863-). An American chemist (see VOL. IV). In 1917, he was consulting chemist of the United States Ordnance Department at large. He wrote many articles on chemical and allied subjects, and was a member of many scientific societies.

CAMPBELL, HENRY DONALD (1862-). An American geologist, born at Lexington, Va. He was graduated at Washington and Lee Uni-

versity where he received the degrees of A.M. in 1882 and Ph.D. in 1885. He also studied in 1886-87 at Berlin and in 1887-88 at Heidelberg. In 1882, he was made an instructor in chemistry and geology at Washington and Lee and in 1888 attained the chair of geology and biology, but in 1920 he gave attention to geology only. Dr. Campbell served as dean of the academic faculty during 1906-08 and in 1908 became dean of Washington and Lee University. He is an authority on the geology of West Virginia and on the Mesozoic diabases of the Atlantic border.

CAMPBELL, OSCAR JAMES, JR. (1879-). An American educator, born at Cleveland, Ohio. He was professor of English at the University of Wisconsin from 1911 to 1921, and in 1921 became professor of English at the University of Michigan. In 1918, the United States government commissioned him to collect information about Turkey to be used at the Peace Conference. His writings include: *The Comedies of Holberg* (1914); *A Book of Narratives* (with R. A. Rice) (1917); *The Position of the Roode en Witte Roos in the Saga of Richard III* (1919).

CAMPBELL, MRS. PATRICK. See CAMPBELL, BEATRICE STELLA TANNER.

CAMPBELL, WILLIAM (1876-). An English metallurgist, born at Newcastle on Tyne, England. He was graduated at the Durham College of Science in 1898, where he also received degrees in 1903 and in 1905. After a year at the Royal School of Mines in London as Research Scholar, he came to New York and studied at Columbia, receiving his Ph.D. in 1903. He lectured on geology and metallurgy at Durham, and in 1903, became a lecturer on geology at Columbia where in 1917 he became full professor of metallurgy. During 1907-11, he was metallographer to the United States Geological Survey and after 1911 he held a similar relation to the Bureau of Mines. After 1913, he also lectured on metallurgy to the postgraduate school of the United States Naval Academy. He has given special attention to the micro-structure and physical properties of metals and alloys and has studied the influence of heat and the mechanical treatment on the structure and properties of iron and steel and other alloys. During the War he served with the National Research Council on his specialties.

CAMP FIRE GIRLS. An organization for girls founded in 1912 for the purpose of promoting good health and better citizenship by providing a programme of wholesome and pleasant outdoor activities, and of service. Between the date of its foundation and 1924 the organization spread into every State and territory of the United States, and to 21 foreign countries located on every continent. Twenty-five per cent of the camp fires were organized as part of school systems, and 75 per cent in connection with churches. Six and one half per cent of the members were of foreign parentage. Six hundred thousand girls followed the programme in the ten years between 1914 and 1924; the membership increased from 35,980 in 1916 to 160,000 in 1923. In 1923, 100,000 girls camped out. The same year 70 training courses for leaders were held in universities, colleges, normal schools, and camps, and 42 trained local executives directing activities in their given localities were paid by their communities. During the War 90 per cent of the members were engaged in War activities.

CANADA. A British dominion in the northern half of the North American continent, bounded on the west by the Pacific Ocean and Alaska; on the south by the United States; on the east by the Atlantic Ocean, the Gulf of St. Lawrence and Davis Strait; and on the north by the Arctic Ocean. The total area of Canada is 3,729,665 square miles, consisting of 3,603,336 square miles of land and 126,329 square miles of water. The sixth census of the Dominion of Canada shows the total population on June 1, 1921, as 8,788,483, as compared with 7,206,643 on June 1, 1911, an increase of 1,581,840, or 21.95 per cent in the decade. From 1911 to 1921, there occurred in the four western provinces an increase of population from 1,720,601 to 2,480,664 or 44.2 per cent, while the five eastern provinces increased from 5,471,023 to 6,295,189, an increase of 824,166 persons, which, though absolutely larger than the figure for the west, constituted an increase of only 15 per cent over the 1911 population. Ontario and Quebec still contained the major portion of the population; in 1921, 60 per cent as compared with 63 per cent in 1911. The density of population in Canada was 2.44 to the square mile. In 1921, the ratio of males to females was 515 males to 485 females per 1000 of population, as compared to 530 males to 470 females per 1000 in 1911. The decline was accounted for by the loss of 60,000 Canadian men during the War and the checking of immigration. Of Canada's total population, 4,436,041 or 49.52 per cent were classed as rural in 1921, as compared with 3,933,696 in 1911. The urban population numbered 4,352,442 in 1921 and 3,272,947 in 1911. In 1921, there were only 83,599 more persons in the rural communities than in the urban; in 1911, the excess was 660,749. The census of 1921 showed that for the first time Canada possessed cities of more than a half million population. These were Montreal and Toronto. Populations of important cities in 1921, with 1911 shown in parentheses, were: Montreal, 618,506 (490,504); Toronto, 521,893 (381,833); Winnipeg, 179,087 (136,035); Vancouver, 117,217 (100,401); Hamilton, 114,151 (81,969); Ottawa, 107,843 (87,062); Quebec, 95,193 (78,710); Calgary, 63,305 (43,704); London, 60,959 (46,300); Edmonton, 58,821 (31,064); Halifax, 58,372 (46,619). Births in 1921 were 257,728, marriages 69,732, and deaths 101,155. Immigrant arrivals in 1923 totaled 72,887, of whom 22,007 came from the United States and 34,508 from the United Kingdom. In 1913, immigrant arrivals totaled 402,432; of whom 139,009 came from the United States and 150,542 from the United Kingdom. The racial distribution of the population was, in percentages: English, (1921) 28.96 and (1911) 25.30; Irish, (1921) 12.60 and (1911) 14.58; Scotch, (1921) 13.36 and (1911) 13.85. The total population of the British races was 54 per cent in 1911 and 55 per cent in 1921.

Education. Throughout the Dominion of Canada public education was a matter of provincial concern. In Quebec there were two distinct systems of education in each of which the teaching of religion occupied a prominent position—the Protestant and the Roman Catholic systems. In the academic year ended in 1922, there were 2,123,618 pupils in attendance at educational institutions in Canada, or 24.2 per cent of the 1921 population. Of the above, 1,860,760 were enrolled in ordinary day school

under public control, the average daily attendance numbering 1,377,423; in 1911, 1,350,821 pupils were enrolled, the average attendance being 866,956. Pupils attending vocational school numbered 80,549 in 1922. There were 23,929 students in private business colleges, and 71,504 in other private schools under college grade. University students in regular courses numbered 18,245 and college students in regular courses 5902. Students in classical colleges numbered 9502. There were, in 1922, 59,312 teachers in schools under public control, 10,596 males and 48,716 females; in 1911, there were 40,502 teachers. The total expenditures on schools under public control was \$107,685,069, of which governments contributed \$13,934,113, and local taxation most of the balance. Higher education in Canada was carried on in 23 universities and 65 colleges, including 21 classical colleges in Quebec. Of the universities, six were state controlled (New Brunswick, Toronto, Manitoba, Saskatchewan, Alberta, and British Columbia); four others were undenominational (Dalhousie, McGill, Queen's and Western); while the remainder were denominational. The number of students registered in universities during the year 1922 was 10,821 in state controlled institutions (teaching staff, 1038); 6074 in other undenominational institutions (staff, 674); and 14,267 in denominational institutions (staff, 1425); making a grand total of 31,792 with a teaching staff of 3137.

by lower prices applicable to almost every crop. The total value of all field crops in 1913 was \$552,771,500. Canada's most important crop was wheat, the total yield for the year 1923 being finally estimated at 474,199,000 bushels from an area of 22,671,864 acres, as compared with 399,780,400 bushels from 22,422,693 acres in 1922, and with 231,717,000 bushels in 1913 from 11,015,000 acres. The wheat crop of 474,199,000 bushels in 1923 was the largest on record for Canada, and compared with 399,786,400 bushels, last year's record crop, and with 393,542,600 bushels, the previous record crop of 1915. The average yield per acre for all wheat in 1923 was 21 bushels, as compared with 17¾ bushels in 1922, 26 bushels in 1915, and 21 bushels in 1913. Oats yielded in 1923 the total of 563,997,500 bushels from 14,387,807 acres, as compared with 491,239,000 bushels from 14,541,229 acres in 1922, and with 404,669,000 bushels from 10,434,000 acres in 1913. The average yield per acre was 39¼ bushels in 1923, 33¾ bushels in 1922, and 38.78 bushels in 1913. The total crop for 1923 was the highest on record, the previous record being 530,709,700 bushels in 1920. Barley yielded the total of 76,997,800 bushels from 2,784,571 acres, as compared with 71,865,300 bushels from 2,599,520 in 1922 and with 48,319,000 bushels from 1,613,000 acres in 1913. The average yields per acre were 27¾ bushels in 1923, 27¼ bushels in 1922, and 29.96 bushels in 1913.

	1913		1922		1923	
	Area Acres	Yield Cwt.	Area Acres	Yield Cwt.	Area Acres	Yield Cwt.
Potatoes	473,500	47,126,400	683,594	55,745,300	560,942	55,497,000
Turnips, mangolds, etc	186,400	40,072,800	224,256	43,973,500	194,512	38,116,500

Agriculture. The economic prosperity of Canada continued dependent primarily upon agriculture. Farm products comprised 55 per cent of Canadian exports, the most important being wheat and flour, pork products and dairy products. The total area under field crops in 1923 was 56,569,794 acres, as against 57,189,681 in 1922, and 35,375,430 in 1913. The total values of field crops for 1913, 1922, and 1923 were estimated as follows:

	1913	1922	1923
Wheat	\$156,462,000	\$339,419,000	\$316,934,700
Oats	128,893,000	185,455,000	184,857,400
Barley	20,144,000	33,335,300	32,570,700
Rye	1,524,000	18,703,200	11,339,900
Peas	4,382,000	5,818,200	4,987,400
Beans	1,505,000	3,713,800	2,773,000
Buckwheat ..	5,320,000	8,140,800	8,191,700
Mixed grains ..	8,685,000	16,500,700	17,654,800
Flax seed ..	17,084,000	8,638,900	12,643,900
Corn for husking ..	10,784,300	11,509,700	12,466,000
Potatoes ...	38,418,000	50,320,000	56,397,800

Hay and clover ...	124,696,000	194,950,000	162,882,000
Alfalfa	2,819,200	10,295,000	11,914,000
Grain hay	15,063,800
Fodder corn ..	12,506,000	29,197,600	24,605,000
Sugar beets ..	906,000	1,500,000	1,401,000

The aggregate value of all field crops in 1923 was \$899,166,200, as compared with \$962,293,200 in 1922, a decrease of \$63,127,000, caused mainly

Flaxseed in 1923 yielded 7,130,500 bushels from 629,938 acres, as compared with 5,008,500 bushels from 565,479 acres in 1922 and with 17,539,000 bushels from 1,522,800 acres in 1913. The yield per acre was 11.30 bushels in 1923 as against 8.85 bushels in 1922 and 11.30 bushels in 1913. The total yields of root and fodder crops, in 1923, as compared with 1922 and 1913, are given in the above table.

For the year 1923, the estimated quantities and values of various fruits produced commercially in Canada were as follows, the corresponding figures for 1922 and quantities only for 1910 being given, if available: apples, (provisional estimate) 4,063,719 barrels, no estimate of value as yet, (5,048,405 barrels, value \$24,692,182; 10,618,666 bushels); pears 227,335 bushels, value \$550,587, (461,227 bushels, value \$668,854; 504,171 bushels); plums and prunes, 348,482 bushels, value \$916,050, (408,438 bushels, value \$522,393; 508,994 bushels); peaches 403,660 bushels, value \$916,050 (577,561 bushels, \$668,854; 646,326 bushels); cherries 203,125 bushels, value \$722,440, (202,740 bushels, \$481,850; 238,974 bushels). The gross agricultural wealth of Canada for 1923 was estimated to be \$7,365,013,000, as compared with \$6,774,461,000 in 1922. The total estimated agricultural revenue of Canada in 1923 was \$1,342,132,000, as compared with \$1,389,289,000 in 1922, \$1,383,958,000 in 1921, \$2,011,201,000 in 1920, and \$2,109,291,000 the peak year in 1919.

The numbers of farm live stock for the Dominion were estimated as follows, the corresponding numbers for 1922 and 1913 (where available) being given within parentheses: horses, 3,530,641 (3,648,871; 2,866,008); mules, 8722 (9202), cattle, 9,246,231 (9,719,869; 6,849,433); sheep, 2,753,860 (3,263,525; 2,598,470); swine, 4,405,316 (3,915,684; 2,753,964); poultry, 45,469,292 (42,930,502), rabbits in British Columbia 48,359 (51,623). All descriptions of farm live stock showed a decrease in 1923, excepting swine and poultry, which increased. The total production of farm eggs in Canada for the year 1923 was approximately 202,186,508 dozen, as compared with 194,058,468 dozen in 1922, and 123,071,034 dozen in 1910, the total estimated value being \$48,770,780 in 1923, as compared with \$48,490,578 in 1922. The total production of wool in Canada from 2,755,273 sheep and lambs in 1923 was placed at 15,539,416 pounds, as compared with 18,523,292 pounds from 3,262,626 sheep and lambs in 1922, and 6,933,955 pounds in 1913.

Forestry. The total land area of Canada is approximately 3,600,000 square miles. The area covered by existing forests covered approximately 950,000 square miles, some of which was agricultural land. The estimated stand of timber of merchantable size in Canada in 1922 was 141 billion cubic feet, of which 102 billion cubic feet was softwood and 39 billion hardwood. The manufacture of lumber, lath, shingles, and other products and by-products of the sawmill, formed the principal industry in Canada depending on the forest for its raw materials. The lumber cut in 1921 was 2,869,307 thousand feet board measure, valued at \$82,448,585; shingles cut 2,986,580 thousand feet, value \$10,727,096, lath cut 804,449 thousand feet, value \$4,188,121; in 1913 the lumber cut was 3,816,642 thousand feet, value \$65,796,438; shingles cut 1,485,279 thousand feet, value \$3,064,641; lath cut 739,678 thousand feet, value \$1,783,283. The total value of all classes of forest products in 1921 was \$218,270,769, as compared with \$312,683,509 in 1920, and \$177,120,000 in 1913. The pulp and paper industry of Canada made rapid progress in the last two decades. In 1924, there were in existence in Canada about 50 pulp mills, 35 combined pulp and paper mills, and 40 mills making paper only, although not all of these were operating; in 1901, there were 25 mills all told. The industry in Canada included three forms of industrial activity, i.e. the operations in the woods with pulpwood as a product, the manu-

mills, 1,109,034 cords; exported unmanufactured 1,035,030 cords. After 1902 the exports of raw pulpwood went exclusively to the United States, and amounted annually to about 1,000,000 cords. The total pulp production in 1922 was 2,150,251 tons, value \$84,947,598, the amount of mechanical pulp produced was 1,241,185 tons, value \$31,079,429; and the amount of chemical fiber, 897,533 tons, valued at \$53,615,692. The earliest accurate detailed statistics available concerning the industry were those of 1917, when the total pulp production was 1,464,308 tons, valued at \$65,515,335; in 1913, the total production was 854,624 tons. Canada's paper production in 1922 was 1,366,815 tons, valued at \$106,260,078; in 1917, production was 853,689 tons, valued at \$58,750,341. The United States market absorbed annually about four-fifths of Canada's pulp and paper shipments, and two-thirds of the newsprint paper consumed in the United States was either of Canadian manufacture or was made from wood or wood pulp imported from Canada. Exports of wood pulp to the United States in the year ended Mar 31, 1923, totaled 12,853,589 cwt., valued at \$26,595,387; exports of pulpwood amounted to 1,090,462 cords, valued at \$10,755,655; and exports of paper were valued at \$70,054,256. During 1923, a Royal commission was appointed to inquire primarily into the pulpwood resources of the Dominion and the expediency of prohibiting export from freehold lands. The commission held sittings throughout Canada and was expected to make its report during the 1924 session of Parliament.

Fisheries. The total value of the products of the Canadian fishing industry in the calendar year 1921 was \$34,931,935, compared with \$49,241,339 for 1920, and with \$33,207,748 in 1913. This was the lowest since 1914, and \$25,000,000 below the record year of 1918. In 1921, the total capital invested in the fisheries was \$45,669,477. The number of employees engaged in the primary operations of fishing was 55,230 in 1921, and in canning and curing establishments, 14,104; a total of 69,334. Perhaps 60 per cent of the annual capture was an average export, of which the United States took approximately one-half, and Great Britain one-quarter. In the fiscal year 1922-23, total exports amounted to \$27,557,717, of which \$13,057,031 went to the United States and \$3,675,202 to Great Britain.

Minerals. The value of the mineral production of Canada for 1923 was (the production in 1922 and 1913 is shown in parentheses): metal-

		Quantity		Value	
		1913	1923	1913	1923
Coal	tons	15,012,178	17,132,536	\$37,324,940	\$74,269,000
Gold	ounce	802,973	1,179,500	16,598,923	24,382,000
Nickel	pound	49,676,772	61,444,000	14,903,032	18,433,000
Copper	pound	76,976,925	86,312,000	11,753,606	12,515,000
Silver	ounce	31,845,803	18,312,000	19,040,924	10,944,000
Lead	pound	37,662,703	112,600,000	1,754,705	7,882,000
Asbestos	tons	161,086	3,849,925	7,508,138
Natural gas	thousand feet	20,477,838	3,809,381	5,875,150
Cobalt	pound	928,383	605,589	2,753,157
Pig iron	tons	1,128,967	880,018	16,540,012
Cement	barrel	8,658,805	7,652,000	11,019,418	14,291,000

facture of pulp, and the manufacture of paper. The total production of pulpwood in 1922 was 3,923,940 cords, valued at \$50,735,361, of which 2,912,608 cords were used in Canadian pulp mills and 1,011,332 cords were exported unmanufactured. In 1913, total production was 2,144,064 cords, value \$14,313,939; used in Canadian pulp

lics, \$84,187,783 (\$62,120,291; \$66,361,351); non-metallics, \$92,838,961 (\$82,642,210; \$79,273,461); structural materials and clay products, \$36,993,088 (1922, \$39,534,741). For principal products of the mineral industry in 1923, as compared with 1913, see above table.

Manufactures. According to the census of

1921, there were in Canada 41,323 manufacturing establishments, as compared with 19,218 in 1910. In 1921, the total number of employees was 517,141, the amount of capital invested \$3,210,709,288, and the output was valued at \$2,747,926,675. In 1910, the total number of employees was 515,203, capital \$1,247,583,609, and output \$1,165,975,639. The cost of materials was \$1,446,304,122 in 1921, leaving \$1,301,622,553 as the value added by manufacture, in 1910, the cost of materials was \$601,509,018 and the value added by manufacture, \$564,466,621. The salaries and wages of employees in 1921 was \$581,402,385, as compared with \$283,311,505 in 1910.

Commerce. The trade of Canada during the fiscal year ending Mar. 31, 1923, showed a marked increase in value as well as in volume, compared with that for the previous fiscal year, 1922. The total value of the imports for the fiscal year 1923 was \$802,465,043, for 1922, \$747,804,332; and for 1914, \$619,193,998; while the exports of Canadian produce in 1923 were valued at \$931,451,443, in 1922 at \$740,240,680, and in 1914 at \$431,588,439. Of Canada's total trade, 55 per cent was with the United States and 30 per cent with the United Kingdom. In 1923, the total trade with the United States amounted to \$909,997,650, imports accounting for \$540,917,432 of this amount, and exports for \$369,080,218, while in 1922 the trade totaled \$808,540,839, imports amounting to \$515,958,196 and exports to \$292,588,643. In 1914, the total trade with the United States was \$559,674,963, imports from the United States being valued at \$396,302,138 and exports to the United States at \$163,674,963. Imports from the United States were greater than in 1914 by \$144,615,294 and exports to the United States by \$205,707,393. The trade of Canada with the United Kingdom during the year ending Mar. 31, 1923, amounted to \$520,355,116; imports amounted to \$141,287,671, and exports to \$379,067,445. During 1922, the total trade was valued at \$416,497,018, the imports accounting for \$117,135,343 of this amount, and exports for \$299,361,675, and during 1914 the total trade was valued

at \$416,497,018, of which imports amounted to \$117,135,343 and exports to \$299,361,675.

Comparing the trade of Canada for 1923 with a normal pre-war year—i.e. 1914—it will be found that the interchange of merchandise increased about 70 per cent. The increase in exports was considerably in excess of the increase in imports. The accompanying table shows a comparison of Canadian imports and exports of principal commodities in 1923 with 1914.

During the year ended Mar. 31, 1923, the trade balance was favorable to Canada by \$142,830,794, as compared with a favorable balance in 1922 of \$6,122,677, and an unfavorable balance in 1921 of \$29,730,763, and, for the pre-war year 1914 of \$163,756,774. From 1916 to 1920, Canada's exports exceeded her imports each year by a very large amount, due principally to abnormal conditions which existed during the war period and the reconstruction period following the termination of hostilities. Prior to 1916, the trade balance was unfavorable to Canada for a number of years. The exports of Canadian produce, with portions exported to the British Empire and foreign countries for the fiscal years 1914, 1920, 1921, 1922, and 1923 were:

Fiscal Years	Total Exports	To British Empire	To Foreign Countries
1914	\$431,588,439	\$238,642,517	\$192,945,922
1920	1,239,492,098	561,791,887	677,700,211
1921	1,189,163,701	403,452,219	785,711,482
1922	740,240,680	345,835,410	394,405,270
1923	931,451,443	439,625,892	491,825,551

Canada vastly improved her position among the principal exporting countries of the world after 1913. In 1913, Canada occupied tenth place as an exporting country, but by 1922 she had advanced to fifth place, being surpassed by the United States, the United Kingdom, France, and Germany. With respect to the principal importing countries, Canada in 1922 occupied exactly the same position as in 1913, viz., eighth place.

Railways. As Canada is nearly 4000 miles wide, railway transportation is a problem of vital economic importance. In 1922, there were

CANADIAN IMPORTS AND EXPORTS (Figures in thousands)

Articles	Quantity	Value *	Quantity	Value *
Imports				
Coal	ton	18,140	14,323	\$72,114

* Canadian dollars; conversions not made. During 1923 the Canadian dollar was 2 per cent below par on New York

39,773 miles of steam railways in operation, as compared with 29,304 miles in 1913. During 1922, 495 miles of new line were opened; 267 miles were completed but not opened for traffic, and 1115 miles were under construction. Of the 1922 mileage, 22,681 miles were owned by the government, as compared with 2734 miles in 1914. Much of the increase in government-owned railways was after 1915 when it became necessary for the government to take over and operate the National Transcontinental Railway. Thereafter the government acquired control of the Canadian Northern, Grand Trunk Pacific and the Grand Trunk proper, the first and third in 1918, and the second in 1919. The last step in the consolidation of the various railways under government operation and control was taken on Jan. 30, 1923, when the unification of the Grand Trunk and Canadian National Railways was provided for, and the act to incorporate the Canadian National Railways was brought into effect. In addition to the above roads, the Central Vermont Railway was a part of the Canadian National Railway System. Steam-railway statistics for 1922, with 1913 figures shown in parentheses, were: total train miles, 107,625,144 (113,437,208); passengers carried, 44,383,620 (46,185,968); freight, 108,530,518 tons

31, 1923, a total of 157,980 vessels (19,462 sea-going) of 72,200,372 tons register (17,095,883 sea-going) entered Canadian ports in the sea-going, coastwise, and rivers and lakes trades, as compared with 140,597 (18,320 sea-going) vessels of 72,667,084 tons register (14,982,393) for the fiscal year 1914. Clearances in 1923 totaled 156,045 vessels (19,593 sea-going) registered tonnage 71,172,889 (17,182,454 sea-going); in 1914, clearances numbered 135,542 vessels (17,695 sea-going), registered tonnage 66,707,541 tons (14,586,093 sea-going).

Public Finance. During the fiscal year ending Mar. 31, 1924, the total revenue of the Dominion was \$388,514,567; in 1923, it amounted to \$384,790,135, and in 1914 to \$163,174,395. Expenditures, including those chargeable to the consolidated fund and to the capital account, totaled \$314,327,555 for the fiscal year 1923-24, \$322,069,003 for 1922-23, and \$186,241,048 for 1913-14. The net public debt of Canada on Mar. 31, 1924, no credit being taken for non-active assets, was \$2,409,326,639; on Mar. 31, 1923, it was \$2,430,202,552; and on Mar. 31, 1914, it was \$335,996,850. Details of receipts and expenditures for the fiscal years 1913-14, 1922-23, and 1923-24 are shown in the accompanying table.

DETAILS OF CANADIAN RECEIPTS AND EXPENDITURES

Total	\$186,241,048	\$322,069,003	\$314,327,555

(106,992,710 tons); gross earnings, \$440,687,128 (\$256,702,703); operating expenses, \$393,927,406 (\$182,011,690); ratio of expenses to receipts, 89.39 per cent (70.90 per cent). Up to Dec. 31, 1922, the total value of government aid granted to steam railways in Canada, exclusive of the two government railways, Intercolonial Railways System, and the Prince Edward Island Railway, amounted to \$722,648,946. Of this sum \$662,843,886 represented aid granted by the Dominion government, \$43,414,386 that granted by the provincial governments, and \$16,390,674 that granted by municipalities. Similar statistics for 1914 were: financial aid granted by Dominion government, \$178,834,529; provincial, \$37,023,275; municipalities, \$17,914,836; total aid, \$233,772,640.

Shipping. For the fiscal year ended Mar.

The government's borrowing operations of 1923 were the most important since 1919, when the last Victory Loan campaign was launched. A \$200,000,000 bond issue was floated in the Canadian market for the purpose of retiring \$172,000,000 of the Victory Bonds due on Nov. 1, 1923. This was the first instance in Canada of a large national financial transaction being carried out on lines similar to the New York and London markets.

National Wealth. The national wealth of Canada for 1920 was estimated by the Dominion statistician at \$22,482,841,122. The major items were: farm values (land, buildings, implements and machinery, and live stock, Census 1921), \$6,592,351,789; forest (estimated value of accessible raw materials, pulpwood, and capital invested in woods operations), \$1,244,-

343,100; steam and electric railways (investment in road and equipment, \$2,868,000,000); urban real property, \$5,944,000,000; stocks of raw materials and manufactured goods, \$1,316,000,000, household furnishings, clothing, carriages, motors, etc., \$1,144,000,000. These estimates were based on 1920 when money values of commodities reached their peak. The natural income of Canada was placed at between \$4,500,000,000 and \$5,000,000,000.

Foreign Investments. The *Financial Post* of Toronto calculated that foreign investments in Canada were worth \$4,796,500,000, of which \$1,423,000,000 was in railways; \$1,162,000,000 in public securities; \$691,000,000 in industry; \$425,000,000 in forests; \$354,000,000 in mining; \$278,000,000 in public services; \$175,000,000 in land; \$150,000,000 in mortgages; \$127,000,000 in banking and insurance; and \$9,500,000 in fisheries. Foreign investments in 1913 were placed at \$2,416,723,870. Of the foreign investments in Canada, the United States held a total of \$2,500,000,000 and the United Kingdom \$2,000,000,000.

History. Canada's loyalty in the War was unquestioned. Old party strifes were dropped and the imperial bonds, which many had seen loosened under dominion government, tightened, as Canada hastened to proffer aid to the mother country. Parliament assembled on August 18, passed immediately eight war bills, and appropriated \$50,000,000 for war expenditures. Now the Canadians sighed for the warships which had been refused in 1913, fortunately Canada was able to purchase two powerful submarines, just completed for Chile, and to offer, with them, the Canadian cruisers *Niobe* and *Rainbow*. The call to the colors was met with generous response. In three weeks there were 32,000 men in the Canadian training camp at Valcartier, and almost 10,000 others were under arms; while 150,000 had volunteered their services and were waiting only to be called. It is significant that 2400 French-Canadians joined the first contingent. The First Canadian Division arrived in England Oct. 14, 1914, and reached the war area, Feb. 11, 1915. The Second Division reached France in the fall of 1915; the Third and Fourth in 1916; the Canadian Army Corps was formed late in 1915. Up to the passage of the draft act in August, 1917, 465,984 men had voluntarily enlisted. By the act in 1917-18, 83,355 more men were obtained. In all services, 595,441 Canadians were under arms during the period of the War. Total casualties were 211,000, divided as follows: killed in action, 51,670; died of disease, etc., 5000; wounded, 149,700; prisoners of war, 3730. The more important battles in which Canadians were engaged follow: The Canadian Army Corps, as part of the First British Army, saw service at the second battle of Ypres (1915), the battle of the Somme (1916), the taking of Vimy Ridge, Arleux, Fresnoy, and Hill 70 (1917), the battle of Amiens, Arras, and Cambrai (1918). Canadians, too, saw service in Russia, Macedonia, and Palestine. To the ships above mentioned, there were added in the Canadian fleet a mother-ship for the submarines, a mine-sweeping service, and a large number of motor launches. The personnel of the navy at the War's conclusion consisted of 749 men and officers. To these must be added the 4500 volunteers in the reserve who were engaged in patrol duty. There were other war activities in which Canadians partook.

About 13,000 men were in the Royal Air Force; there were Canadians on British ships, and in the medical, engineering, forestry, radiotelegraph services. Canadian shipyards were employed for the turning out of vessels and factories were converted into munition plants for the manufacture of shells, shrapnel, and powder. The problem of the repatriated soldier was met with foresight. In 1916, provision was made for the vocational training of disabled soldiers; in 1918, a department was created for the care of veterans and their restoration to peace-time activities. Perhaps the most important single measure was the Soldier Settlement Act whose purpose was to settle the men on the land. Aside from the 160 acres they were entitled to as civilians, men might make application for an additional homestead. Funds were to be appropriated from which loans might be made for the purchase of the land, improvements, and live stock.

Throughout the War, the Unionist party, with Sir Robert Borden as premier, was in control of the government. Sir Wilfred Laurier's opposition was consistently stormy. His patriotism, of course, was not to be questioned, and his appeals to the French Canadians for the support of the War increased in fervor as the years progressed, but some of his party were more than lukewarm in their attitudes. Racial animosities brought the language question once more to the fore in 1916 and only the outspoken condemnation of Borden defeated a measure in the Parliament for the support of French schools in Ontario. On the eve of the general elections of 1917, Sir Robert Borden, regardless of the opposition of the Liberals, introduced a measure for compulsory military service. The bill was hotly opposed, 55 voting against it on its second reading, July 8. The vote was still closer in the Senate, standing 54 for and 39 against on the final reading. Feeling among the French Canadians ran high. There were anti-draft riots in Montreal in July, and pro-war speakers were attacked and newspaper buildings stormed. The Winnipeg convention of the western members of the Liberal party, held early in August, while it subscribed to a whole-hearted prosecution of the War, rejected by an overwhelming majority the idea of compulsion. Opposition increased as the elections drew near. Toward the end of August a general strike was called in Montreal, and though it failed, on August 29 a mass meeting of 5000 people was held in the city and the police were stoned when they attempted to break up processions. In Quebec the French press of all parties urged that the enforcement of conscription be deferred until after the polling. On October 12, Sir Robert Borden attempted to strengthen his government by including five Liberals in his cabinet. Another step, political in character, was the passage, in the closing days of the parliamentary session, of a group of laws "purifying" the electorate. The ballot was given to the troops in the Canadian Expeditionary Forces and to the female relations of soldiers, while it was taken away from natives of enemy countries who had been in Canada less than fifteen years, as well as from the pacifistic Mennonites and Doukhobors. The elections were held on December 17. The returns indicated that the balance of power was to be in the hands of the Liberal Unionists (i.e. supporters of Sir Robert Borden), for the Unionists had gained only a total of 108 seats of the 235. The senti-

ment in Quebec was clearly mirrored in the fact that 62 out of the 65 parliamentary districts were won by anti-draft Liberals. The election did not succeed in allaying discontent, for in January, 1918, the Quebec Parliament debated a secession resolution, while in March and April serious rioting took place. In April, police administration in the city was taken over by the military with the result that street fighting accounted for the death of four civilians and the wounding of 45 others. The labor elements, too, pressed for a hearing and demanded of the government, early in 1918, either the nationalization of the railways, or their unification under a central war board. Objection was made to the use of compulsory farm labor and the employment of Chinese and coolie workers. At the behest of their representatives, the government created a bureau for labor research and employment.

The transition to peace conditions after the Armistice was not easy. On Apr. 9, 1919, a Royal commission representing capital and labor was appointed for a consideration of the cost of living and the further participation of labor in industry. Official gestures were unavailing. In spite of the hostility of the Trades and Labor Congress, the "One Big Union" movement took on impetus and gained many adherents, particularly in the west, but also in Toronto. How far radical ideas had gone at once became manifest when a general strike broke out in Winnipeg in June, 1919. A local dispute between the ironworkers and the foundry owners over the question of unionization at once attracted the attention of all workers with the result that every union in the city, including firemen, police, postal employees, telegraph and telephone operators' organizations, ordered the cessation of work. Winnipeg was cut off from contact with the rest of the world. The returned soldiers expressed their sympathy with the strikers' cause and refused to countenance the establishment of martial law. The result was that the control of the city passed completely into the hands of the workers, the government being under the direction of a local council. The affair blew over, without bloodshed, fortunately, so that the end of the year saw the old conditions restored. New leaders, too, appeared after the War. Sir Wilfred Laurier died Feb. 17, 1919, and in August Mr. William Mackenzie King was elected as his successor to head the Liberal party. In July, 1920, Sir Robert Borden resigned from the premiership and was succeeded by Mr. Arthur Meighen. Mr. Meighen's cabinet, however, was in power only to December, 1921, for in the elections of that month the Conservatives went down to a disastrous defeat. Besides the National Liberal and Conservative parties, and the Liberal party, the National Progressives or Farmer's party and the Laborites also had candidates in the field. The contest was a heated one, revolving about the question of a high tariff. Interest was added to the campaign by the fact that women were to vote for the first time. The result, in its decisiveness, was unexpected. The Premier and ten members of his cabinet lost their seats, while the Liberals succeeded in gaining not only all Quebec, but many seats in the Maritime Provinces, and in the West. In Quebec, Nova Scotia, Prince Edward Island, Manitoba, and Saskatchewan not one government supporter was elected. More sur-

prising was the success of the farmers. Their party elected 65 members to 51 for the Conservatives. The Liberals in all had 117 seats and the Laborites, 2. Mr. William Mackenzie King now became premier. Throughout 1922-24, Liberals and Progressives, the latter led first by Mr. T. A. Crerar and later by Mr. R. Forbe, worked for the most part in harmony. The more important measures on which there was a common sentiment were a low tariff with reciprocity between Canada and the United States, unified control of all government railways under a single board of management, encouragement of immigration for the benefit of the rural districts. The last question continued to engross almost the complete attention of the 1923 Parliament. The serious decline in the immigration from the United States (only 22,000 Americans had entered in 1922-23 as compared with 139,000 in 1913), and the none too rapid development of the western provinces, compelled the government to apply itself to the formulation of an elaborate programme. Measures were brought up for the expenditure of large sums in propaganda and the establishment of foreign agencies, for the attraction of immigrants from Great Britain and Scandinavian countries, and for the removal of restrictions on the late enemy countries. The government's farmer supporters were alienated by the inadequacy of these plans as they were, too, by the failure of the finance ministry to reduce the existing tariff schedules. These considerations, principally, led to the refusal on the part of the Progressives to join Mr. King's cabinet, with the result that only Liberals constituted the government. They succeeded, however, in remaining at the head of affairs into 1924, though through defeats in by-elections Mr. King was in a paper minority of four. Among the more prominent ministers were Sir Lomer Gouin, former premier of Quebec, and Mr. W. S. Fielding, one of the authors of the reciprocity agreement of 1911. (Both quit the cabinet early in 1924.)

A question of great local interest during and after the War was the enactment of prohibition laws. Most of the provinces moved toward this end by provincial legislation. But the need for a more stringent regulation became evident when it was ascertained with what ease liquor could be smuggled into and out of the individual provinces. The result was an increasing demand for Dominion regulation. In British Columbia and Quebec in 1920, requests were made for such general control while in Manitoba, Alberta, Saskatchewan, Ontario, and Nova Scotia, referenda revealed a similar sentiment. (See PROHIBITION.)

It is doubtful whether the War brought Canada and the Empire closer together. While Sir Robert Borden sat at the Imperial War Cabinet and Canadian representatives signed the peace treaties and received seats in the League of Nations Assembly, the independent temper was revealed in the demands made in 1920 for the right to amend the Canadian Constitution without application to the British Parliament as well as for the appointment of a Canadian minister to the United States with independent status. An interesting sidelight on the earnestness with which Canadians were increasingly pressing the point was shown in the negotiations of 1923 with the United States over the signing of a convention for the preservation of the halibut fisheries in the northern Pacific. The

United States, in reply to the query raised by Canada, expressed itself as willing to conclude such a convention "between the United States and Great Britain." To the surprise of the Americans, the Canadian government replied with some tartness that it desired the words "Dominion of Canada" substituted for "Great Britain" (January 16). This action precipitated a lively discussion in Canada, where, in many quarters, it was regarded as an abortive attempt on the part of the ministry to arrogate the treaty-making power. Upon the insistence of the American Senate, whose purpose it was to include within the meaning of the treaty all British nationals, the Canadian commissioner signed the convention late in 1923 "as the duly accredited representative of the King." Other striking expressions of the Canadian spirit of independence were the declaration, by a member of the Canadian cabinet in March, 1924, that decisions of the Imperial Conference were not to be considered binding unless approved by the Canadian Parliament, and the refusal of MacKenzie King to recommend to the Parliament, in June, 1924, the ratification of the Lausanne Treaty. This last, of course, was merely a gesture, for the signing of the treaty by the British government was binding on Canada as well. Another indication of the new sentiment was the request made in 1921 by the Canadian Parliament, as the result of a universal demand, that the Crown desist from conferring hereditary titles on Canadian citizens. In the same year, too, the Conservative Premier, Mr. Meighen, indicated how much closer the ties were between Canada and the United States than between Canada and the Empire, by opposing the renewal of the Anglo-Japanese treaty. Nor was progress made in the formation of a naval programme. In 1919, Lord Jellicoe visited Canada for the purpose of advising the country on a possible plan but the government announced the next year that the pre-war policy was not to be relinquished. Relations with the United States continued amicable, though the Conservatives in the elections of 1921 made much of the hardships imposed upon Canadians by the Fordney Emergency Tariff. In 1922, great interest was centred in the project, originating in the United States, for a St. Lawrence-Great Lakes Canal. In the same year negotiations were under way for the limitation of frontier armaments and for the formulation of a new treaty regulating the naval strength on the Great Lakes. As regards the latter, an agreement was reached for the replacement of naval vessels with revenue cutters.

Canadian governors-general during the period were the Duke of Connaught (1911-16), the Duke of Devonshire (1916-21), Lord Byng of Vimy (1921-). In 1919, the Prince of Wales made an extended tour of Canada and was very cordially received. See separate articles on the provinces; also BAFFIN LAND · EXPLORATION: POLAR RESEARCH; NAVIES OF THE WORLD.

CANALS. In the period 1914-1924 the construction of new canals or the canalization of rivers was vigorously discussed but comparatively little actual construction of really great projects was executed. During the War with the great demands for transportation and the lack of fuel or its high cost attempts were made both in Europe and the United States to use the canals to an unprecedented degree. At the same

time plans were proposed for further construction, and in the years following the War were under consideration. Those actually put under way were of comparatively limited significance. The New York State Barge Canal which had been completed about 1917, except for terminal facilities, was utilized far below its carrying capacity, and even during the War when it was commandeered by the United States Government and operated as a through waterway with special barges, it was run far below its possibilities.

The United States Government sought to take over the Cape Cod Canal, completed in 1914, by purchase in 1924, and this waterway became increasingly used. The United States also extended its canal system at Sault Ste. Marie, Michigan, on Sept. 18, 1918, and completed the fourth lock of the American Canal, which was named Sabin Lock in honor of L. C. Sabin, the general manager of the canal.

Chesapeake and Delaware Canal. The Chesapeake and Delaware Canal, about 15 miles in length, extending from Delaware City on the Delaware River to Chesapeake City, Maryland, on a stream flowing into Chesapeake Bay, was formerly taken over by the Government the event being officially celebrated at Delaware City on Oct. 11, 1919. This canal was chartered in 1799, but was acquired by the National Government under an appropriation of \$2,514,290 by Congress, and an additional item of \$500,000 for deepening and widening. The improvement involved making this waterway a sea-level canal which would require an increased excavation of 10 feet for a considerable distance at the summit level. This did away with the three locks constructed in 1850 with a width of 24 feet and a length of 220 feet which had served to restrict navigation. The summit level of these locks was 15 feet above mean low tide, while the mean ranges of tide at Delaware City and Chesapeake City were respectively six feet and two feet. The project adopted for the improvement provided for a lockless tide level canal 12 feet deep and 90 feet wide on the bottom, estimated to cost \$12,000,000. This canal when enlarged will form part of an inland waterway from Philadelphia to Norfolk.

Cape Cod Canal. The Cape Cod Canal which had been under construction for a number of years was formally opened on Aug. 1, 1914, and established direct connection between Buzzard's Bay on the South and Cape Cod Bay on the north, shortening the distance between Vineyard Sound and Boston by about 70 miles, and eliminating considerable danger due to hidden reefs and banks along the coast of the Cape, not to mention fogs which are often prevalent in this region. The canal is a sea-level canal without locks and practically a straight line with a single curve. It is lighted by electricity at night and is crossed by railway and highway bridges which give a width of 150 feet in the clear between the piers. For the greater part of its length the canal has a bottom width of 100 feet and a depth of 25 feet at mean low water. At three points the bottom width is increased to 250 feet so as to make passing points for vessels, while in the approach channels a width of 250 to 350 feet is maintained to deep water at both ends of the canal.

A massive breakwater, 3000 feet in length to the shore line, protects the entrance to the canal from being filled in by the action of the waves, in addition to forming a shallow harbor for ship-

ping. The excavation of the canal for the most part was done by hydraulic dredges. By 1915 the canal was made passable for large steamers and deep draft barges. After the War it was proposed that the United States Government should acquire the Cape Cod Canal, and in 1921 Secretaries Weeks, Denby and Hoover made an investigation and recommended that the Federal Government should acquire the control of the canal at a price of \$11,500,000, for which sum the Boston, Cape Cod and New York Canal Company was willing to sell.

Marseilles-Rhone Canal. A notable European canal project executed during the War period was the Marseilles-Rhone canal, involving an artificial waterway 51 miles in length and extending from the Rhone River at Arles to the Bay of Marseilles. This canal was also notable in that it included a tunnel four and a half miles in length which pierced the mountain ridge north of the city, and affords direct access to the harbor. A typical section of this tunnel is square invert 59 feet wide and 15 feet deep with an approximately semicircular arch of 41 feet radius, affording an excavated section 79 feet wide and 50 feet high. (See TUNNELS.) In addition to the tunnel there was involved a breakwater construction between Marseilles and Port de Bone, and in the Etang de Berre. At Arles where the canal had access to the Rhone a system of locks was built.

German Internal Waterways. In Continental Europe the various systems of canals which had been rather highly developed found advantageous use during the War. A notable instance was the river Main which was rendered navigable for vessels up to 1200 tons, and was employed as an internal route for general commerce and war supplies, particularly timber. The canalization of this river involved the construction of dams provided with ship sluices, so that it was possible to navigate with larger vessels than previously. A notable dam of this type was built at Mainkur which included a roller weir, a power plant and a raft chute 300 meters long and 12 meters wide, together with two side openings, each 30.6 meters wide, and a ship passage 40 meters wide.

The power plants at this dam were put in operation in 1921, but the sluices were completed and ready for use in 1917. The canalization of the Main was to extend from Frankfurt to Werenfeld, and it was proposed to add open canal construction between Werenfeld and Schweinfurt, while from Schweinfurt to Bamberg it would be possible to canalize the river.

There was also set on foot an important waterway involving the canalization of the Neckar through Baden and Württemberg from Mannheim to Plochingen, using the river bed for large vessel traffic. The plan involved also special canalization from Plochingen to Ulm and from Ulm to Ravensburg and Fredrickshafen in order to supply the states of Baden and Württemberg with coal and other facilities. Such a canal system naturally involved a large number of locks, some of them of considerable height and the development of river basins.

The first portion of this work was to develop the canal along the river with a length of 212 kilometers between Mannheim and Plochingen. This involved the construction of 26 sluices, all of which, with the single exception of that near Heilbroun, in existence before the War, required new construction. These sluices and dams per-

mitted a descent of a grade of 160 meters, and as they were movable they could be removed and replaced rapidly during the times of flood water or rapid increase in level. They were absolutely water-tight, so that all unnecessary loss of water was obviated, and power available for operating the movable dams as well as for other purposes could be developed. It required about five minutes' time to fill each sluice and the project in addition to providing navigation also aimed at the development of considerable electric power.

As a result of this development the Neckar would be made a navigable waterway for all seasons of the year, for barges of 1200 tons, completely loaded, and the traffic which before the War amounted to 400,000 tons per year would naturally reach much larger figures with the improved waterway, being estimated by some at as much, or in excess of 5,000,000 tons. The various power plants situated on the banks of the river between Mannheim and Plochingen before the War represented an output of 15,000 horse power, but with the completion of the works undertaken would develop some 63,000 horse power.

The beginning of these German canal works was made during the War but at the close of hostilities comparatively little was done for a while except to afford labor to the unemployed. Work was begun again on a large scale during the autumn of 1921, and towards the end of the following year some 81,000,000 cubic feet of excavation had been accomplished. The construction of the bridges and dams also was started, but in 1923 the increase of costs led to the slowing down of the project. The undertaking was of unusual significance both in a political and in an engineering sense as it involved the linking up of various German states according to the original plan of "Mitteleuropa," while the various locks, movable and other dams, sluices, etc., represented in many cases novel engineering departures. See PANAMA CANAL; SAULT STE. MARIE CANALS; SUEZ CANAL.

CANBY, HENRY SEIDEL (1878-). An American professor and editor (see VOL IV). In 1916, he became advisor in literary composition with professorial rank at Yale University. He resigned as assistant editor of the *Yale Review* in 1920, becoming editor of the *Literary Review* of the *New York Evening Post*. In 1918, he was on liaison work in England, Ireland and France for the British Ministry of Information. His works include: *College Sons and College Fathers* (1915); *Facts, Thought and Imagination* (in collaboration, 1917); *Good English* (in collaboration, 1918); *Education by Violence* (1919); *Our House* (1919); *Everyday Americans* (1920); *Saturday Papers: Essays on Literature from the Literary Review* (1921); and *Definitions: Essays in Contemporary Criticism* (1922). He is coeditor of: *Selections from John Masefield* (1917), *War Aims and Peace Ideals* (1919), *Anthony and Cleopatra* (1921), and editor of Stevenson's *Master of Ballantrae* (1922).

CANCER. Despite all organized effort to warn the public of the urgent need of early recognition and treatment of cancer, the mortality from the disease during the decade 1914-24 was apparently on the increase. The expression "apparently" is used because of the ease with which statistics can be assailed. There

was some evidence to show that cancer was not increasing, although none which shows any diminution. Granted that the death rate is a constant, improvements in diagnosis and increasing average duration of life, which result from modern sanitation, would still convey the illusion of an annual increase. If every death were followed by a skilled autopsy, the number of cancer deaths could be made to show an increase which would not be due to spread of the disease. The campaign of education conducted by the Association for Cancer Control cannot prevail against the innate fear of an examination, of the fear of an unfavorable diagnosis and of the fear of operation.

An increasing number of surgeons show pessimism, as in the statement by one that early operation can cure cancer although the diagnosis must be made at a stage in which successful diagnosis is seldom practicable. The favorable percentages obtained by surgeons of unusual attainments and experience operating under ideal conditions appear to show that early intervention can conquer the disease; but the average patient will be operated on by the local surgeon and under less favorable conditions. Some of these local men frankly admit that they have never cured a patient radically and some of them have finally refused to do operations. This statement may also be made concerning surgeons of more than local reputation.

What has been said of the knife applies with the same force to radium and Rontgen therapy. Under the most favorable auspices, individual operators obtain excellent results, but this does not benefit the average cancer victim. Hence many earnest workers are striving for a method of treatment which is applicable to the rank and file of cancer patients without the arbitrary selection of cases in which everything favors the patient.

CANDLE POWER. See **ELECTRIC LIGHTING**.

CANFIELD, DOROTHY. See **FISHER, DOROTHY CANFIELD**.

CANNAN, GILBERT (1884-). An English novelist and dramatist. He was educated at Cambridge, and became a dramatic critic on *The Star* in 1909-10. Among his books are: *The Anatomy of Society* (1919), *Time and Eternity* (1920), *Pigs and Peacocks* (1921), *Old Maid's Love* (1922), and the play, *The Release of the Soul* (1920).

CANNING. See **BOTULISM**.

CANNON. See **ARTILLERY, ORDNANCE**.

CANNON, JAMES, JR. (1864-). An American bishop, born at Salisbury, Md., and educated at Randolph-Macon College, Princeton University and Princeton Theological Seminary. Having been ordained to the ministry of the Methodist Episcopal Church, South, in 1888 he was named to different pastorates in Virginia. From 1894 to 1911, he was principal of the Blackstone Female Institute, and from 1914 to 1918, principal of the Blackstone College for Girls. In 1918, he became a bishop of the Methodist Episcopal Church, South. He was connected with numerous commissions and boards in connection with church, war and prohibition questions.

CANNON, JOSEPH GURNEY (1836-1926). An American lawyer and Congressman (see Vol. IV). He retired from Congress on Mar. 4, 1923, after serving for 46 years, during which he was

four times Speaker of the House of Representatives.

CANNON, WALTER BRADFORD (1871-). An American physiologist, born at Prairie du Chien, Wis., and educated at Harvard (A.B. 1896, M.D., 1900). In 1906 he was made Higinson Professor of Physiology. His works include: *Laboratory Course in Physiology* (1911), *Bodily Changes in Pain, Hunger, Fear*, etc. (published 1915, a valuable contribution to the literature of physiology); *Traumatic Shock* (1923). He was one of the editors of the periodical *Psychobiology* (1919-20). He has made many contributions to physiological periodical literature and is one of the most vigorous defenders of the value of animal experimentation.

CANTIGNY. See **WAR IN EUROPE, Western Front**.

CANTWELL, JOHN JOSEPH (1874-). An American bishop, born in Limerick, Ireland, and educated at the colleges of the Sacred Heart and Saint Patrick, Ireland. He was ordained to the Roman Catholic priesthood in 1899, and from that date until 1904 was curate in Berkeley, Cal. For the following 10 years he was secretary to the Archbishop of San Francisco, and from 1914 to 1917, vicar-general of the same diocese. He was made Bishop of Monterey and Los Angeles in 1917.

See **SOUTH AFRICA, UNION OF**.

CAPEK, JOSEF (?-). Czech artist and writer. He is joint author with his brother of the play *The World We Live In*, which was one of the outstanding plays of the 1922-23 season in New York. This play, often called "The Insect Drama," because all the characters except one are insects, is an arraignment of all phases of human life, and human characteristics represented by these insects are mercilessly satirized. See **CAPEK, KAREL**.

CAPEK, KAREL (1890-). A Czech journalist and playwright. He studied psychology at Prague, Berlin, and Paris, and made his debut in the theatrical world in Prague. He was art director of the national theatre, the Golden Temple, in Prague, but he soon established his own theatre, the Vinohradsky. He produced the dramas of Shakespeare, Byron, Molière, Ibsen, Strindberg, Goethe, Hauptmann and many Czech authors. His first attempt in writing drama was *The Robber*, a lyric comedy of love. This was followed by *R. U. R.*, a satiric melodrama which was played with great success by the Theatre Guild in New York City during the 1922-23 season. He was also joint author with his brother, Josef (q.v.) of the play, *The World We Live In*, played in New York City in 1922-23.

CAPEN, EDWARD WARREN (1870-). An American sociologist (see Vol. IV). He was again Thompson Lecturer on Missions at the Hartford Theological Seminary in 1914, 1917, 1918. He identified himself with the Kennedy School of Missions as secretary, instructor in sociology, and associate professor (1914 to 1917), becoming in 1917 full professor, and in 1919, dean. He was appointed Assistant Recording Secretary of the American Board of Commissioners for Foreign Missions in 1915. In 1919-20, he was chairman of the training school section of the Religious Education Association, and from 1920 to 1922, chairman of the Association of Institutions Engaged in

Missionary Training. He edited *Preparation for Missionary Work in Japan* (1915), and *Preparation for Presenting Christianity to the Hindus* (1917).

CAPERS, WILLIAM THEODOTUS (1867-). An American bishop, born at Greenville, S. C., and educated at South Carolina College, Furman University and the Theological Seminary of Virginia. Having been ordained to the ministry of the Protestant Episcopal Church, he was rector in churches in North and South Carolina and in Mississippi from 1895 to 1905. From the latter date until 1912 he was dean of Christ Church Cathedral, Lexington, Ky. From 1913 to 1916, he was bishop coadjutor in the diocese of West Texas, at which time he was made bishop of that diocese.

CAPITAL SHIP. See **VESSEL, NAVAL.**

CAPPON, JAMES (1854-). Professor Emeritus of English, and dean of the Arts Faculty at Queen's University, Canada (see VOL. IV). He is the author of various pamphlets, especially a series on the War: *What the Present War Means, German Politics and British Politics, Democracy and Monarchy in the Modern State, The Scandinavian Nations and the War, Bourgeois and Bolshevik*, etc.

CAPORETTO. See **WAR IN EUROPE, Italian Front.**

CAPPS, CHARLES R. (1871-) An American railway official, born in Norfolk, Va. He was educated at Roanoke College and began his railway career with the Seaboard and Roanoke Railway. He acted in important capacities with several railroads in the South, and in 1915 was appointed first vice-president of the Seaboard Air Line. He was president of the Marion Southern Railway and was director and vice-president of many other roads in the South.

CAPPS, EDWARD (1866-) (See VOL. IV.) An American philologist. He has been professor of Greek language and literature at the universities of Chicago and Princeton and lecturer at Johns Hopkins (1917). He was American Red Cross Commissioner to Greece, 1918-19, and Envoy Extraordinary and Minister Plenipotentiary, 1920-21.

CAPPS, WASHINGTON LEF (1864-). An American naval officer (see VOL. IV). He was president of the Navy Compensation Board and general manager of the Emergency Fleet Corporation in 1917. He was awarded the Navy Distinguished Service Medal for his work during the War.

CARCHEMISH. See **ARCHAEOLOGY.**

CARCO, FRANCIS (1886-). A French author, born at Nouméa, New Caledonia. He is a poet, belonging to the *Fantaisiste* school, a novelist, a dramatist, and art critic for *L'Homme libre* and *Gil Blas*. During the War he became aviation pilot at Etampes, after studying at the aviation school there. His works are picturesque, painting as they do Montmartre and being written in the *argot* of Paris. He has been called the "romancier des apaches". He is the author of: *Instincts* (1911); *Jésus-la-Caille* (novel, 1914); *Les Innocents* (1917); *Au coin*

des rues (tales, 1918, 1922); *Les Malheurs de Fernande* (sequel to *Jésus-la-Caille* 1918); *Les Mystères de la Murgue ou les Fiancées du IV^e arrondissement. Roman gai* (1918); *L'Equipe* (1919); *La Poésie* (1919); *Francis Carco, raconté par lui-même* (1921; in the collection *Ceux dont on parle*, directed by Marc Saunier); *Promenades pittoresques à Montmartre* (1922), and *Vérotchka l'Etrangère ou le Gout du malheur* (1923). The last-named novel was sharply criticized by the French reviews. The author seems out of his element here. His works also include: *Petits airs* (poems), and *Maman Pettidoigt*.

CARIBBEAN POLICY. See **UNITED STATES, History.**

CARINTHIA. A province of the Republic of Austria. Its area in 1910 was 3987 square miles; in 1923, 3688 square miles. Its population in 1910 was 396,200; in 1923, 370,432. See **AUSTRIAN REPUBLIC.**

CARLETON COLLEGE. An institution at Northfield, Minn., founded in 1866; under the auspices of the Congregational, Baptist and Protestant Episcopal churches. The number of students increased from 395 in 1913, of whom 37 were in the School of Music, to 880 in 1923, of whom 48 were music students. The ratio of teachers to students rose during the same time from approximately 1 to 15 to 1 to 12. Departments of art, biography, home economics and Spanish, were organized, and the number of individual courses increased from 200 to 340. The library increased from 25,000 to 70,000 volumes, and from 100 periodicals to over 600. The endowment rose from \$659,247 in 1913 to \$1,828,900 in 1923, and the annual expenditures from \$66,990 to \$338,395. The following buildings were constructed: Music Building (\$53,000), Skinner Memorial Chapel (\$145,000), Leighton Hall of Chemistry (\$315,000), four dormitories for men at a total cost of \$377,300, and six dormitories for women at a cost of \$205,700. The value of the college plant was increased from \$477,863 to about \$2,000,000. President, Donald John Cowling, D.D., LL.D., Ph.D.

CARLISLE, ALEXANDRA (MRS. J. COYNE) (1886-). An actress born in London, England, but well known in the United States from her appearances on the New York stage. Her first stage appearance was at Lowther Lodge, Kensington, in 1903 when she played Audrey in *As You Like It* with Patrick Kirwan. In 1908, she appeared at the Garrick in New York and from 1913 to 1920 played in America. Her best known characterizations in America include the name part in Masfield's *Nam* (Boston 1918, New York 1920) and Nancy Price in *The Country Cousin* (1917-19). She returned to London in 1921 as Marguerite in *Daniel* and also played Stella in *Three* (1921).

CARLSON, JOHN FABIAN (1875-). A landscape painter, born in Smaland, Sweden, who came to the United States in 1886. He studied art at the Art Students' League in New York and in Buffalo, and became head instructor of landscape painting at the Art Students' League School, Woodstock, N. Y. Carlson has been known particularly for his wonderfully toned and richly beautiful winter themes. His canvases are distinguished by the quality of light which invariably envelops and irradiates the scene, integrating all its rich colors in one full-toned harmony. In 1911, he was elected an

Associate of the National Academy, and in 1923 he received the Ranger fund purchase prize of the National Academy. He is well represented in the Corcoran Gallery, Washington, the Museums at Toledo, Ohio, Youngstown, Pa., and in other public collections.

CARLTON, NEWCOMB (1869-). An American engineer and business man, born at Elizabeth, N. J., and educated at Stevens Institute. From 1891 to 1919, he practiced as a mechanical engineer in Buffalo, N. Y., and was subsequently director of works of the Pan-American Exposition for three years. He was then connected with the Bell Telephone Company and the Westinghouse Electric & Manufacturing Company until 1910, when he became vice-president of the Western Union Telegraph Company. He was made president of this company in 1914.

CARMAN, WILLIAM BLISS (1861-). An American poet (see VOL. IV). His works published since 1913 include *Earth Deities* (with Mary Perry King, 1914); a translation of C. A. Debussy's *Album of Six Songs* (1915), *Open Letter* (1920); *Later Poems* (with an appreciation by R. H. Hathaway, 1921, (1922)).

CARNARVON, GEORGE EDWARD STANHOPE MOLYNEUX HERBERT, EARL OF (1866-1923). A British peer, and co-discoverer of the tomb of Tutankhamen in Egypt. He was born June 26, 1866, and was educated at Eton and Trinity College, Cambridge. His interest in Egyptology was aroused by the collections of illuminated books and manuscripts which he had gathered, and in 1906 he applied for permission to excavate at Thebes. As he had obtained the assistance of Howard Carter, former inspector in the service of antiquities at Thebes, the permission was granted and the two undertook a series of excavations mostly on the northern side of Assasif Valley near the Temple of Derel Bahri. In 1908, they discovered the tomb of a prince of the Eighteenth Dynasty, containing precious raskets and a gaming board. In succeeding years, tombs were systematically discovered and cleared. Meanwhile Lord Carnarvon, with his family, took up his residence in the Valley of the Kings and worked on an account of the excavation, which appeared in 1912 under the title of *Five Years' Exploration at Thebes*. After the War he received a concession in the Valley of the Kings, and with Mr. Carter undertook to excavate down to bedrock. In November, 1922, after long labors, they uncovered the wall which finally pointed to the tomb of Tutankhamen. On Apr. 5, 1923, as the result of an insect bite, Lord Carnarvon died at Cairo. See TUTANKHAMEN; ARCHÆOLOGY.

CARNEGIE CORPORATION OF NEW YORK. See LIBRARY ASSOCIATION, AMERICAN and LIBRARY PROGRESS.

CARNEGIE ENDOWMENT FOR INTERNATIONAL PEACE. See LIBRARY ASSOCIATION, AMERICAN.

CARNEGIE GEOPHYSICAL LABORATORY. See MINERALOGY.

CARNEGIE INSTITUTE OF TECHNOLOGY. A nonsectarian institution of technical education at Schenley Park, Pittsburgh, Pa., founded in 1900 by Andrew Carnegie. The student enrollment increased from 3285 in 1914 to 4282 in the year 1923-24, and 628 in the summer session of 1923; the faculty from 202 to 288 members. The productive funds in 1924

were \$8,000,000 and the income \$1,300,000. The \$400,000 gymnasium was completed in 1924. There were four colleges: College of Engineering, College of Industries, College of Fine Arts, and the Margaret Morrison College for Women. Evening classes were held in the Colleges of Engineering, Industries, and Fine Arts. President, Thomas Stockham Baker, Ph.D.

CARNEGIE INSTITUTION OF WASHINGTON. An institution established in 1902 for the purpose of encouraging research and investigation, and the application of knowledge to the improvement of mankind. The 100-inch reflecting Hooker telescope of the Mt. Wilson Observatory was completed in 1916; in 1921 it was announced that important new discoveries had been made by Dr. A. A. Michelson that furnished a new starting point for further investigations concerning the nature of the universe. By use of the interferometer the dimensions of Betelgeuse in Orion and many other stars were measured, and the way was opened for corresponding observations on a group of stars theretofore seemingly entirely out of range. The large ruling machine, for many years under construction, was successfully operated in the preparation of diffraction gratings. A new edition of *Ptolemy's Almagest*, Hipparchus's great catalogue of stellar positions, was issued in 1916 as a result of the researches of Dr. C. H. F. Peters and Edward B. Knobel, and a new and probably final edition of the *Catalogue of the Stars* by Ulugh Beg, the Arabian astronomer of the 15th century, was published in the following year. The Mt. Wilson Observatory and the California Institute of Technology (q.v.) in 1922-1923 jointly conducted researches in the structure of matter.

The department of terrestrial magnetism was engaged throughout the decade in making a magnetic survey of the earth. Its investigations included the phenomena of magnetism, electricity and gravitation. The non-magnetic ship *Carnegie* made a number of voyages in the Atlantic, Pacific and Indian Oceans, and in 1916 sailed around the Antarctic icepack in 118 days. This sea survey, begun in 1909, in which the *Carnegie* traveled 300,000 miles, was completed in 1921, and the regions visited were charted. Land observations were continued by the Institution. The geophysical laboratory was engaged in a study of the atomic structure of minerals, especially of the minerals emanating from the interior of the earth, such as the lavas of the Hawaiian Islands and the fumaroles of the Katmai region of Alaska. (See GEOGRAPHIC SOCIETY, NATIONAL). Investigations were also conducted looking toward the solution of certain critical problems in earthquake study, and a representative was sent to Chile to study the problems arising from the earthquake of November, 1922.

As a direct result of archaeological investigations in Guatemala and Yucatan extending over the past decade, agreement was reached with the Mexican Government for a ten-year programme of investigation at the ancient Maya city of Chichen Itza in Yucatan. Along with the specifically archaeological investigations, the researches are to include a study of the physical characteristics of the Maya race and of the environment in which it developed. Through an advisory committee of eminent biologists a preliminary programme for studies on the physical

basis of human behavior was adopted in co-operation with the Department of Embryology and with other agencies. Ecological studies concerning environment relations of plants, which were undertaken at a number of stations in Colorado, Arizona, and other western States, led to a new interpretation of the development of vegetation. The department of genetics was established in 1920 at Cold Spring Harbor, L. I. with a section of experimental evolution, and a Eugenics record office. It carried on researches in variations in the elements of the cell recognized as bearers of characters transmitted to descendants. In 1921 a laboratory was built for the department of botanical research at Carmel, Calif., to be devoted to chemical and physical research with a view to obtaining additional information concerning the basis of plant activities. This department with laboratories at Tucson, Arizona and Carmel, California is now known as the laboratory for plant physiology.

Researches were also carried on in many other lines. In 1917 the eighth and last volume of Dr H. Oskar Sommer's edition of the Vulgate Version of the Arthurian Romances was published, concordances to Spencer, Keats, and Horace, and a new edition of *The Old Yellow Book* were issued. Dr Victor S. Clark wrote a *History of Manufactures in the United States (1607-1860)* and Dr. James Brown Scott edited eight volumes of *Classics of International Law*, a project which was assumed by the Carnegie Endowment for International Peace. The department of economics and sociology was discontinued in 1916. During the War two-thirds of the staff was devoted to work for the government.

Two hundred and twenty-five volumes were issued during the ten years between 1914 and 1924, and about \$13,000,000 was received by the Institution. A series of lectures on the recent researches, initiated in 1921, become an important personal means of interpreting to the scientific public some of the results of current investigations, and such work was supplemented by comprehensive exhibits in the Administration Building in Washington relative to current progress of work. See EXPLORATION.

CARNOTITE. See RADIUM

CAROLINE AND PELEW ISLANDS. See PACIFIC OCEAN ISLANDS

CARPENTER, EDWARD CHILDS (1871-). A dramatic author and novelist born at Philadelphia, Pa. His very well known plays include: *The Dragon-Fly* (with J. Luther Long); *Captain Courtesy*; *Remembrance*; *The Order of the Rose*; *The Barber of New Orleans*; *Bread upon the Waters*; *The Challenge*; *The Tongues of Men*; *The Cinderella Man* (1915); *The Pipes of Pan* (1917); *The Three Bears* (1917). *Bab* (1920); *Romeo and Jane* (1920); *The Girl and the Highways* (1920); and *Pot Luck*. Besides writing many novels, Mr. Carpenter edited the *Philadelphia Inquirer*.

CARPENTER, JOHN ALDEN (1876-). An American composer, born at Park Ridge, Ill., Feb. 28, 1876. Besides taking the regular courses at Harvard University, he at the same time completed the full course in music under Prof J. K. Paine. In 1906, he studied composition with E. Elgar in Rome and later (1908-12) pursued the same subject with B. Ziehn in Chicago. Although he never followed music as a profession, his compositions show a thorough

mastery of all technical means and at the same time pronounced impressionistic tendencies. His works comprise: *The Birthday of the Infanta*, a ballet-pantomime (Chicago, 1919); for orchestra, a symphony, *A Sermon in Stones* (Norfolk Fest., 1917); *Adventures in a Perambulator*, *Krazy Kat*, *A Pilgrim Vision* (Mayflower Tercentenary, 1920); a *Concertino* for piano and orchestra; a violin-sonata; a song-cycle *Gitanjali* and about 30 detached songs.

CARPENTIER, GEORGES (1894-). French heavyweight boxer, born at Lens, France. He has engaged in more than one hundred matches, his most important battles having been with Jack Dempsey (q.v.), world's heavyweight champion in 1921, Battling Siki in 1922 and Tom Gibbons and Gene Tunney in 1924. Carpentier was knocked out by Dempsey in the fourth round of a scheduled fifteen-round contest at Boyle's Thirty Acres in New Jersey, was knocked out by Siki at Paris, France, in the sixth round, lost on a decision to Gibbons at Michigan City, Ind., and was knocked out by Tunney at the Polo Grounds, New York City in the fifteenth round.

CARPETS. See TEXTILE MANUFACTURING, Wool.

CARR, GENE (1881-). American illustrator and caricaturist born in New York and educated at the public schools, who contributed to New York newspapers after 1894. He is best known for his creation of the comic series "Metropolitan Movies," "Reddy and Caruso," "Dooley," "Flirting Flora," the "Jones Boys," "Bill," "Stepbrothers," "Willie Wise," "Father," the "Prodigal Son," "All the Comforts of Home" and "Lady Bountiful."

CARR, HARVEY (1873-). An American experimental psychologist, born at Morris, Ill. He was educated at the universities of Colorado and Chicago. After receiving his doctorate, he was an instructor of psychology at Pratt Institute. In 1908, he joined the faculty of the University of Chicago, becoming assistant professor in 1916. His professional contributions include papers on comparative psychology, visual space perception, and educational theory.

CARR, HERBERT WILDON (1857-). An English philosophical writer. He was educated at Oxford, and in his adult life combined the vocation of banker with the writing of semi-popular works on philosophy. He received the honorary degree of D.Litt. (Durham) in 1912, and from 1916 to 1918 was president of the Aristotelian Society. In 1918, he became professor of philosophy at the University of London, Kings College, and editor of the *Proceedings* of the Aristotelian Society.

In his works, Professor Carr shows the influence of the philosophy of Bergson and of Croce, for both of whom he became a popular torch-bearer. His publications include: *The Problem of Truth* (1912); *Henri Bergson* (1912); *The Philosophy of Change* (1914); *The Philosophy of Benedetto Croce* (1918); *Bergson's Mind Energy* (Translation, 1920); *The Principle of Relativity* (1920); *Gentile's Theory of Mind as Pure Act* (Translation, 1921); and *A Theory of Monads* (1922).

CARREL, ALEXIS (1873-). An American biologist (see VOL. IV.) At the outbreak of the War, Dr. Carrel returned to France as a military surgeon and established a research laboratory in order to determine the most prac-

ticable antiseptics and technique for wound dressing. In collaboration with Dakin, he evolved the so-called Carrel-Dakin solution of sodium hyposulphite and this, with the technique devised, was used largely as a standardized method of wound care. In 1917, in collaboration (Carrel and Dehelly) was published the handbook *Le traitement des plaies infectées*, which appeared simultaneously in English. In collaboration with Professor Tuffier, Carrel also conducted researches on surgery of the orifices of the heart. In 1919, he returned to the Rockefeller Institute, New York City, to resume his original research into the growth and preservation of tissue outside the body and the implantation and grafting of tissues.

CARREL-DAKIN SOLUTION. See **CARREL, ALEXIS**.

CARRINGTON, FITZROY (1869-). An American editor (see Vol. IV). He resigned as editor of the *Print Collector's Quarterly* in 1917, but became American editor of the same periodical in 1921. He is the author of: *Engravers and Etchers* (Scammon Lectures, 1921).

CARROLL, EARL (?-). An American theatrical producer, and builder of a plastic and well appointed playhouse in New York City, the Earl Carroll Playhouse. One of his latest improvements in the theatre is a system of building raised platforms and steps by means of unit building-block construction whereby a long, wide flight of stairs can be built in a limited space, as well as platforms of any shape. The stairs are made in units of two steps each assembled on different sized blocks whose corners form intermediate steps. By means of this system scenes can be quickly and easily made up by four stage hands.

CARSON, EDWARD HENRY CARSON, BARON (1854-). British statesman and lawyer (see Vol. IV). When the War began he strongly urged Ulstermen to join the British army. He became attorney general in June, 1915, but resigned in October because he felt that the policy of Mr. Asquith's cabinet was to desert Serbia. In December, he joined Lloyd George's cabinet as First Lord of the Admiralty, in which position he endeavored to make good the losses suffered by the work of the German submarines. In July, 1916, he resigned from the Admiralty and accepted a place in the War cabinet without portfolio, but resigned this position in 1918. After the War he turned again to Irish affairs, and demanded the repeal of the Home Rule Act. He supported Lloyd George's proposal for the reform of the Government of Ireland by establishing parliaments in both Dublin and Belfast, and his efforts to make this plan a success were rewarded by the overwhelming majority in favor of it in the elections of May, 1921. Sir Edward Carson refused a seat in the new Parliament, and also declined to succeed Mr. Bonar Law as leader in the House of Commons. He quitted active politics in 1921, and accepted a life peerage as Baron Carson of Duncairn.

CARSON, HARRY ROBERT (1869-). An American Protestant Episcopal Bishop of Haiti, born at Norristown, Pa. He was educated at the University of the South. He studied theology, and was ordained as priest in 1896 by Bishop Sessums of Louisiana, in whose diocese he served as general missionary until 1898. During the Spanish-American War he was chap-

lain of the 2d Louisiana Infantry. After peace was declared in 1899, he held pastorates in Louisiana, and in 1910 was made Archdeacon of Louisiana. He was editor of *The Diocese of Louisiana*, the diocesan paper. He went to the Canal Zone as missionary in 1912, and founded the Holy Comforter Mission for lepers. At the General Convention of 1892 he was elected Missionary Bishop of Haiti, and was consecrated in the Cathedral of St. John the Divine, New York City, on Jan. 10, 1923.

CARSO PLATEAU. See **WAR IN EUROPE, Italian Front**.

CARTELLIERI, G. M. ALEXANDER (1867-). A German writer born at Odessa. He studied at the universities of Paris, Tubingen, Leipzig, Berlin, and was professor at Heidelberg and Jena. His principal works are: *Philip II Aug. König von Frankreich* (1899), *Regesten des Bischofs von Konstanz* (1894-5); *Philip II Aug. und der Zusammenbruch des angevinischen Reiches* (1913), *Die Schlacht von Bouvines im Rahmen der europäischen Politik* (1914); *Weimar und Jena* (1913); *Deutschland und Frankreich in Wandel der Jahrhunderte* (1914), *Frankreichs politische Beziehungen zu Deutschland von Frankfurter Frieden bis zum Ausbruch des Weltkriegs* (1918); *Gobineau* (1917); and *Grundzüge der Weltgeschichte 378-1914* (1919).

CARTER, HOWARD (1873-). An English archaeologist, born at Swaffham, Norfolk. He was trained as an artist, and began his work as an archaeologist in Egypt in 1891 under Professor Flinders Petrie, assisting in the excavation of Tel-el-Amarna in 1892. He was Government Inspector-in-Chief of Egyptian Antiquities in Upper Egypt from 1900 to 1905. He made many discoveries, and in 1917 began with Lord Carnarvon the work leading to the finding of the tomb of Tutankhamen in 1923, which disclosed objects of marvelous design and greatly increased the world's knowledge of ancient Egyptian art and life. He visited the United States in 1924, and gave a series of illustrated lectures in New York City on the finding of the tomb of Tutankhamen which were attended by very large and enthusiastic audiences. See **TUTANKHAMEN**; **ARCHAEOLOGY**; **CARNARVON, EARL OF**.

CARTER, WILLIAM HARDING (1851-). An American army officer, born at Nashville, Tenn. He was educated at the Kentucky Military Institute at Frankfort, and served in the Civil War. In 1913 he commanded the 2d Division of the United States Army, and of the Hawaiian Department in 1914-15, and retired in 1915. Upon being recalled to active service in 1917-18, he commanded the Central Department at Chicago. He wrote: *From Yorktown to Santiago with the Sixth Cavalry* (1900); *Old Army Sketches* (1906); *Giles Carter of Virginia* (1909); *The American Army* (1915); *Life and Services of Lieutenant Chaffee* (1917); *Horses, Saddles and Bridles*, 4th ed. (1918).

CARTHAGE COLLEGE. An institution at Carthage, Ill., founded in 1872. The student enrollment increased from approximately 80 in 1914 to 368 in 1923-24 and the endowment increased from \$250,000 to \$850,000. The teaching force was enlarged, until there were 35 members of the faculty in 1923-24. A domestic science department was added to the curriculum. President, Harvey D. Hoover, Ph.D.

CARTY, JOHN JOSEPH (1861-). An American electrical engineer, born at Cambridge,

Mass. He was educated in the Cambridge Latin School, and began his active work in telephony in 1879 with the Bell Telephone Company in Boston. In 1887, he was called to the charge of the cable department of the Western Electric Company in New York City and two years later became chief engineer of the New York Telephone Company. In 1908 he became chief engineer of the American Telephone and Telegraph Company and in 1919 vice-president of the company. As a pioneer in the development of the telephone he has invented many improvements, including telephone signaling apparatus, various switch-board and telephone exchange apparatus, as well as the telephone transmitter from secondary batteries. Among the important achievements accomplished under his direction were the underground telephone cable between Boston and Washington, transcontinental telephone lines, and telephoning without wires from Washington to Hawaii, and from Washington to Paris. During the War he was a member of the National Research Council and during 1918-19 he served in France with the rank of colonel. The Distinguished Service Medal of his own country and the Japanese orders of the Rising Sun and Sacred Treasure were conferred on him, and he was made an officer of the Legion of Honor. He received the Longstreth medal (1903) and the Franklin medal (1916) from the Franklin Institute, and the Edison medal (1918) of the American Institute of Electrical Engineers.

CARUSO, ENRICO (1873-1921). An Italian dramatic tenor (see VOL. IV). He died at Naples, August 2, 1921. During the last decade of his life his position as the greatest living dramatic tenor was unchallenged. His last appearance was as Eleazar in *La Juive* at the Metropolitan Opera House (Dec. 24, 1920).—Consult P. V. R. Key and B. Zirato, *Enrico Caruso* (Boston, 1923).

CARVER, THOMAS NIXON (1865-). An American economist (see VOL. IV). Among his later writings are: *Essays in Social Justice* (1915); *The Conservation of Human Resources* (1917); *Government Control of the Liquor Business in Great Britain and the United States* (1917); *War Thrift* (1919); *Principles of Political Economy* (1919); *Principles of National Economy* (1921).

CASE, SHIRLEY JACKSON (1872-). An American educator and theologian born at Hatfield Point, New Brunswick, Canada. He was educated at Acadia University (Nova Scotia), Yale and the University of Marburg. He instructed in mathematics and Greek, and, 1906-08, was professor of the history and philosophy of religion at Bates College, Me. In the latter year he went to the University of Chicago where he subsequently (1917) became professor of early church history and New Testament interpretations. He was editor of the *American Journal of Theology* (1912-20) and published: *The Historicity of Jesus* (1912); *The Evolution of Early Christianity* (1914); *The Millennial Hope* (1918); and *The Revelation of John* (1919).

CASELLA, ALFREDO (1883-). An Italian composer, one of the leaders of Futurism, born at Turin, July 25, 1883. He was taught by his mother until 1896, when he entered the Paris Conservatoire, studying under L. Diémer (piano, first prize, 1899) and G. Fauré (composition). He then made extensive tours of Europe as pianist and conductor. From 1912

to 1915 he was professor of advanced piano playing at the Conservatoire, and then accepted a similar position, as Sgambati's successor, at the Liceo Musicale di S. Cecilia in Rome. In 1921-22, he made a tour of the United States, where the public acclaimed him as an excellent interpreter of the classics, but declined his own futuristic works, which include *Le Couvent sur l'eau*, a choreographic comedy; two symphonies; *Italia*; *Prologue pour une tragédie*; *Notte di maggio* (with chorus); Suite in C; *Pagine di Guerra*; *Elegia eroica* for orchestra; chamber music and many songs. He published numerous articles making propaganda for Futurism and also a book, *The Evolution of Music* (London, 1924).

CASEMENT, SIR ROGER DAVIS (1864-1916). Irish revolutionist. From 1895 to 1913, he was in the British consular service, distinguishing himself for his efforts to suppress cruelty to the natives in the Congo Free State and in Brazil. In 1916, he aided in the Sinn Féin revolt. After passing some months in Germany, where he was believed to have engaged in a treasonable plot, he was captured in Ireland, Apr. 21, 1916, on landing from a German submarine, was convicted of high treason, June 29, and hanged on August 3.

CASE SCHOOL OF APPLIED SCIENCE. An engineering college in Cleveland, Ohio, founded in 1880. The student enrollment in 1923 was 538, approximately the same as in 1913, while the faculty was increased during the decade from 45 to 61 members, the library from 13,505 to 16,215 volumes, and the endowment from \$2,458,788 to \$3,008,439. The school received, by gift from Worcester R. Warner and Ambrose Swasey, a student observatory equipped with an object glass of 10 inches aperture, two astronomical transits of 3 and 4 inches aperture, a 4-inch zenith telescope, a 2-inch theodolite, and two Riefler clocks. Prof. Dayton C. Miller of the school devised a method of photographing sound waves, a thing never attempted before. Through this invention it is possible to make a complete analysis up to 30 different components of any musical sound, and thus tell exactly what tones and overtones any musical instrument gives out; and to compare any two musical sounds, as, for example, the notes of two pianos with each other, to determine which is the finer instrument. President, Charles Sumner Howe, Ph.D., LL.D.

CASSEL, GUSTAV (1866-). A Swedish economist and student of mathematics who studied at Stockholm and abroad. Early in his career he instructed in national economy at the high school in Stockholm, and about the same time published *Das Recht auf den vollen Arbeitsertrag* (1900), and *The Nature and Necessity of Interest* (1903). Many times in the period, 1905-21, he was identified with state financial matters in Sweden, and in 1921, he was one of the Swedish representatives who assembled in London for the meeting of the International Chamber of Commerce. He published *Theoretische Sozialökonomie* in 1919, and his *Memoirandum on the World's Monetary Problems* was published by the League of Nations for the International Financial Conference in Brussels in 1920. Cassel became a member of Svenska Vetenskapsakademien and a corresponding member of the Royal Economic Society.

CASSIRER, ERNST (1874-). A German philosopher of the neo-Kantian school. His

work has been made available in English through the translation of *Substanz und Funktion*, to which has been added in the same volume some chapters on Einstein's theory of relativity. His more recent works include *Freiheit und Form* (1918), *Henrich von Kleist und die Kantische Philosophie* (1917), and *Zur Einstein'schen Relativitätstheorie* (1921). The English translation of *Substanz* was published in 1923 under the title *Substance and Function and Einstein's Theory of Relativity*. Professor Cassirer edited a new edition of Kant's works in 11 volumes, and wrote the concluding biographical volume (1912-18).

CASTELLANI, ALDO (1875-). An Italo-British physician, authority on tropical medicine, born at Florence and educated at the University of Florence (M.D., 1899). His earlier years of practice were occupied in part by the study of tropical diseases, notably African sleeping sickness and yaws. In this research he represented in part a special commission from the Royal Society of England. For some time he was a professor of tropical medicine in the Ceylon Medical School. On the outbreak of the War he at once entered the service of his native country and was made a lieutenant-colonel of the Royal Italian Medical Service. He is best known by his exhaustive work, written in collaboration (Castellani and Chalmers), *A Manual of Tropical Medicine*. This was first published in 1910 but was greatly enlarged in subsequent editions, the fourth, which appeared in 1923, containing nearly 2500 pages.

CASTELNAU, EDOUARD DE CURIERES DE (1851-). A French general, born at Saint-Affrique. He served in the Franco-Prussian War, in Cochinchina and Algeria, and the outbreak of war in 1914 found him in command of the French 2d Army. He early distinguished himself as the "Savior of Nancy" with the result that in December, 1915, he was made chief of the general staff. In this capacity he went to Greece and helped plan the defenses of Saloniki. In 1916, he did yeoman work in holding Verdun against the German onslaughts. Once again he was sent on a mission, this time to Russia early in 1917, and on his return he was placed in command of the group of armies of the East. A remarkable soldier, it was said in his favor that only political enmities prevented his rise to the highest military post France had at her disposal.

CASTLE, EGERTON (1858-1920). An English novelist (see Vol. IV). His latest novels, written for the most part in collaboration with his wife, Agnes Castle, include: *The Ways of Miss Barbara* (1914); *The Hope of the House* (1915); *The Black Office* (1917); *Wolf Lure* (1917); *Minniglen* (1918); *New Wine* (1919); *Little Hours in Great Days* (1919); *John Seneschal's Margaret* (1920).

CASTRO, MATILDE (1879-). An American educator born in Chicago. She was educated at the University of Chicago and taught philosophy as a member of the faculties of Mount Holyoke College, Vassar College, and Rockford College. In 1913, she was called to Bryn Mawr. She is the author of *The Respective Standpoints of Psychology and Logic* (1912).

CATALYSIS. See CHEMISTRY; and CHEMISTRY, PHYSICAL.

CATALYSTS, USE OF. See CHEMISTRY, ORGANIC.

CATERPILLAR TRACTOR. See FARM TRACTOR.

CATHER, WILLA SIBERT (1876-). An American author born at Winchester, Va. She was educated at the University of Nebraska, and shortly after her graduation went into journalistic work. In 1906-12, she was associate editor of *McClure's Magazine*. Miss Cather is a writer who deals simply and profoundly with the problems of life, presenting them in a direct style. Among her works are: *April Twilight* (1903), a book of verse; *The Troll Garden* (1905), which attracted considerable attention; *Alexander's Bridge* (1912); *The Bohemian Girl* (1912); *O Pioneers* (1913); *The Song of the Lark* (1915); *My Antonia* (1918); *Youth and the Bright Medusa* (1920; *One of Ours* (1922); and *The Lost Lady* (1923). *One of Ours* won the Pulitzer Prize as the best novel published in that year.

CATHOLIC CHURCH. See ROMAN CATHOLIC CHURCH.

CATHOLIC UNIVERSITY OF AMERICA. An institution of higher learning located at Washington, D. C., established in 1887 by the Hierarchy of the United States. It included the Schools of Theology, Canon Law, Law, Philosophy, Letters, and Sciences. The affiliated institutions were the Catholic Sisters College for the training of teachers; Trinity College for the higher education of Catholic young women; and the houses of study of 16 religious orders. The student body increased in numbers from 1394 in 1914 to 2021 in 1924, the faculty from 75 to 103, and the library from 89,000 to 200,000 volumes. There were 86 scholarships in 1914 and 102 in 1924. The number of degrees conferred in the period was 1757. The principal advance in the way of organization was the establishment (1923) of the School of Canon Law; in the way of equipment, the building of the Martin Maloney Chemical Laboratory. The laboratory was placed at the disposal of the government during the War. The university also organized a unit of the Students Army Training Corps; conducted a school for paymasters of the navy and a rehabilitation school for ex-service men; and administered the Knights of Columbus scholarships for ex-service men. A gymnasium was built with a floor space of 44,000 square feet, and a stadium was in process of construction in 1924. Periodical publications of the university were: *The Catholic Educational Review*; *The Catholic Historical Review*; *The Catholic Charities Review*; and the *Corpus Scriptorum Orientalium*. Rector of the University, Rt. Rev. Thomas J. Shahan, D.D.

CATT, CARRIE CHAPMAN (?-). An American suffrage leader (see Vol. IV). In 1920, she had the pleasure of seeing the work of a lifetime crowned with success when the women of America went to the presidential polls for the first time. In June, 1920, she was reëlected president of the International Woman Suffrage Alliance, and in 1923 she was made honorary president on her announcement that thereafter all her activities were to be devoted to the newly formed Pan-American Union. Her extensive travels during the years 1920-24, in Europe and South America, influenced greatly the progress of woman suffrage. In 1923, she was authority for the statement that Mussolini

was committed to the extension of the ballot to the Italian women

CATTELL, JAMES MCKEEN (1860-). Psychologist and educator (see VOL. IV). He was dismissed from Columbia University under war conditions (1917) but in the course of a legal battle with the university was able to recover the amount of his pension. In 1919, he published a volume attacking the administration of the Carnegie pensions for university professors. Retired from active teaching, he continued his educational work as editor of *The Scientific Monthly*, *School and Society* and *Science and Education*. He published his third edition of *American Men of Science* in 1921. He was elected president of the American Association on the Advancement of Science.

CAVE, GEORGE, VISCOUNT (1856-). An English jurist, born in London. He was educated at St. Johns College, Oxford, and began the practice of law in 1880. He filled many important posts and was standing counsel of Oxford University from 1913 to 1915. In 1914-15, he was attorney-general to the Prince of Wales. In 1915-16, he was solicitor-general, and from 1916 to 1919, Home Secretary. He was chairman of the South Rhodesia Commission, 1919-20, and in 1921 was chairman of the Munitions Inquiry Tribunal. From 1906 to 1918 he was a member of Parliament. He was created a viscount in 1918. He edited several legal treatises.

CAVELL, EDITH (1865-1915). A British nurse born at Swardston, Norfolk, England. She was educated in England and Belgium and in 1895 entered a London hospital as probationer. For several years she held various positions as superintendent and matron and in 1907 was appointed the first matron of the Berkendael medical institute at Brussels. In the War, the institute became a Red Cross hospital. According to the account of the affair sent by the American minister, Brand Whitlock, to London, and published by the British government, Miss Edith Cavell, an English woman who had been in charge of a training school in Brussels, was accused of utilizing her position as a nurse to assist in the escape of British, Belgian, and French soldiers from Belgium. She was arrested August 5; October 11, she was condemned to be executed by a firing squad of German soldiers. The carrying out of the execution was done in the deepest secrecy; the American minister learning of it on the evening of the 10th. Disliking to kill a woman in cold blood, the firing squad had aimed so inaccurately that Miss Cavell was not killed, but only wounded by a single bullet. Thereupon—and this was the circumstance that particularly infuriated the British press—the German officer in charge of the firing squad drew his revolver, put it up to the woman's ear, and pulled the trigger. In England, Miss Cavell was henceforth regarded as a martyr. A memorial service at Westminster Abbey, attended by Mr. Asquith as well as by representatives of the Royal Family, was thronged by a vast multitude anxious to do her honor. A statue, by Sir G. Frampton, was erected to her memory opposite the National Portrait Gallery, London.

CAWTHORN, JOSEPH (1869-). An

American actor born in New York City. He was educated at home by his mother and appeared on the stage as a child in Robinson's Music Hall, New York, in 1871, then with Haverly's Minstrels. He was taken to England at the age of nine, and was comedian in several musical plays. In 1910, he appeared as Oscar Spiel in *Girlies* at the New Amsterdam Theatre, New York. This was followed by his appearance as Louis von Schloppenhauer in *The Slum Princess* in 1911. He played in *Sybil* during 1916-17, in *Rambler Rose* in 1918, and as Timothy in *The Canary* during 1919-20. He also took the part of the Hon. Hudson Hobson in *The Half-Moon* in 1920.

CECIL, LORD (EDGAR ALGERNON) ROBERT (1864-). English statesman, third son of the Marquis of Salisbury. He was educated at Eton and University College, Oxford, and read for the bar. He devoted himself to the law until 1906, when he was elected to Parliament as a Conservative member. Like his younger brother, Lord Hugh, he became a staunch advocate of the Conservative doctrine, and while not so brilliant in debate, his sound sense and the frank honesty with which he held his position, earned him at once, too, a respectful attention. He fought against disestablishment, social legislation, and tariff reform, and it was the last that brought on his defeat in 1910. He was reelected in a by-election in 1912 and sat after that for the Hitchin division, Herts. During the War he displayed his great abilities in the difficult offices of Undersecretary for Foreign Affairs (1915-16) and Minister of Blockade (1916-18). In 1918, he was called upon to carry on the negotiations with the United States. His subsequent career took on something of the nature of a Crusade. He early became convinced of the necessity for some such instrumentality as the League of Nations to preserve international peace and together with General Smuts, among the British, threw himself wholeheartedly into the movement. With Smuts, he was British representative on the League of Nations' Commission, and it was as a result of Smuts's intercession that South Africa tendered him her seat in the League Assembly, when Lloyd George passed him over. He continued on the Assembly for South Africa into 1923. In April, 1923, he came to the United States in the interests of the League. His reception was cordial, Americans in particular being taken with his honesty and nobility, but it is unlikely that his plea carried much weight at the time. As the head of the League of Nations Union, he worked untiringly in the interest of universal peace to the neglect of his political career, in this instance resembling the conduct of the Frenchman Bourgeois and the American Clarke. In 1923, he entered the short-lived Baldwin Cabinet with the portfolio of Lord Privy Seal.

CECIL, LORD HUGH RICHARD HEATHCOTE (1869-). An English politician, fifth son of the Marquis of Salisbury. He received his education at Eton and University College, Oxford, and for a time was a Fellow of Hertford. He entered politics in 1895 as a Conservative and served in Parliament continuously to 1906. He was among the young Conservatives to take a stand against Chamberlain's tariff programme, and as such, gained an excellent reputation. He was defeated in 1906 and not returned

again until he was sent up by Oxford in 1910. Possibly too much of a scholar, and a political philosopher rather than a politician, his subsequent career was marked by a growing inactivity. He served in the War for a time; defended conscientious objectors in 1917; and in 1921 followed his brother, Lord Robert, (q.v.) in the break from Lloyd George. His book *Conservatism* was the best expression of the philosophical implications of the doctrine in his generation. Like the other Conservative, Disraeli, he finds the only sound position is a reversion to Burke.

CELESTIAL MECHANICS. See ASTRONOMY.

CELLULOSE. See CHEMISTRY, ORGANIC; EXPLOSIVES; SILK, ARTIFICIAL.

CEMENT. An important development of the decade 1914-24 was the larger use of concrete for many forms of construction of widely different types. This naturally led to an increased demand for cement, and with it came various improvements in the scientific proportioning of the constituents and control over the manufacturing processes so as to obtain a uniform and standard material of carefully specified characteristics. In the United States, Portland cement made up the bulk of the cement output. It is manufactured by calcining to incin-

throughout the country. The most important area of production is Eastern Pennsylvania, in the Lehigh district, where is found a valuable raw material known as cement rock. This region is not only the greatest producer but has the largest number of plants, and is followed in order of importance by California and a district comprising Illinois, Indiana, and Michigan. The general tendency in cement manufacturing was to install large plant units and to exercise greater care in the process of manufacture. Notwithstanding the increased production the number of plants in 1922 was 118 as compared with 133 in 1914 and 135 in 1909. More economical utilization of waste steam reduced production costs in many plants. The Portland cement industry grew steadily, as shown in the tables. It appears that consumption in 1923 was 121 barrels per capita, as compared with 77 barrel per capita in 1914. Cement was increasingly employed for general construction, particularly on account of its fire resisting qualities, and for the manufacture of durable highways. More cement was consumed than was produced in the United States in 1922. Consumption grew considerably during the War, except for 1918 and 1919, when it was checked by lack of construction.

Production and consumption rose again in

PRODUCTION
Principal hydraulic cements produced in the United States, 1918-1923

Year	Masonry (natural) cements		Portland cement		Total	
	Barrels	Value	Barrels	Value	Barrels	Value
1918	492,966	\$401,341	71,081,663	\$113,730,661	71,514,629	\$114,132,002
1919	528,589	583,554	80,777,935	138,130,269	81,306,524	138,713,825

* Domestic shipments plus imports minus exports

cient vitrification a mixture of limestone and clay marl, or blast furnace slag in the approximate proportions of one part of clay or shale to three of limestone. In the United States 125 plants were engaged in the production of cement in 1921, according to the census of manufactures for that year. The industry gave employment to only 30,891, for machinery is extensively used in the preparation, handling, and packing of the material. The consumption of fuel and power is unusually heavy, and the production of 114,789,984 barrels in 1922 required 8,500,000 tons of coal, 4,400,000 barrels of fuel oil, and 3,400,000,000 cubic feet of gas. In 1919 the industry employed 488,808 primary horse power and was exceeded by only 9 manufacturing industries in power demand.

The value of Portland cement produced in 1923 in the United States was \$257,684,424. About one-half of this value was added to the raw materials in the course of manufacture. The average factory price per barrel in 1923 was \$1.90. The cement industry is well distributed

1920, conditions were more stable, and the demand increased consistently with the greater demand for building. As illustrating the use and distribution of cement in 1922 in the United States the following tabulation of the consumption of Portland cement by use was made by engineers of the Portland Cement Association from statistics covering the year 1922:

	Barrels	Per cent
Public and commercial buildings	29,000,000	24.9
Dwellings	11,000,000	9.5
Sidewalks and private driveways	8,000,000	6.9
Miscellaneous farm uses	24,000,000	20.6
Concrete pipe for water, sewers, irrigations and culverts	5,000,000	4.3
Paving and highways	28,000,000	24.0
Railways	6,000,000	5.1
Bridges, river and harbor work, dams and water power projects, storage tanks, and reservoirs	3,500,000	3.0
Miscellaneous uses	2,000,000	1.7
Estimated consumption in 1922, in barrels	116,500,000	100

Cement manufacturing in Europe was naturally interfered with by the War but was gradually resumed as the reconstruction progressed. France in particular soon placed this industry on a prosperous basis and by 1922 had a production of some 4,633,150 tons. Not only was France using considerable amounts of cement in reconstruction work, but she also was able to restore the other countries. In Belgium the annual pre-war output of 1,500,000 barrels was gradually approached again as conditions returned to normality. In England the industry suffered considerably after the War on account of high coal and labor costs and the large amount of foreign imports. In Germany activity was restricted after the War, and the loss of coal fields and the consequent necessity of importing fuel restricted production, though in Westphalia pre-war conditions had been reached by 1922. Subsequent to the War was the establishment of a cement industry in China; Japan was already productive.

Besides Portland cement higher aluminium cements were developed in France and latterly in the United States. These cements, while they do not set more rapidly, show a greater strength after 24 hours than that of Portland cement after 28 days. A greater resistance to the chemical attacks of sea water and sulphate-bearing ground waters was also claimed for them. Aluminium cement was more costly, as high grade aluminium ore, such as bauxite, was largely required in the manufacture. The chemical composition of aluminium cement manufactured in the United States in 1924 was as follows:

Silica	magnesium, insoluble, loss, etc.	5	per cent
Aluminium (Al_2O_3)	...	40	" "
Lime (CaO)	...	40	" "
Iron oxides	...	15	" "

The method of using aluminium cement is much the same as that for Portland cement, except that wetter mixtures are used, and it must be used alone, not mixed with Portland cement. The cement, though not quick in setting, so that ample time must be afforded for mixing, setting, transporting and placing, nevertheless develops very rapidly, after setting, the high strength which is its principal advantage. During the War aluminium cement was used by the French Army in the construction of concrete foundations for big guns which were ready for operation within 24 hours. To offset its higher cost, aluminium cement possesses or was thought to possess many superior properties.

CENSUS. June 30, 1924, marked the close of a 10-year period during which were published returns of two decennial censuses covering the subjects of population, including the blind and the deaf; manufactures; forest products; mining; agriculture; mortgages on farms and homes; irrigation; and drainage. These two investigations were taken as of Apr. 15, 1910, and Jan. 1, 1920, respectively. Although the final reports for censuses of such scope are not usually available until the third or fourth year after the date of enumeration, statistics were given to the public piecemeal in press release and preliminary bulletin form almost daily, commencing within a few months from each date.

The decennial censuses although of great magnitude, involving the employment of approxi-

mately 100,000 clerks, supervisors, enumerators, and agents, are only a part of the many activities of the Bureau. The Bureau operates at full speed at all times. During the 10 years statistics were collected and published yearly concerning births and deaths; financial statistics of States and cities; marriage and divorce (decennially until 1922); and forest products, including the production of lumber, lath, shingles, wood pulp, and the consumption of pulpwood. Quinquennially the Bureau takes a census of electrical industries, including electric railways, telegraphs, telephones, and central electric light and power stations. Commencing with 1925, a census of agriculture was to be taken quinquennially also. Decennially, but not always during the three-year regular decennial census periods, the Bureau publishes life tables; information relating to institutional population, that is, prisoners and juvenile delinquents, insane in hospitals, feeble-minded and epileptics, paupers in almshouses; religious bodies; transportation by water; and wealth, debt, and taxation.

During the latter three years the Bureau issued a Monthly Survey of Current Business containing important current statistics on domestic, industrial, and commercial movements. The Bureau collected and published also, either semi-monthly, monthly, quarterly, or semi-annually, statistics of production, stocks, and consumption, covering various key commodities, such as cotton; hides, skins, and leather; boots and shoes; clothing; hosiery; wool consumption and stocks; tobacco; sugar; etc. For the use of various interested organizations, it made estimates from time to time, between the decennial announcements, of the population of States, counties, and cities, by color, sex, age, groups, and marital condition, for use during intercensal years. At two-year intervals the Bureau issued an Official Register or directory of persons in the service of the United States, exclusive of the army and navy. Commencing in 1921 and biennially thereafter the Fourteenth Census Act provided for a census of manufactures. Such a census had previously been taken at five-year intervals.

CENSUS OF AGRICULTURE. See AGRICULTURE.

CENTRAL AMERICAN UNION. In 1917, Salvador, as the Central American Court of Justice established by the treaty of 1907 drew near its end, called for a conference of Central American republics to renew the court and consider a scheme for lasting coöperation, but the conference was never held because of Nicaragua's refusal to coöperate. In 1920, Salvador once more issued her invitation. Representatives of the five countries met at San José, Costa Rica, and on Jan. 19, 1921, a treaty of union was ready which all but Nicaragua signed. The Costa Rican National Assembly refused to ratify the pact with the result that only three countries, Salvador, Honduras, and Guatemala, remained. The treaty of union contained the following provisions: establishment of a federal republic in which the constituent states were to have local autonomy; the creation of a federal council as executive, a bicameral house, and a judiciary system; a common army and a single federal code, budget, customs' tariff, monetary system, and communications' system. Free trade was to exist among the states; existing treaties with foreign powers

were to be observed; foreign loans made by the states were to have the approval first of the federal government, the states were to continue their individual debt services. The temporary federal council, representing the three states which had ratified the pact, began meeting on Oct 10, 1921, at Tegucigalpa, Honduras, and it thus seemed that Central American aspirations toward union would at last be satisfied, after more than 80 years of disunion. However, President Herrera of Guatemala, who had consistently championed the Union, was overthrown by a military coup on Dec. 5, 1921, and General Orellana, who succeeded to the presidency, announced that Guatemala had decided to withdraw from the federation. It meant the end of the Union and on Jan. 29, 1922, three days before the Union was to have become permanently effective, the provisional federal council declared the federation dissolved.

This failure of the countries concerned to come to an understanding among themselves led to an attempt on the part of the United States to effect an arrangement. On the proposal of the President of Nicaragua, who was known to be under the influence of the Washington government, a conference of the presidents and cabinets of Nicaragua, Honduras and Salvador, with the United States ministers to those republics, was held on board the United States cruiser *Tacoma*, in Fonseca Bay. The three states agreed to suppress revolutionary agreements directed against each other, to keep alien revolutionary leaders under surveillance and deport them if requested by the imperiled government, and to call a further conference for the discussion of additional measures of unification. Thus were renewed some of the features of the treaty which Central American states had made in 1907 under Secretary Root's guidance, and which had been practically demolished, or at any rate disregarded, by Nicaragua's refusal, with the support of Washington, to accept the decree of the Central American Court relative to the dispute over Fonseca Bay (see SALVADOR and NICARAGUA). When Guatemala and Costa Rica were invited to adhere to the *Tacoma* agreement, they declined, on the ground that they considered the treaty of 1907 still in force. Nevertheless, Secretary Hughes in October, 1922, called a conference of the five republics to meet in Washington for the purpose of reinforcing the 1907 pact, limiting armaments, and other matters. The sittings commenced on Dec. 4, 1922, and terminated on Feb. 7, 1923. Possibly the most important plan proposed—that of a Central American Union—was voted down by Guatemala, Nicaragua, and Costa Rica. Positive achievements were the signing of 14 conventions and one treaty which included: the treaty of peace and amity to supplement the treaty of 1907; a convention for the establishment of an international Central American tribunal on which 15 American citizens were to serve; a convention for the establishment of international commissions of inquiry; a convention for the limitation of armaments; a convention for the establishment of free trade (from which Costa Rica dissented). Each nation promised to limit its standing army, for five years, to 16,400 men, to prohibit the export of arms to other states, to acquire no warships, and not more than 10 war airplanes. Unfortunately the treaty contained no guarantees against war and by Central

Americans was hardly considered an adequate substitute for a federal union. After the conference Secretary Hughes announced it as his intention to negotiate a treaty with Costa Rica for the recognition of her rights in the disputed question of the use of the San Juan River in the Nicaraguan canal project. See NICARAGUA.

CENTRAL STATIONS. See ELECTRIC POWER STATIONS AND GENERATING APPARATUS; STEAM ENGINES AND TURBINES.

CENTRAL UNIVERSITY OF KENTUCKY. See CENTRE COLLEGE.

CENTRE COLLEGE. An institution at Danville, Ky., founded in 1819. The student enrollment increased from 107 in 1914 to 308 in 1923-24, the endowment increased from \$380,000 to \$917,000, and the total assets from \$801,241 to \$1,435,887. There were 18 professors on the faculty and 30,000 volumes in the library in 1923. In 1918, the name of the institution was changed from Central University of Kentucky, which it had been called since 1901, to its original name, Centre College. A stadium seating 8500 people was completed in September, 1923. President, R. Ames Montgomery, D.D., LL.D.

CÉSPEDES, CARLOS MANUEL DE (1871-). A Cuban diplomat, born in New York City, and educated in the United States and in Europe. In 1895, he became governor of the Province of Santiago de Cuba, and from that time on was active in the military and political affairs of Cuba. From 1902 to 1908, he sat in the House of Representatives. From 1909 until 1914, he represented Cuba in Italy, Greece and Argentina, successively. In 1914, he was named Envoy Extraordinary and Minister Plenipotentiary from Cuba to the United States.

CEYLON. An island and British crown colony situated in the Indian Ocean off the coast of Hindustan. In 1921, its resident population was 4,497,854, an increase of 9.6 per cent over the last decennial census. Of these, the Europeans totaled 8099 (8524 in 1911); Burghers 29,403 (26,673 in 1911); Singhalese 3,015,970; Tamils 1,119,099; "Moors" 284,848, others 26,440. The nonresident population, i.e. military, shipping, etc., was 6695. The principal towns had the following populations in 1921: Colombo, 244,000 (213,396 in 1911); Galle, 39,100 (40,187 in 1911); Jaffna, 42,400; Kandy, 32,000. Agriculture continued as the leading activity, 3,337,000 acres out of the total 16,213,000 acres being under cultivation in 1922. In 1922, the distribution was as follows: paddy, 850,400 acres; other grain, 56,000 acres; cacao, 29,500 acres; cinnamon, 26,000 acres; tea 413,000 acres; coconuts, 820,000 acres; rubber, 390,000 acres (215,000 in 1911). In 1922, export of tea totaled 171,808,000 pounds (186,594,000 pounds in 1911); the export of rubber, 37,779,000 pounds of which 25,690,000 pounds went to the United States. The commercial record showed a continual improvement, in 1922 the imports being worth Rupees (Rs.) 281,741,000 and the exports (including reexports) Rs 306,615,000 as against Rs. 181,999,991 and Rs 198,954,902 for 1912. Principal exports in 1922 were: copra, Rs 28,804,000; coconut oil, Rs 14,925,000, tea, Rs. 146,037,000 (Rs 84,900,300 in 1911); coconuts, Rs 21,984,000 (Rs. 38,086,242 in 1911 for total coconut products); rubber, Rs. 59,537,000 (Rs 36,427,290 in 1911). The principal imports included cotton goods, rice,

coal and coke, and sugar. In 1921, total tonnage entered and cleared was 13,329,000 tons (14,926,764 in 1911) of which 9,069,000 tons were British (9,571,150 in 1911). In the same year, 731 miles of railway were open which was an increase of about 100 miles over the 10 years. For 1920-21, the budget contained the charges: for revenue, Rs. 70,619,000; for expenditures, Rs. 91,768,000. In 1911, these had been Rs. 47,264,222 and Rs. 48,643,687. The public debt at the end of 1922 amounted to £12,800,000. By an Order in Council of August, 1920, certain changes in Ceylon's administrative machinery were effected. The size of the legislative council was increased, the unofficial members being placed in the majority; but there was no advance toward a scheme of more popular government for which a large section of the native population had long agitated.

CHAFFEE, ZECHARIAH, JR. (1885-). American law professor, born at Providence, R. I. He was educated at Brown University and the Harvard Law School and for a time engaged in the private practice of law. In 1916, he went to the Harvard Law School where he was made a professor in 1919. He was among the first to protest against the violation of the constitutional liberties of American citizens in the years following the War, being, in particular, a severe critic of the practices of the Department of Justice under A. Mitchell Palmer. In company with Dean Pound and Felix Frankfurter of the Harvard Law faculty, among others, he helped evolve a sociological point of view toward the law. He wrote: *Cases on Negotiable Instruments; Freedom of Speech.*

CHALIAPINE. French transliteration for SHALIAPIN (q.v.).

CHAMBERLAIN, CLARK WELLS (1870-). An American physicist, born at Litchfield, Ohio. He was graduated at Denison in 1894 and then studied as a fellow at Chicago, and at Columbia. In 1900-01, he was professor of physics and astronomy at Colby, then held the chair of physics at Denison (1901-08), and a similar chair at Vassar (1908-13). He was then called to the presidency of Denison. His original investigations have included studies on the radius of molecular attraction, achromatization of interference, and the relative motion of the earth and ether; he devised a compound interferometer, a diffractometer, and a spectroscope of high resolving power.

CHAMBERLAIN, GEORGE EARLE (1854-). An American senator (see VOL. V). He was reelected senator for the term of 1915-21, and became a member of the United States Shipping Board for the term 1921-25. He was the author of the Chamberlain Military Preparedness Bill of 1918.

CHAMBERLAIN, HOUSTON STEWART (1855-). A German writer (see VOL. V). Since 1914, his works include: *Lebenswege meines Denkens* (1919); *Mensch und Gott; Betrachtungen über Religion und Christentum* (1921).

CHAMBERLAIN, JOHN LOOMIS (1858-). An American army officer, born in New York. He was graduated at the United States Military Academy in 1880, entered the army as second lieutenant in the First Artillery, and continued in the military service until his retirement in 1921 as a major-general. He served in the Spanish-American War of 1898-99 as chief ordnance officer with the rank of

major of volunteers; in the campaign against the Sioux Indians in 1900-01; in the campaign against the Moros in the Philippines in 1903; and after his transfer to the Inspector-General's Department continued in that service until his appointment in 1921 as Inspector-General in which capacity he served during the War, inspecting the American Expeditionary Forces in France in 1918. For "exceptional meritorious service" he received the Distinguished Service Medal. General Chamberlain was a graduate of the Artillery School in 1890 and of the Army War College in 1913, and was military attaché to Austria in 1897-98.

CHAMBERLAIN, (JOSEPH) AUSTEN (1863-). A British statesman (see VOL. V), son of Joseph Chamberlain. In the Coalition government after the outbreak of the War, he was Secretary of State for India. Because of criticism of the lack of medical preparation for the advance on Bagdad, he resigned, although he knew nothing about the matter until too late for it to be remedied. He again took office in 1918 under Lloyd George as minister without portfolio, and later was appointed for the second time Chancellor of the Exchequer. The budget he introduced in 1919 reduced by one-sixth the duties on articles from the colonies, thus making the principle of Imperial Preference, which had been in his father's programme fifteen years before, a regular part of the British financial system. Later in the year he issued the Victory Loan. By increasing the excess profits duty to 60 per cent, and introducing a corporation tax, he was able to balance the budget in his second year and to make a large payment on the national debt. On account of commercial depression, this debt payment was criticized. When Mr. Bonar Law resigned the Unionist leadership on Mar. 17, 1921, Mr. Chamberlain was unanimously chosen leader of the party. He became leader of the House of Commons and was given the office of Lord Privy Seal, Sir Robert Horne succeeding him as Chancellor of the Exchequer.

CHAMBERLIN, THOMAS CROWDER (1843-). An American geologist (see VOL. V). From 1898 to 1914, he was president of the Chicago Academy of Sciences. His later books include *The Origin of the Earth*, 1916. He was for many years editor of the *Journal of Geology*.
CHAMBER MUSIC. See Music, *Chamber Music*

CHAMBERS, EDWARD (1859), an American railway official, born in Waukegan, Ill. He began his railway service with the Atchison, Topeka and Santa Fé Railroad in 1878. He served in many important capacities with that road. He was assistant freight traffic manager for the coast lines and vice-president of the road from 1905 to 1917, when he resigned to become director of transportation of the United States Food Administration and the United States Grain Corporation. He was director of the Division of Traffic for the Federal Railway Administration from 1918 to 1920, and was also a member of the War Industries Board. He was appointed vice-president in charge of traffic for the Atchison, Topeka and Santa Fé Railroad in 1920.

CHAMBERS, ERNEST JOHN (1862-). A Canadian journalist and author (see VOL. V). In 1914, he was appointed censor at military headquarters in Ottawa, and the following year became Chief Press Censor for Canada. In the

latter year he was also made a lieutenant-colonel in the Canadian Army.

CHAMBERS, ROBERT WILLIAM (1865-). An American author (see VOL. V). His later books include: *The Dark Star* (1915); *The Restless Sea* (1917); *In Secret* (1918); *The Crimson Tide* (1919); *Slayer of Souls* (1920); *Little Red Foot* (1921); *America* (1921). He was a member of the National Institute of Arts and Letters.

CHAMBERS, WILL GRANT (1867-). An American psychologist born in Westmoreland Co., Pa. He was educated at Lafayette, Clark, and Chicago Universities. After his graduation, he was professor of mathematics in the State normal schools of Pennsylvania and Minnesota. In 1909, he became professor of education at the University of Pittsburgh, and in 1910, dean of the School of Education at that institution. His professional contributions included papers on genetic psychology, the evolution of ideas, memory types, individual differences, and correlation of character traits.

CHANDLER, WILLIAM HENRY (1878-). An American pomologist, born at Butler, Mo. He was graduated from the University of Missouri in 1905 and took postgraduate courses in that institution. Until 1910, he was assistant horticulturist at the University of Missouri, instructor in 1910-11, and assistant professor from 1911 to 1913. In the latter year he became professor of pomology at Cornell University, and in 1920, vice-director of research. Professor Chandler wrote on plant tissues and temperament, fruit and fertilizers, pruning, etc.

CHANLER, AMÉLIE RIVES (See RIVES, AMÉLIE).

CHANNEL ISLANDS. See GREAT BRITAIN.

CHANNEL TUNNEL. See TUNNELS.

CHANTEPLEURE, GUY (MADAME EDGAR DUSSAP, née JEANNE VIOLET) (1875-). A French author, born in Paris. Three of her works have been crowned by the French Academy. She is the author of: *Ma Conscience en robe rose* (crowned by the Academy; published in 1895, and subsequently); *Le Château de la Vierge* (1900, and subsequently); *Francée d'Avril* (crowned by the Academy, 1900); *Mon Ami l'oiseau bleu* (1900); *Les Ruines en Fleurs* (1901, etc.); *Ames féminines* (1902); *Le Splendide blanc* (1903); *Le Théâtre de la Primevère* (1904); *L'Aventure d'Huguette* (1904); *Le Baiser au clair de lune* (1908); *La Folle histoire de Fridoline* (1908); *Malencontre* (1910); *La Passagère* (1911); *Le Hasard et l'Amour* (1911); and *La Ville assiégée. Janvier, octobre, 1912—mars, 1913* (crowned by the Academy, 1913).

CHAPLIN, CHARLES SPENCER (1889-). Leading comedian on the motion picture stage. He was born in London, England, and after varied experience in the theatre, made his début as a film performer in the United States in 1914, where he soon became the most familiar figure in screen productions. He starred in many pieces of his own creation, including *The Kid* (1920-21), which was highly popular with all classes. In 1921, he visited Europe, where he received a popular welcome almost without precedent. He established a motion-picture plant at Hollywood, Cal.

CHAPMAN, CHARLES EDWARD (1880-). An American historian, born at Franklin, N. H., and educated at Princeton University, Tufts College, Harvard University, and at the

Universities of California and Seville (Spain). He was admitted to the bar in 1906, and thereafter was connected with the United Railways Company, San Francisco, and with the Western Electric Company, until 1909, when he became a teacher of history, first in the Riverside (Cal.) High School and afterwards in the University of California. In 1919, he was made associate professor of history in the University of California. His works include: *The Founding of Spanish California* (1916); *A Californian in South America* (1917); *A History of Spain* (1918); *A Catalogue of Materials in the "Archivo general de Indias" for the History of the Pacific Coast and the American Southwest* (1919); and *A History of California; the Spanish Period* (1921).

CHAPMAN, CHARLES SHEPARD (1879-). An American artist born at Morristown, N. Y., who studied with Chase and W. Appleton Clark. He was elected Associate Member of the National Academy in 1919. Among his awards were the Saltus gold medal from the National Academy in 1917 and the Carnegie prize from the Academy in 1921. Chapman's work as a painter and illustrator has been on exhibition in various parts of the country and one of his best known canvases, "In the Deep Woods," is in the Metropolitan Museum, New York.

CHAPMAN, HERMAN HAUPT (1874-). An American forester, born at Cambridge, Mass. He graduated from the University of Minnesota in 1896 and took postgraduate courses at the Yale Forest School. From 1898 to 1903 he was superintendent of the United States Agricultural Experiment Station at Grand Rapids, Minn., and after a year in the United States Forest Service was, from 1906 to 1911, instructor and assistant professor at the Yale Forestry School. From the latter date he was Harriman professor of forest management at Yale. From 1913 to 1924, Professor Chapman was a member of the State Park and Forest Commission of Connecticut. He wrote *Forest Valuation* (1914), and *Forest Mensuration* (1921).

CHAPMAN, JOHN JAY (1862-). An American author (see VOL. V). He is the author of: *Homeric Scenes* (verse, 1914); *Memories and Milestones* (1915); *Deutschland über Alles* (1915); *Notes on Religion* (1915); *Greek Genius and Other Essays* (1915); *The Letters of Victor Chapman, with Memoirs* (1917); *Songs and Poems* (1919); *William Lloyd Garrison* (2d ed., revised and enlarged, 1921); and *Glance toward Shakespeare* (1922).

CHARCOT, JEAN MARTIN. See PSYCHOLOGY, ABNORMAL.

CHARDONNE, JACQUES (pseudonym of Boutelleau) (1834-). A French novelist. In his novel *L'Épithalame*, he tries to get away from the subjectivism, the "moi," of many of the psychological novels of the twentieth century, by describing the psychological reactions of a couple. His novel shows some influence of George Eliot's *Middlemarch* and of Tolstoi's *Anna Karenina*.

CHARITIES. During the decade under review (1914-24) was evidenced a decided change in the form, purpose, and organization of public relief. Up to the beginning of this period hundreds of societies, organizations, churches, etc., scattered throughout the various States and cities were doing their best to aid unfortunates. This resulted, in many cases, in confusion, duplication of effort, friction, and an

extremely high ratio between the cost of administration and the relief afforded. With the War came a concentration of effort in the distribution of charities. The various governments, national, State and local, adopted a paternalistic attitude in this field of endeavor just as that attitude was taken in such war enterprises as shipbuilding, munitions manufacturing, food control, daylight saving, fuel conservation, railway administration, etc. Bureaus were rapidly organized to carry on in a centralized and more efficient manner the work previously done by the many unrelated charitable organizations. The undoubted increase in efficiency, in results obtained, and in administration, caused the continuance and rapid growth of government aid after the war period ended. Generally speaking, it may be said that public relief was carried on by three distinct agencies, governmental and private organizations, and foundations. The first mentioned, as stated above, was becoming more and more important. For the various phases of organized public relief, in which the idea of 'charity' had been supplanted by a theory of community protection, see CHILD WELFARE, MOTHERS' PENSIONS, JUVENILE COURTS, PENOLOGY, WORKMEN'S COMPENSATION, SOCIAL INSURANCE, OLD AGE PENSIONS, MINIMUM WAGE, HOUSING, WOMEN IN INDUSTRY, etc. It should be mentioned that many cities throughout the United States added charities bureaus to their governmental agencies, which supervised and correlated all the relief work carried on in the community. Huge foundations, privately endowed or supported, such as the Rockefeller Foundation, the American Society for the Control of Cancer, and the National Tuberculosis Society, continued to perform an important work in the advancement of public welfare. The subject of charities in its broadest sense cannot be closed without a reference to the activities of private organizations, depending on public contributions for existence, such as the Salvation Army, Y. M. C. A., Y. W. C. A., Red Cross, Knights of Columbus (q.v.). Receiving a tremendous impetus during the War, they continued to function on a much larger scale in the post-war period than before 1914.

CHARLES, ROBERT HENRY (1855-). A British divine and author (see VOL V). In 1919, he was made Archdeacon. In the same year, he was Warburton Lecturer in Lincoln's Inn Chapel, and Schweich Lecturer in 1919-20. His more recent works include: *Religious Development Between the Old and New Testaments* (1914); *The Chronicle of John of Nikan, translated from the Ethiopic* (1916); *Sermons Preached in Westminster Abbey* (1917); *The Apocalypse, edited with Text, Translation, and Commentary* (2 vols, 1920); *The Teaching of the New Testament on Divorce* (1921); *Lectures on the Apocalypse* (Schweich Lectures, 1919, 1922).

CHARLES I, EMPEROR OF AUSTRIA AND KING OF HUNGARY (1887-1922). The last of the Habsburg rulers, successor of the Emperor Francis Joseph, was born Aug 17, 1887, the eldest son of the Archduke Otto. He was little known until after his marriage with Princess Zita of Parma, in 1911. It is said that his parents endeavored to keep him away from harmful court influences and therefore sent him first to one of the large Viennese boys' schools. His military life had been spent not in the

capital but in distant garrison towns of the empire until the War, in which nominally he commanded the army that invaded Rumania. On the death of the Emperor Francis Joseph on Nov. 21, 1916, Charles proclaimed himself supreme war lord, and he and his consort were crowned King and Queen of Hungary in Budapest, December 30. During the War, he addressed a letter to his brother-in-law, Prince Sixte of Bourbon-Parma, which was published in April, 1918, and caused a great sensation. In it he asked the Prince to inform the French president secretly that Charles would support by all means the just claims of France on Alsace-Lorraine. The letter also proposed the restoration of both Belgium and Serbia. Before its publication its purport had been made known to the Berlin authorities, who naturally took great offense, and Charles publicly disavowed it. Count Czernin asserted that the text had been falsified. Among the Allies generally it was believed to be genuine. After the political and military collapse of Austria-Hungary on Nov 11, 1918, Charles in a manifesto declared that he relinquished all part in the administration of Austria and recognized the decision of German Austria to form henceforth a separate state. Two days later he gave up the throne of Hungary. In March, 1919, he left Austria under British protection and took up his abode in Switzerland. The Austrian Parliament formally deposed him in April, 1919, and annulled all the sovereign rights and other prerogatives of the House of Habsburg in Austria. Charles made no attempt to regain the Austrian throne but was drawn into movements for the recovery of his Hungarian kingdom, where a strong Habsburg party remained. In March, 1921, he suddenly reappeared in Budapest; he was coldly received and he soon returned to Switzerland. Though carefully watched by the Swiss authorities, he succeeded in escaping by airplane in the autumn of 1921 for another adventure in Hungary. At this time the movement had arisen in the Burgenland owing to dissatisfaction over the transfer of that region to Austria. A fragmentary army gathered about him but again the attempt completely failed. These attempts made it evident that Switzerland was no longer a safe place for him and, with his wife, he was put on board a British warship on the Danube and taken to Madeira, where he arrived Nov 19, 1921. He died at Funchal on the island of Madeira, Apr 1, 1922.

CHARWOOD, GODFREY RATHBON BENSON, first BARON (1864-). An English historian, educated at Balliol College, Oxford. He was a member of Parliament from 1892 to 1895 and Mayor of Litchfield from 1909 to 1911. In 1916 he published a biography of Abraham Lincoln which was very favorably received in the United States and was considered an important addition to Lincoln literature. In 1923 he published an interpretative biography of Theodore Roosevelt.

CHARTERS FOR CITIES. See MUNICIPAL GOVERNMENT.

CHARTERS, WERRETT WALLACE (1875-). An American educator, born at Hartford, Ont., Canada. He graduated from McMaster University, Toronto, in 1898, and took postgraduate courses at Columbia University and at the University of Chicago. After teaching for several years in Canada, he joined the faculty of the State Normal School at Winona, Minn. From

1907 to 1917, he was professor of the theory of teaching at the University of Missouri, and was dean of the School of Education at that university from 1910 to 1917. He was professor of education at the University of Illinois from 1917 to 1919, and from the latter date was professor of education and director of the research bureau for retail training at the Carnegie Institute of Technology. From 1920, he was also research director at Stephens College. He was the author of *Methods of Teaching* (1910), *Teaching the Common Branches* (1913), and also contributed numerous bulletins and articles to educational journals. He edited many series of educational books.

CHATTERTON, EDWARD KEDLE (1878-). An English author and journalist (see VOL. V). He entered the Royal Naval Volunteer Reserve as Temporary Lieutenant in 1914, and was promoted to the rank of Acting Lieutenant-Commander in 1918. He was in the Auxiliary Patrol Service in command of various ships (1914-17), and was on the staff of the historical section of the Committee for Imperial Defense (1917-21). His works during the decade include: *The Old East Indiamen* (1914); *The Romance of Piracy* (1914); *Q-Ships and their Story* (1922); and *Fore and Aft Craft and their Story* (1922).

CHATTERTON, RUTH (1893-). An American actress born in New York City. She made her stage debut in Washington, D. C., in 1909, as Polly Trippett in *Merely Mary Ann*. She came to New York, in 1911 and three years later first played Judy Abbott in *Daddy Long Legs* a part which made her famous throughout the United States. Other of her well known characterizations include: Olivia Dangerfield in *Come Out of the Kitchen* (1916); Mrs. Calthorpe in *Perkins* (1918); Comtesse de Candale with Henry Miller in *A Marriage of Convenience*; Judith Baldwin in *Moonlight and Honey-suckle* (1919); Mary Rose in the play of that name (1920).

CHÂTEAU-THIERRY. See WAR IN EUROPE, *Western Front*.

CHAUTAUQUA INSTITUTION. An organization founded in 1874 at Chautauqua, N. Y., conducting an annual series of lectures and entertainments called the general assembly, a six weeks' summer school and home reading circle. A campaign in 1919-20 to clear the Institution of debt raised \$400,000. A golf clubhouse was built in 1921. By an arrangement made in 1923 the department of education of the summer school was carried on by New York University and credit given in the University to all students successfully completing the work. From 50,000 to 60,000 persons attended the general assembly each year throughout the decade 1914-24; about 3500 attended the summer school, which had 18 departments offering 225 courses, and 12,000 subscribed to the home reading courses. The jubilee year 1924 witnessed the construction and dedication of a new Hall of Missions, a new dormitory for the summer school students, and the A. M. Smith-Wilkes Memorial Lecture Hall.

CHEESE. See DAIRYING.

CHELMSFORD, FREDERIC JOHN NAPIER THESIGER, VISCOUNT (1868-). A British public official. He was educated at Oxford. He became a member of the London County Council, 1904-05. He was governor of Queensland from 1905 to 1909, and of New South Wales

from 1909 to 1913. In 1916, he was made Viceroy of India, retiring from that office in 1921. He was a Conservative in politics, and much surprise was felt when he was asked to take the place of First Lord of the Admiralty in Ramsay MacDonald's Labor cabinet early in 1924. He accepted the post, however, as he found himself in accord with the new premier's policies.

CHEMICAL AFFINITY. See CHEMISTRY, PHYSICAL.

CHEMICAL WARFARE. The active beginning of the use of toxic gas in the World War dated from Apr. 22, 1915, when chlorine was released by the Germans in an attack against the French and British lines in the northeastern portion of the upper Ypres salient (see WAR IN EUROPE). This was indeed a momentous step for the Germans, as it introduced into civilized warfare a new weapon which led to new tactics of offense and defense.

The importance of the use of toxic gas in modern warfare is shown by the fact that during the year 1918, from 20 to 30 per cent of all the American battle casualties were due to it, but there was the compensating feature that where armies were supplied with masks and other defensive equipment only about 3 or 4 per cent of the gas casualties were fatal as compared with 20 to 25 per cent for those wounded by high explosive shells, shrapnel, bullets, etc. By far the greater part of the gas casualties resulted from the gas projectiles fired by field artillery, which in the British Army reached the great total of 170,000. In fact it was estimated that 90 per cent of the total gas casualties could be thus accounted for, notwithstanding the heavy losses at the first attacks in 1915 among troops quite unprepared when cloud gas was released from cylinders. But trusting to air currents to carry the gas was not satisfactory, and it was charged into projectiles which could be fired from guns, howitzers or mortars.

The use of lethal shells began in 1916 and these projectiles charged with deadly gases were used in addition to the lachrymatory gases. The three main killing gases used in chemical warfare were phosgene, diposgene, and chlorine. Their use made improved masks or respirators essential, and it was a constant contest between developing new toxic gases and finding adequate protection against them.

Chlorine was the first gas to be used and after it had been allowed to escape from cylinders, it was found that in its liquid form it could be filled into shells, which, discharged from regular field pieces, would be detonated in the usual way by a fuse and booster charge and small bursting charge of high explosive. Chlorine is a greenish yellow gas of strong suffocating odor which commercially is used for bleaching and purification of water supplies. By cold and pressure it is liquefied for storage and transport. At Ypres the Germans permitted this gas to float out but they were insufficiently supplied with it, and also with means of protecting themselves so that they were afraid to advance through it.

Phosgene, a gas formed by the combination of chlorine and carbon monoxide in the presence of a catalyzer, is a colorless gas that liquefies at 8° C. It was one of the deadliest gases used during the war and was employed not merely to annoy or to compel the wearing of masks but to kill as many as possible. It was often used in

an attack as it did not persist long in the air or on the ground after the explosion of the shell, and as a result it would clear away by the time that the oncoming troops reached the place of gas concentration.

Chlorpicrin, a gas that is an active poison and in addition a lachrymator or tear producer, is made by the reaction between picric acid or calcium picrate and chlorine. It is a colorless liquid that boils at a temperature of approximately 112° C, and the gas while not so poisonous as some of the toxic gases nevertheless was quite efficient. This after chlorine was the first war gas to be made on a large scale in the United States.

Mustard Gas, *Dichlorethyl Sulphide*, was introduced by the Germans in July, 1917, at Ypres and immediately became a most effective agent in gas warfare. It also proved a boomerang for the Germans, as they never were able to improve their original facilities for manufacture which could not produce more than 6 tons per day at the end of the war. At that time France and England had improved methods and quantity production, while the United States had 10 times the German capacity at the time of the Armistice. This gas, it is interesting to note, was prepared by the Germans by the method originally described by Victor Meyer and later developed in Emil Fischer's laboratory. Mustard gas is a colorless, slightly oily liquid boiling at 220° C with some decomposition and freezing at 14° C or below, the former temperature applying to the pure liquid. Mustard Gas was not necessarily fatal except in sufficient amounts and it acted on the skin like a deep burn. It attacked the lungs, the eyes, the skin and even the intestines. It blistered the skin and produced nausea thus requiring the removal of the mask. It had a delayed action and often a man might be gassed even fatally before he was aware of it, and then he was beyond the reach of treatment. Ground soaked with mustard gas remains impregnated for days continually giving off the vapor.

Diphosgene, or Superpalite, Perchlormethyl formate, was extensively employed by the Germans as was *Diphenylchlorarsine*, their blue cross gas, which produced sneezing and a disagreeable temporary sickness. The latter gas was not considered by the Allies very efficient though made by the Germans in large amounts. *Diphenylcyanarsine* and *Ethyl Dichlorarsine* were also employed by the Germans.

Lachrymatory or tear gases were extensively used during the World War by both sides in order to annoy and cut down the efficiency of the enemy and most of all to compel him to keep masked continually. This form of gassing was cheaper than the use of poison gas and even a trace of tear gas in the air would blind a man temporarily. In fact a single tear gas shell could distribute its charge so widely as to require the wearing of masks over an area so wide that from 500 to 1000 phosgene shells would be needed for the same effect. The tear gas was irritating to the membranes of the eye, and so far as it alone was concerned goggles might suffice for protection, but the usual practice was to mix it with deadlier gases. Most tear gases had bromine as a base, the bromine being derived from subterranean brines, and the gas could be used alone, but such combinations as brombenzyl cyanide were made, the one speci-

fied being extensively produced in the United States.

In addition to the gases mentioned others were employed and new toxic materials were developed during the war by organic and physiological chemists. Much was accomplished that was never revealed, and had the war continued another year the annihilation of the Central Powers by the discharge from aircraft of deadly gases produced in the United States and elsewhere was predicted.

Gas Masks. Naturally the use of gas immediately resulted in defensive measures. After the first attack by the Germans in 1915, extemporized masks and impregnated fabric helmets were rapidly developed in England and hurried to the Continent consisting merely of gauze pads soaked with neutralizing chemicals. Then came masks or helmets of a box respirator type first introduced by the British in August, 1916, where absorbing and neutralizing chemicals purified the air before it was inhaled by the wearer. An essential element of these respirators was the charcoal which had to be prepared with great care. Gradually the British and the Americans developed double protection masks which were efficient under all conditions. There were also protective suits and gloves to resist mustard gas.

Tactical Use of Gas. By 1917 the extensive and effective use of gas led to the development of special tactics both for attack and defense. Shells filled with gas and appropriately painted or striped to indicate the charge were issued along with shrapnel and high explosive. The kind of gas selected was determined by the nature of the plan or the military objective, all carefully considered especially with regard to the target and terrain. For example, in case of an advance, a gas that would disperse readily would be employed, or it might be that lanes would be left for the troops going up to seize or contest an objective. It must be remembered that while an ordinary high explosive or shrapnel shell exerts its effect immediately after the burst, that of a chemical shell has just begun and may even persist in the case of some of the chemical charges for a week or ten days. Furthermore, a bomb-proof shelter, safe against flying fragments, is no protection against a chemical shell whose fumes can pass around corners or sink into the ground.

The artillery during the War made a distinction between "lethal" and "neutralizing" projectiles and fire and this was the basis of the marking of the shell. The lethal shell is used to produce casualties and was employed against occupied positions for surprise effect, the object being to concentrate the greatest possible number of shell on the target in the smallest time, which should not exceed two or three minutes, as in that time gas masks can be adjusted and no further casualties should develop. In attacks of this kind phosgene is employed. With neutralizing shell or those filled with chemicals which are persistent and vaporize slowly, a slow searching fire is maintained scattered over the area to be neutralized. In other words the aim is to develop an atmosphere intolerable for unprotected troops, so that the artillerist seeks to find lines of communication, camps, rest billets, trench systems, cross roads, battery positions, and in short any point where troops are likely to be concentrated. The aim is to make them wear respirators, thus cutting

down their efficiency in using field or machine guns, in construction or supply work or the bringing up of transport. See CHEMISTRY, ORGANIC; STRATEGY AND TACTICS.

CHEMISTRY. Chemistry by the year 1924 had become a very different science from what it was ten years previously. It was realized that matter and energy no longer could be considered indestructible entities but are interchangeable. All matter is now regarded as of electrical nature and the atoms as more or less complex systems of electrons attached to very asymmetric associations of proton or helium ion. The various atoms with the same number of planetary electrons constitute a group which we know as a chemical element. These elements show varying chemical characteristics as they lie near or far, in atomic number, from a noble gas. Chemical theory, instead of being limited to the explanation of salts, acids and bases, is now widened to include the nonpolar compounds of electropositive elements with electropositive elements and of electronegative elements with electronegative elements. These are recognized as approaching the more absolute nonpolar characteristics of the compounds of the central elements, carbon, silicon, etc. The theory and use of catalysts and solvents was greatly extended and the existence of the enormous number of addition compounds in chemical reactions was recognized. Chemistry, instead of being a simple science of simple atoms and molecules is now recognized as a very complex science of very complex atoms and molecules, in which fields of force and radiation phenomena play a decisive part.

Matter and Energy. The great exponents of natural science in the nineteenth century attempted to work out the sciences of chemistry and physics in two separate compartments, chemistry as the science of matter and its transformations, physics as the science of energy and its transformations. This division was epitomized in the two great conservation laws, that of the conservation of matter and that of the conservation of energy. It was the task of the decade 1914-24 to disprove this supposed conservation of separate entities, and to show that matter and energy are not separate but interchangeable, that energy can be converted into mass and mass into energy. It was estimated by Aston that energy liberated by the change of the hydrogen in a glass of water into helium with consequent loss of mass would be sufficient to supply energy enough to run all the steam engines now in existence for 100 years.

The Difference in Energy, in Matter and Free State. The essential characteristic of matter is its mass. This is usually determined by its weight, or the attraction of the earth for a given substance compared with its attraction for an arbitrary unit of mass. It was shown by Kaufmann that the mass of an electron is purely its electrical mass, on account of the inertia of its electrical field. The same was shown true of the mass of a positive ion, the helium ion, as far as measurements can at present go. As all matter is made up of positive nuclei and electrons, the mass of a substance can therefore be taken as solely the summation of the electrical inertias of the electrical fields of its electrons and positive nuclei.

Electrical Constitution of Matter. The nineteenth century had attempted to explain the material phenomena of the visible universe

by an application of the laws of classical mechanics, founded on the spatial geometry of Euclid. More and more, this proved unsatisfactory. Particularly in radiation phenomena and the domain of chemical reaction, the mechanistic explanation was extremely unsatisfactory. Hence it was the task of science in the decade 1914-24 to rewrite the explanation of natural phenomena in terms of electrical concepts instead of those of mechanistic concepts. The reason for this change of basic concept of material science was twofold. First, the older mechanistic theory was shown to be inadequate in many important aspects; secondly, the electrical theory accounted for all the phenomena for which the mechanistic theory held good and in many cases where it failed. Not that the electrical theory did not bring with it problems of its own, to elucidate these will be the problem of the rest of the twentieth century.

Atoms and Molecules. Chemistry was the first of the sciences to discuss its subject matter as discontinuous. For many years the only supporting evidence as to the existence of discontinuous molecules was the kinetic theory of gases. But this kinetic theory was unable to account for the rapid increase in reaction velocity with increase of temperature. Hence in the first decade of the twentieth century arose a wave of skepticism as to the atomic theory. Evidence as to the existence of discrete molecules in gases and of atoms in liquids and solids arose rapidly from a number of various sources, so that we can now count and measure with a high degree of accuracy the atoms in the simpler compounds. Laue, Bragg and others demonstrated how the light waves of very short wave length and quite high frequency (X-rays) can be used to show the position of atoms in the spatial structure of a crystal and in pure liquids. Their work proved that chemical compounds have a definite spatial arrangement of the atoms, so that chemical combinations are primarily spatial arrangements of electrical fields of force.

Two Types of Chemical Compounds. The work of the decade under review emphasized the marked contrast between two types of chemical compounds, the polar and the nonpolar compounds. The polar compounds are those in which atoms of markedly different electrical characteristics are present. Each of these compounds at some temperature is a conductor of electricity. The nonpolar compounds are those of atoms of no great electrical dissimilarity and show extremely high resistance to the passage of an electrical current.

The Periodic System. It was early realized that the various elements distinguished by the analytical chemist had groups of marked similarities and dissimilarities. This led to many attempts to place the known elements into a consistent table or system which would satisfactorily arrange and contrast these varying characteristics. This whole endeavor was summed up by the periodic system of Mendeleev, and his dictum that the properties of the elements are periodic functions of their atomic weights. But this periodicity is no simple function of the atomic weight, for successive elements of very nearly the same atomic weights, such as potassium 39.1, argon 39.88, calcium 40.07, show enormous differences chemically and physically, whereas other elements of quite different atomic weights, such as

praseodymium 140.9, and neodymium 144.3, are so nearly alike in all their chemical properties as to be of incredible difficulty in separation. Then again, in several instances, such as argon and potassium, nickel and cobalt, iodine and tellurium, the atomic weight arrangement is definitely wrong.

It began to be realized, therefore, that the position of the element in the periodic system is more important than its atomic weight. In 1913, Moseley, an English physicist, discovered that the various elements when struck by an electron with great velocity gave off two series of X-rays of high intensity. Each of these series has definite wave lengths such that certain whole numbers are inversely proportional to the square roots of these wave lengths. Assigning aluminium the number 12, the other elements all possess whole numbers corresponding to their position in the periodic table, with the weight anomalies connected. This number is therefore called the atomic number and is a more important property of elements than the atomic weight.

Isotopes. Prout, 100 years ago, attempted to account for the elements as polymers of hydrogen. But the irregularities in the atomic weights of a number of the elements seemed to disprove this theory. After it had been discovered that lead from two radioactive substances had a different atomic weight from that of ordinary lead, though it was of identical chemical and physical properties, Aston set to work to measure accurately the mass of individual atoms or ions. A number of charged atoms or ions moving at the same rate were subjected to magnetic and electrical fields, and then allowed to strike a photographic plate. If one element be taken as standard, say oxygen, the other charged atoms will strike the plate from short distances away in direct proportion to their masses. In this way it was discovered that the elements which support the Prout hypothesis, having atomic weights very nearly whole numbers, carbon, oxygen, nitrogen, all have atoms of only one atomic weight.

But the elements whose analytical atomic weights deviate markedly from a whole number are all mixtures of atoms of whole number atomic weights. The true atomic weights are therefore all whole numbers referred to proton as 1. Thus chlorine (35.46) is a mixture of three different chlorines of atomic weights 35, 37 and 39. These three chlorines have identical chemical properties and are therefore called isotopes, meaning "in the same place in the periodic system." Thus is confirmed what was indicated by Moseley, that the atomic weight of an element is a minor and variable factor in the chemical properties of an element, and that the atomic number is the true criterion of its properties.

Transformation of Elements. Aston's work showed that all atoms have atomic weights which are multiples of the weight of a proton or hydrogen ion. The conclusion to be drawn, that the elements are polymers of proton or hydrogen ion, was tested by Rutherford. He bombarded the elements with charged bodies moving at extremely high speeds, the alpha particles of radium C. The mass of the products of this impact can be measured by known methods. Rutherford has shown that the elements whose atomic weight is $(3+n \times 4)$ or $(2+n \times 4)$ all give hydrogen ions as products

of the disintegration of the atom. Hence it is definitely shown that some of the elements at least contain hydrogen ion in their positive nucleus. The others appear to contain an isotope of the helium ion with atomic weight of three.

Shape of the Positive Nucleus of the Atoms. From the ratio of the number of impacts which disrupt atoms to the number of alpha particles used, Rutherford showed that the positive nucleus must be a very thin disk, not a round sphere. The atoms are therefore quite asymmetrical, not at all the spherical, symmetrical, inert particles postulated in the kinetic theory. This extreme lack of symmetry in the atom probably accounts for many of the discrepancies between the kinetic theory and actual fact.

The Electronic Theory of the Atom. Two theories based on the above data have attracted great attention as possible explanations of the electronic structures of the atom. One was proposed by Bohr, a pupil of Rutherford, the other by the American chemists Lewis and Langmuir. In the Bohr theory the electrons are whirling about the positive nucleus, as the earth and the planets circle in ellipses about the sun. These electrons, contrary to classical mechanics, emit no energy in their elliptical orbits. But when the system absorbs or emits energy, it does so by an electron jumping at once to a new elliptical orbit, and in so doing emitting or absorbing a definite unit or quantum of energy.

In the Lewis-Langmuir theory, the electrons are taken as approximating some position away from the nucleus and not encircling it. They are held away from the nucleus by a repulsive force. These attending electrons, for some unknown reason, show a great tendency to assume a cubical character by borrowing or losing one or more electrons. The electrons can be received in two ways; first, by taking them wholly into the cubical system of the electronegative atom, so as to give the electronegative atom a negative charge; and correspondingly, by loss from an electropositive element to leave a cubical electronic structure with a positive charge. In this way the polar compounds originate by the union of the electropositive and electronegative ions thus formed. Secondly, two electrons can be shared by two atomic cubes, so that these pairs of electrons are integral parts of two atoms at the same time. In this way the nonpolar chemical compounds are formed.

Both of these theories of atomic structure have their successes and their failures in interpreting the complete phenomena of matter. The Bohr theory has worked almost entirely on the separate atoms of pure elements at high temperatures and has been a success mainly with the simpler elements, hydrogen and helium. The Lewis-Langmuir theory has been worked out mostly with chemical compounds at ordinary temperatures. It is probable that both theories are more or less correct in their own special fields. Angarde has called attention to the fact that electrons moving rapidly in extreme elliptical orbits around a nucleus at one focus will act in many ways as if they were stationary at the other focus of the ellipse.

Polar and Nonpolar Compounds. If the visible universe were made up of uncombined elements, it would be a very simple and easily analyzable order of natural phenomena. In-

stead, an almost infinitesimal part of the world consists of simple elements, the rest is made up of compounds, which, as was said, fall into two general types, the polar and the nonpolar compounds. The polar compounds are primarily those of elements lying near the noble gases but on opposite sides of these gases in the periodic system. The nonpolar compounds are primarily of the elements which, lying midway between the noble gases, are therefore neither highly electronegative nor highly electropositive. The most important of these central elements are carbon and silicon. Carbon compounds are the skeleton on which the chemistry of life is built. (See ORGANIC CHEMISTRY) Silicon complexes are the basis of geology and will be discussed under that heading. The chemistry of the other central elements, such as titanium, is too little known to warrant discussion. The compounds made up of elements of like electrical character as well as those of the central elements are also probably nonpolar in character.

The Compounds of Electropositive Elements with Electropositive Elements. These include the intermetallic compounds or the alloys. These compounds have been enormously developed for special purposes in the last ten years. The success of the automobile is mainly due to the increased efficiency and consequent cheapening of automobile parts by the use of special alloys. Magnesium alloys, lighter than wood, are used for pistons; aluminum-bronze alloys replace steel in countless ways with saving of weight and increase in strength. The aeroplane engine has increased its efficiency mainly by increasing the ratio of horse power to engine weight by the use of special alloys. See AERONAUTICS.

The War gave great impetus to the use of special alloys. The enormous production of war material would have been impossible without the use of high temperature steels, most of whose improved formulas have been developed in the last decade. Noncorroding alloys are the basis of the electrical heating apparatus industry.

The Compounds of Electropositive Elements with Electronegative Elements. These compounds form the main corpus of inorganic chemistry. They comprise the acids, the salts and the bases. The work of Laué, Bragg, and others during this decade has demonstrated the spatial configurations of these compounds when crystalline. The results in general confirm the postulates deduced from chemical reactions. Every solid crystal or fragment of a crystal is a single molecule made up of repetition of the type-molecule or crystal cell. The position of the atoms in many of the simpler compounds is now quite accurately known through X-ray measurements.

Many improvements in the preparation of this polar type of compound were worked out during the decade by the application of improved scientific methods, such as the phase rule, to industry. The utilization of steel mill slag for the production of high-grade cement is a characteristic example of the utilization of by-products, hitherto useless, for the preparation of a valuable new product. The use of thorium oxide on the filament of a radio tube is an instance of the utilization of the newly discovered properties of a well known compound.

Compounds of Electronegative Elements with Electronegative Elements. It is said

that the German authorities were unwilling to risk a major war until Haber had demonstrated that nitrogen oxide compounds could be successfully produced in large quantities within the confines of the German Empire, from the nitrogen of the air. This so-called fixation of nitrogen has proceeded along two lines, the formation of nitrogen oxide and the formation of ammonia. The enormous development of the water power of the Tennessee River at Muscle Shoals, Ala., was to be devoted largely to the production of nitrogen compounds for use as soil fertilizer for the American farmer. Twenty years ago Crookes uttered his warning that the world's food was being seriously threatened by the shortage of nitrogen compounds. Developments of the decade 1914-24 definitely removed forever this possibility of a nitrogen famine.

The rival cyanide process by which calcium carbide is allowed to absorb pure nitrogen held promise mainly in the development of cyanide products and similar compounds of carbon and nitrogen. It was developed largely in America, at Niagara Falls.

The oxidation of sulphur dioxide to sulphur trioxide by atmospheric oxygen in the presence of a platinum catalyst has been one of the triumphs of catalytic chemistry. During the last decade this process almost entirely superseded the old chamber acid process.

Solution and Catalysis. An enormous development of the use of catalysts was brought about. The most important catalyst is still water. It has been shown that the removal of the last traces of water after years of patient dehydration materially changes the physical properties of many well known substances. The formation of most polar compounds is inhibited by the absence of water. But the formation of nonpolar compounds is generally promoted by the absence of water. Thus water is both a catalyst and an anticatalyst. Both in water-present and water-absent systems, many new catalysts have been found which promote the reaction desired. For instance, secondary propyl alcohol, formerly a laboratory curiosity, is now being produced in ton lots by the action of sulphuric acid on the gas propene from the cracking of crude petroleum, in the manufacture of gasoline by pressure distillation.

Poisoning of Catalysts. The greatest obstacle to the effective use of catalysts is the ease with which they are poisoned or rendered ineffective. Much research was done in the mechanism and prevention of poisoning. Langmuir showed that a layer of oxygen one molecule deep is absorbed on the surface of a metal so firmly that it remains even when the metal is heated red hot. Poisoning thus probably consists of the absorption of molecules on the surface of the catalyst too firmly to be removed, with consequent decreasing in the effective surface of the catalyst. By finding out and removing beforehand the poisoning substances, the life of a catalyst can be indefinitely prolonged.

Compound Formation with Catalysts and Solvents. The mechanism of compound formation in the presence of catalysts and solvents engaged the attention of many investigators. In many cases the formation of compounds between the reacting substances and the catalyst or solvent can be demonstrated, but whether these be essential or detrimental to the desired

reaction was not settled. Much was done in determining the energy threshold of reactions and its relation to absorbed radiation, but the many questions are not settled as yet.

The Radio-active Elements. If the elements are structures of associated proton and planetary electrons, each group being of increasing complexity as atomic number increases, it would be expected that the point would soon be reached where the atomic structure would be unstable and would slowly or rapidly break down. That this is a fact with regard to the most complex element, uranium, was discovered by Becquerel and Rutherford. Mme. Curie discovered the element radium and its emanation. Soddy, Rutherford and others have explored this field until the path of the degeneration of atoms by the loss of electrons or helium ions from uranium or thorium to lead was accurately known. See RADIUM AND RADIO-ACTIVITY.

The Inert Gases. Production of Helium. The production of helium by liquefaction of natural gas has now assumed commercial proportions, since some natural gas, as from the Texas field, contains as much as 2 per cent of helium. One volume of helium will prevent the ignition of over five volumes of hydrogen, so that a mixture of 85 per cent hydrogen and 15 per cent helium is noninflammable. The new American dirigible *Schenandoah* has proved under trying conditions the reliability of this balloon gas. (See AERONAUTICS.)

Neon. Neon is now used in the preparation of display lighting tubes. These lamps give a very brilliant crimson colored light and are used extensively in theatre advertising, etc. Astor recently examined the last fractions from the distillation of 800,000 pounds of liquid air for possible new inert gases. By means of his "mass spectrograph" he determined that any new inert gas cannot be present in the atmosphere to an extent greater than 1 part in 2,000,000,000,000.

The Alkali Metals. Hydrogen. An immense amount of work has been done on hydrogen in connection with the electronic structure theories of Rutherford, Bohr, Lewis, and Langmuir. The kinetic theory of Bohr is very successful in many ways with the hydrogen atom but does rather poorly with the hydrogen molecule.

Activated Hydrogen. Hydrogen prepared by the decomposition of a metallic hydride, such as sodium hydride, appears to be in an activated condition, as it combines directly with nitrogen to form ammonia and with cold sulphur to form hydrogen sulphide, reactions which do not occur with ordinary hydrogen gas. This unusually reactive type of hydrogen opens up possibilities of more direct syntheses of these important hydrogen compounds, such as ammonia.

Hydrogen Anion. Bardwell succeeded in electrolyzing a solution of calcium hydride in a molten eutectic mixture of lithium chloride and potassium chloride. He proved that the hydrogen was obtained at the anion. In these hydrides hydrogen is thus a negatively charged ion, the first member of the seventh group rather than the first. X-ray diffraction photographs show that crystals of lithium hydride contain lithium cations and hydrogen anions. Such crystals are completely analogous to sodium chloride. Thus the capacity of hydrogen to act as a member of the chlorine group has been completely demonstrated.

Potassium Salts. The world needs a con-

tinuous supply of these salts for the maintenance of soil fertility. Heretofore the supply of these salts has been mainly derived from the enormous deposits in Alsace. In 1922 no less than 1,326,727 tons of potash were produced from them. A serious competitor of the Alsatian fields has been developed in the leucite industry in Southern Italy. This material is a large constituent of the lava from Italian volcanoes and contains 21.5 per cent of potash. It is estimated that these Italian deposits contain no less than 8,786,000,000 long tons of potash; this makes them the greatest accumulation of potassium silicates known.

The Alkali Earth Metals. Calcium Phosphate. The second requirement for maintenance of soil fertility is an abundant supply of phosphoric acid and to a lesser extent of calcium salts. In the United States large deposits are being worked in the southern States, especially in Florida. In the Pacific Ocean a number of the South Sea islands have been found to contain large deposits of this valuable material. These are being worked by both Australian and Japanese interests. (See PHOSPHATE.)

Lithopone. This mixed pigment of zinc sulphite and barium sulphate is being used in enormous quantities in the paint and other industries. Microscopic examination has shown that the particle of this material is not mixed crystals but rather crystalline agglomerates. Their most typical form is a thin diametrical cross similar to that of the "jacks" with which children play. (See ZINC.)

Magnesium in Industry. The use of cast magnesium is spreading rapidly in industries where lightness is an important factor. For instance, cast magnesium piston-rods are an accepted practice in automotive gasoline engines.

Calcium Deficiency in Disease. It is being realized more and more that many diseases, particularly of the rickets type, are traceable in large part to a calcium deficiency in the body. Yet the administration of calcium salts, such as calcium lactate, is useless unless at the same time the skin of the whole body is exposed to the full action of the sun's rays. Then and then only is the calcium assimilated.

The Trivalent Elements. The use of boron compounds as mild antiseptics has spread largely, particularly in the form of the perborates. These have been shown to contain linkages quite analogous to hydrogen peroxide.

Aluminum Alloys. The use of aluminum alloys is an important factor in the automobile industry. The use of cast or open aluminum for household and kitchen utensils has spread widely in the 10 years from 1914 to 1924. The use of light aluminum-magnesium alloys is of great promise in the aeroplane field. They have not so far realized the high hopes raised for them, but continued research will obviate in time their drawbacks and intensify their strong points. Many of these alloys are lighter than water. See AERONAUTICS and ALUMINIUM.

Aluminum Salts. The clarification of water is now almost universally accomplished by the precipitation of aluminum hydroxide by the addition of a calculated amount of aluminum sulphate. Much work has been done in aluminum hydroxide, and the hydrogen concentration most favorable to complete precipitation has been carefully studied. It has also been shown that there are probably many aluminum hydroxides. These vary considerably both in physical and

chemical characteristics according to their method of preparation. The salt, ammonium aluminate, has been prepared. This salt, of a very weak base and a very weak acid, would be expected to be hydrolyzed almost completely in water solution. Instead it is surprising to note that Heyrovsky found it quite stable in solution.

The Quadrivalent Elements. The development of carbon compounds is discussed elsewhere. See CHEMISTRY, ORGANIC.

Silica Gels. The finely divided silica gels have shown wide usefulness in industry. Traces of ether, alcohol, and sulphur dioxide will be completely absorbed by this reactive colloid. It is also being used in the purification of gasoline from the cracking processes and in the removal of sulphur from petroleum products.

Titania in Glass. Much work has been done recently on the use of titanium oxide in glass. It makes a glass superior to either the lime or the magnesia glasses. At the same time it gives a high thermal endurance, and consequently it is being used largely in the production of heat-resisting glasses.

Diffusion of Gases through Fused Silica. R. C. Burt, J. Johnsen, G. A. Williams, and others have recently studied the diffusion of gases through transparent silica. Hydrogen diffuses through fused silica even at room temperature at high vacuum. At 500° C. the diffusion of helium through fused silica is 22 times that of hydrogen.

The Quinivalent Elements Ammonia. About 1910 the most serious problem before the world was the rapid exhaustion of the mundane supply of combined nitrogen. The work of the last 10 years has solved this problem. The names of Haber and Nernst will always be linked with this effective attack on an important problem by advanced thermodynamic investigations. Schulback and Ballauf (*Berichte*, vol. iv, 1921) have prepared free ammonium, NH_3 , in about 50 per cent yield by the addition of a 1.8 per cent solution of potassium in liquid ammonia to a 1 per cent solution of ammonium chloride in liquid ammonia at -70° C. Much work has been done on the selection of the proper catalyst for the oxidation of ammonia to nitric acid. Manganese, platinum, iridium, etc., have been chiefly used as catalysts, giving efficiency well over 90 per cent. Hydrogen phosphide is a serious poison for the platinum catalyst. As little as 0.00002 per cent will reduce the oxidation 30 per cent and is very difficult to remove.

Phosphorus. Much attention has been given to the fine grinding of phosphatic slags for fertilizer purposes. It is realized more and more that the more surface is exposed to the action of soil agents, the more available will the slag constituents be, so that even a very low phosphate slag can be made available if ground sufficiently fine.

The Oxygen Group. *Pure Hydrogen Peroxide* Maass and Hatcher (*Journal of the American Chemical Society*, vol. xlii), have prepared chemically pure hydrogen peroxide. When free from water it is quite a stable substance. Electrolytes dissolve in it quite readily and ionize to approximately the same degree. It is much more diamagnetic than water and hence does not contain the molecular linking characteristics of molecular oxygen.

Ozone. Liquid ozone is only partly unstable

with liquid oxygen and can be separated from it by fractional distillation. The pure ozone so obtained does not appear to contain any other polymer of oxygen. Ozone oxidizes nitrogen tetroxide instantly to the pentoxide, the end of this reaction being indicated sharply by the disappearance of color, so that a true titration of one gas by another can be performed. Ionized air is now being exclusively used in many industries; for instance, it is being used to kill molds and yeasts in the preservation of food stuffs. It is also being used in the manufacture of linocyn for linoleum from linseed oil.

Sulphur The use of molecular sulphur as an insecticide has increased of late years. When the soil is inoculated with a bacterium which can oxidize sulphur, the addition of sulphur is effective in controlling a number of plant diseases.

Vulcanization of Rubber. The vulcanization of rubber by heating it with molecular sulphur is still being studied with the greatest diligence. The evolution of "accelerators" which markedly hasten vulcanization has transformed the whole rubber industry. Twiss has studied the effect of various forms of molecular sulphur and finds they all vulcanize rubber equally well. Molecular selenium has been tried as a vulcanizing agent and acts rather poorly.

Selenium Oxychloride This remarkable compound is a solvent for the most diverse types of material. Most of the metals are attracted by it with the formation of the corresponding metal chloride. The solution of molybdenum trioxide in selenium oxychloride shows a striking photochemical reaction. On exposure to bright light it rapidly becomes blue. On removing the light the solution regains its original pale yellow color in a few hours. Selenium oxychloride activates retorted carbon, markedly increasing its absorptive power.

Halogen Group. Chlorine. Liquid chlorine is now used in enormous quantities in the sterilization of water supplies. No other method has been found so reliable and certain. To-day the water supply of practically every large city is chlorinated before delivery to the user.

Iodine. The abundant fresh water of the Great Lakes District of the United States has succeeded in removing practically all the iodine from this territory. Hence it was found that practically whole communities in Wisconsin, Michigan, etc., were afflicted with goitre. This has been obviated by adding small amounts of iodine salts to the drinking water supply, to the salt sold in such districts, etc. In this way an alarming situation has been remedied. See CHEMISTRY, ORGANIC; CHEMISTRY, PHYSICAL.

CHEMISTRY, ORGANIC. Organic chemistry is that part of the science dealing with the chemical constituents of living matter and its products, actual or potential. As far as can be known, life processes always depend on the presence of a carbon skeleton. Just as the chemistry of geology is largely the chemistry of the symmetrical element silicon, so life chemistry is the chemistry of the symmetrical element carbon. The organic chemist has been separated from his inorganic confrère by two characteristic convictions: first, that the molecules he dealt with had a definite discoverable spatial arrangement of the constituent atoms, and secondly, that his reactions were the interaction of molecules, not, apparently, of charged ions.

The recent work in many separate branches of natural science has shown that the organic chemist's convictions were justified. The work of Langmuir on thin films of organic substances and of Laué, Bragg, and others on crystal structure have shown that there is ample first hand evidence for the spatial chemistry of carbon compounds. The work of the physicists on the resonance potentials of molecules has shown that there are all types of activation of atoms between the charged ion and the inert state of molecules. Hence there is no reason to limit chemical interactions solely to this extreme state of the charged ion.

But even in this less definite activation of organic complexes, the physical chemical laws deduced from ionic systems seem to hold to a large degree. Nelson and Conant both have found that oxidation and reduction potentials are just as definite in organic equilibria as in inorganic. In the same way, the phase rule, the law of mass action and other generalizations of physical chemistry (q_v) have been shown to hold largely in organic equilibria. But it should be remembered that conditions which obtain in water systems do not necessarily dominate likewise in organic equilibria. For instance, it has been shown by the work of Reed, Norris, and others that in the esterification of organic acids, the carboxylic acid acts definitely as a base, losing hydroxyl rather than hydrogen. The same reversal of electrical character is to be noted even with so strong an acid as sulphuric acid in the sulphonation of benzene. Thus it is demonstrated that no chemical compound is exclusively an acid or a base; all are amphoteric, and the basic or acidic character depends on the system surrounding the molecule in question.

Then again it is seen very strikingly that the capacity of an atomic complex to become a stably charged ion depends on the degree to which the charged atom is loaded with heavy substituting groups. Thus NH_4^+ is a very instable and sensitive ion, whereas the corresponding tetramethyl ammonium ion $(\text{CH}_3)_4\text{N}^+$ is quite stable. NH_4OH is a very instable compound and a comparatively weak base. $(\text{CH}_3)_4\text{NOH}$ is a stable compound and as strong a base as potassium hydroxide itself. The same phenomenon is seen in the ion triphenylmethyl. The ion CH_3^+ is so instable as to be undetectable, whereas the substituted ion $(\text{C}_6\text{H}_5)_3\text{C}^+$ is quite stable as ions go. The same phenomenon has been discovered in other heavily substituted complexes, such as $(\text{C}_6\text{H}_5)_3\text{N}$ and $(\text{C}_6\text{H}_5)_3\text{P}$.

Purely organic research can thus throw light on the mechanism of ion formations and the vexed question of strong electrolytes. It was in carbon complexes that the celebrated quantum theory of Planck received its first notable confirmation. Einstein, the author of the celebrated relativity theory, showed that the specific heat curve of carbon agreed remarkably well with the relationship predicted by the quantum relationship $K = SL - hv$. It was found that this agreement was limited to carbon and a few other elements; for most of the elements the more complicated emendations of Lindemann and others were in better agreement with experimental data. It is for this reason that carbon, etc., are known as Einstein (heat) bodies.

It follows from the agreement of carbon with the simpler quantum expression that its energy relationships must be comparatively simple.

And this has been borne out by experimental work on many of the physical properties of carbon compounds: the specific rotation, the specific heats, the magnetic susceptibility, etc. In many of these properties the numerical value can be predicted by a summation of the atomic values. It follows that the molecular effects are in many carbon structures merely the summation of the atomic effects.

If the Einstein expression for the specific heat be solved for average temperature, it will be found that only one atom in 96 is emitting heat energy. The other 95 are not emitting heat energy. This would explain the simplicity of the energy relations of carbon compounds. Only one per cent of the carbon atoms are distorting their electrical fields of force by emission of an electromagnetic pulse; hence the electrical stresses surrounding the other 99 per cent are comparatively at rest; therefore the spatial equilibrium is simple and stable.

The Quantum Explanation of the Stability of Carbon Compounds. The stability of carbon structures on the quantum hypothesis would therefore be explained by the symmetrical electron structure of the carbon skeleton and hence the minimizing of asymmetrical sub-molecular stresses in the molecular fields of force; the lack of disturbance of the atomic fields of force, since 99 per cent of the carbon atoms are absolutely quiescent, from an energy emission standpoint, and the small cascade of energy involved in carbon rearrangements because of this symmetry and inertness. Since the carbon atoms are quite symmetrical electronically and practically quiescent as to energy emission, it is immaterial how they are arranged. It is found by experiment that most of the usual types of organic reactions show very little energy change. It follows that the equilibria are never very far to the right or the left and that many simultaneous reactions can be expected to occur alongside of each other. When water trickles down a very slightly tipped plane it tends to run a great many ways at once. So it is with organic reactions.

Contrast between the Polar Reactions of the Asymmetrical Atoms. Thus is seen the marked contrast between the formation of polar compounds of the ions of the non-central elements, the salts, acids and bases of inorganic chemistry and the nonpolar compounds of organic chemistry. G. H. Lewis and others have called attention to the importance of the magnetic field in nonpolar molecular compounds. Bragg found that the crystal cells of organic compounds were built up of two or more organic molecules, as opposed to the simpler ion structure of the polar cells, and furthermore that the crystal cell of even-numbered carbon compounds is, as far as investigation has shown, quite different from the crystal cell of odd-numbered carbon compounds. This would emphasize the importance of the magnetic fields of nonpolar compounds.

The Cubical Atom in Organic Compounds. The Lewis-Langmuir cubical atom has found its most successful application in carbon molecules. Andrade has called attention to the fact that in a very eccentric elliptical orbit, an electron can for many energy expressions be regarded as at rest at the second focus of the ellipse. Lewis has called attention to the fact that in the cubical atom the term "electron" is taken to include the electrical electron and its orbit.

It is probable that the work on stable carbon structures will in the future bring about the synthesis of these two views of atomic structure.

Synthetic Work in Organic Chemistry. *The Use of Catalysts.* The work of the famous French organic chemists Sabatier and Senderens called attention to the immense possibilities of catalysts in organic preparations. To-day the most important commercial applications of organic processes are bound up with the use of catalysts, the hardening of fats, the cracking of petroleum, preparation of dyes, and hundreds of other processes are intimately linked with the use of the proper catalysts. Molinari, Morgan, and others have worked on the influence of energy catalysts, such as the electromagnetic pulsations which we know as light, in the rearrangement of organic compounds.

Photosynthesis. The most important chemical in the whole world is chlorophyll. Without it, the existence of the ordinary vegetable or animal life on this planet would be impossible. Willstätter and other investigators have made available some knowledge of the constitution of chlorophyll. Mainly, it appears to be an aggregation of substituted pyrroles linked very stably with magnesium. Much work regarding the synthetic action of chlorophyll on carbon dioxide has recently been done. Other catalysts such as an uranium sol have been shown to bring about the same type of photosynthesis by the aid of sunlight. See BOTANY.

Hæmoglobin. Much work has been done on the blood pigment hæmoglobin by Willstätter and others. It has been shown to be closely allied to chlorophyll in its constitution, except that the pyrrole nuclei are linked up with iron instead of magnesium.

Organo-metallic Compounds. The whole subject of the metallic compounds of carbon complexes has assumed great importance. The alkyl metallo-halides, such as the magnesium and zinc compounds, have been of the greatest importance in synthetic work. Nelson and his pupils have shown that this type of compound is polar rather than of the usual nonpolar type. The aluminium complexes present in the Friedel-Craft reaction have also been shown to be polar. In fact, from a complex of aluminium chloride with benzene, metallic aluminium can be deposited by the passing of an electrical current through the benzene solution.

The nonpolar metallo-organic compounds have also shown great interest. Every one is familiar with the arsenic carbon compounds used by Ehrlich under the names of salvarsan and neosalvarsan. Other metallo-organic compounds showed promise in chemotherapy, such as silver salvarsan and copper salvarsan. Metallo-organic complex ions, such as the bismuthio-tartrate, have shown surprising efficiency in attacking bacterial invasions of the blood stream.

Tetraethyl lead has a surprising effect as an "anti-knock" material in gasoline engines. One part in 200,000 is quite effective in preventing knocking. See MOTOR VEHICLES.

Carbon Compounds. The effect of a carbon compound on living matter is quite frequently localized to one small part of the carbon structure. The synthetic chemist has therefore been busy in eliminating that part of the molecular structure which is unimportant and increasing the physiological action of the remainder by appropriate mutations. Thus ethylene, which contains the carbon skeleton of ethyl alcohol and

ethyl ether, has been shown to be quite an efficient anæsthetic and to minimize the unfortunate after effects of etherization. From the complicated alkaloids have been evolved simpler structures which do the work wanted without unpleasant concurrent effects. For instance, from the habit-forming local anæsthetic cocaine has been developed the far more effective novocaine with no habit-forming properties.

Dyes. Innumerable new dyes were prepared. Many of these new dyes have other interesting properties. One, kryptocyanine, is the most powerful sensitizer known for rendering photographic silver emulsions sensitive to red and green light. Other dyes have been shown to be powerful bactericidal agents. For instance, trythan red is an excellent trypanocide and is used in combating the dreadful sleeping sickness of Middle Africa. Acriflavine and fluorescein have proved excellent agents in aborting infections of the urethral passages.

Carbohydrates. Much work has been carried out on the polysaccharides, and fields that were formerly unknown have been successfully explored. Fischer showed that the natural tannins are the glucose esters of the tannic acids. Taylor has shown that the starches naturally occurring are characterized by the presence of various fatty acid esters of the glucose complex. The work on fibre silk from cellulose has necessitated an intense exploration of the cellulose and hydrocellulose field.

Stereo-chemistry. Progress was made in the study and synthesis of stereo-isomers. The importance of stereo configuration in biochemistry is now realized. Emil Fischer, Abderhalden, and their students did a great deal of work in the syntheses of the polypeptides, approximating the natural proteins. Chains that contain over a hundred atoms have been prepared, and such compounds have been shown to give practically all the characteristic reactions of the simpler proteins. There seems no structure of carbon complexes, short of the living cell, that the organic chemist cannot attempt to duplicate with some reasonable hope of success.

The Disintegration of Organic Compounds. Carbon compounds are important not only for their own characteristics, but also for the power, heat, etc., that can be generated by their disintegration. Thus the main importance of the paraffin and polymethylene compounds to-day is their fuel value, regrettable though this may be. In the same way the great coal and peat deposits are utilized mainly as fuel; only the by-products are conserved for chemical utilization.

Explosives. The necessities of the War developed greatly the technique of explosives. These are mainly nitrates of carbohydrate compounds. The Americans and the Allies were to a great extent quite unprepared for the large scale production of high power explosives, but the chemical industries rose to the needs of the nations. At the end of the War, the Allies were in a much better position as to high power ammunition than the Germanic nations. See EXPLOSIVES.

Chemical Warfare. A closely allied field in organic chemistry was the development of military attack by means of chemicals. This new branch of warfare took advantage of the marked effect on human beings of many organic compounds. Poison gases, tear gases, "sneezing" gases, all were developed in number. The most

successful and important of these was "mustard gas." This material, made by the action of sulphur chloride on ethylene chlorhydrine became one of the most important agents in aggressive warfare. In peace time, the use of the tear gases has continued in the dispersion of dangerous mobs and the capture of reckless criminals at bay. See **CHEMICAL WARFARE**.

Combustion of Carbon Compounds. All carbon compounds, in the presence of an excess of oxygen at high enough temperature, are turned to carbon dioxide; water and the oxygen compounds of other elements are present. This is the standard method for the ultimate analysis of carbon compounds. The material is converted in a combustion furnace to carbon dioxide and water and these two substances collected separately and weighed. H. L. Fisher and others have brought these ultimate analyses to a high degree of accuracy, through the proper control of the methods used.

Production of Energy and Heat by Combustion. To-day most of our artificial heat, and to a large extent, our greatest power, comes from the oxidation of such carbon compounds as paraffin, coal, etc.

Prevention of Combustion. Experience has shown that the most inert carbon compounds, without any exception, can be made to explode if in fine enough a powder. It has been realized, particularly of late years, that all processes producing dust should be controlled by the use of dust collectors, forced draft and the like, so as to minimize the accumulation of dust. The modern chemical plant rivals the kitchen of a famous chef in its scrupulous cleanliness and absence of dirt and dust.

The Coking of Coal. The War brought the distillation products of coal to the front. These products had been greatly neglected in the United States and ignored in the United Kingdom because of the abundant standardized supply of these materials from German sources. The War changed this abruptly. It is now well realized that the older method of the carbonization of coal without the recovery of ammonia, benzene, and other by-products, is a criminal waste of national resources. See **COKE**.

It has been gradually realized that the most useful method of carbonizing coal is that at a high temperature. A high gas yield is obtained at the same time as a high yield of liquid products. The maximum yield of ammonia is obtained, as well as a hard dense coke of the quality most desirable in blast furnace operations. More and more the coal resources of the world will have to be conserved by scientific coking at the mine and the distribution of the products to appropriate industries. More and more the use of coal for industrial power will revert to the electrical generation of power at the coal mine, combined with the water power that is available in the vicinity.

Petroleum and Natural Gas. The motor industries are wasting one of the most valuable natural resources in the generation of power by the combustion of petroleum products in automotive engines on land and sea. The logical fuel for such purposes is ethyl alcohol from plant carbohydrates. The plant world every year makes many millions of tons of carbohydrates which are allowed to be disintegrated into carbon-dioxide by the actions of molds and yeasts. This material ought to be converted to the intermediate carbinol, ethyl alcohol, and

this used for the fuel needs of the automotive industry. Ultimately, when the world has exhausted most of its petroleum resources, it will be forced to turn to this easily replenishable source of energy. But in the meantime, the valuable reservoirs of paraffin and polymethylene derivations in the petroleum resources of the world will have been dissipated and lost.

Already agitation has begun to save the natural gas resources for their proper utilization in industry. The only mundane source for any large supply of the valuable gas helium lies in our natural gas wells. The valuable chemicals methyl chloride, carbon tetrachloride, etc., can be made from natural gas. Soon our supplies of methyl alcohol, formaldehyde and the like will come from this same source. To-day we are wasting them as a mere cheap fuel source.

Shale Oil. The world's oil resources in oil shales are enormously larger than its supply of petroleum oil. McKee has shown that these oil shales are to a great extent the calcium salts of complex oily acids. On distillation these salts break down with an absorption of about 160 British thermal units per pound of shale. Further heating causes dry distillation of the compound found with the production of shale oil. One field alone has been shown capable of producing 80 times more oil than all the petroleum wells of America have yielded in the whole history of petroleum production.

Cracking of Petroleum. The urgent demand produced by the increased use in automobile vehicles has compelled the petroleum industry to convert, as far as possible, its crude material into the lighter, more volatile hydrocarbons. The first process which proved successful on a large scale was the Burton process. This consisted of the direct firing of petroleum stills under greatly increased pressure. In this way the yield of the lower fraction is much increased. Other methods such as the Ellis, Cross, and Dubbs processes have more or less superseded the Burton process. They are directed toward the maintenance of the liquid state during the "cracking" period. The carbon necessarily formed in the decomposition is removed in special settling chambers.

The liquid-phase cracking processes possess many advantages over the older vapor-phase processes. They can deal with much heavier petroleum, such as the California and Mexican crudes. They produce much smaller proportions of uncondensable gas. The lighter fraction is of much better quality and more easily refined.

Transformation of Natural Organic Products. The immense amount of technical work on cellulose and artificial silk has steadily increased the quality of these textiles. In 1922, 75,000,000 pounds of artificial silk was produced, and even this quantity was insufficient for the demand. At first the artificial silk filaments were poor in strength and were not resistant to wetting, etc. By improvement in technical methods, such as the proper aging of the solutions at low temperatures, the properties of artificial silk have been much improved. It has also been possible to make much finer filaments than before, by elimination of minute gas bubbles in the threads, etc. See **SILK, ARTIFICIAL**.

Constitution of Cellulose. J. C. Irvin and E. L. Hirst have at last been able to obtain

definite evidence pointing to the probable constitution of cellulose. Their formula is a trianhydro-glucose of the butylene oxide type. Their formula will account for all the known reactions of cellulose, whereas the older suggestions have all failed in one respect or another. (*Transactions of the Chemical Society*, vol. exxiii, 1923, pp. 123, 518.)

Relation of Cotton Cellulose to Wood Cellulose. L. E. Wise (*Industrial Engineering Chemistry*, vol. xv, 1923, p. 711) has investigated the relationship of cotton cellulose to wood cellulose. He finds that the balance of evidence is in favor of a more variable complexity for wood cellulose as compared with cotton cellulose. The most resistant part of wood cellulose is almost identical with cotton cellulose, but the wood cellulose complex as a whole is different from cotton cellulose in containing other and less stable groupings.

Paper. The most notable innovation in the paper field has been the introduction of rubber latex papers, in which rubber latex is added to the paper pulp. These papers are noticeably tough and resistant when properly made. So far the main difficulty has been the prevention of the perishing of the rubber due to its extruded surface and the consequent deleterious action on it of oxygen from the air.

Lignin. Extensive work has been carried out on this important constituent of the natural woods, straw, and other fibres. The evidence has accumulated that it is somewhat the oxygen analogue of chlorophyll, being built up of furane ring condensations as chlorophyll is of pyrrole aggregations. It also contains aldehydic linkages and phenol radicals more or less methylated. These methoxy groups are the source of the methyl alcohol obtained in this dry distillation of wood.

Simpler Carbohydrates. The starches are the typical storage carbohydrates of plant life. As energy-giving substances they are one of the principal constituents of food for both animals and human beings. In the preparation of pure starch from vegetable grains, the proteolytic power of enzymes has been recently utilized. Pepsin or trypsin is used to render soluble and remove the insoluble nitrogen constituents of the crude starch. The starch granules are then centrifugated out.

Dextrin and Vegetable Gums. These are invariably prepared by the partial hydrolysis of the natural starches. The methods used are mostly empirical and have been developed by haphazard experiments. Kunz-Krause has isolated a cyclic ester of myristic acid from dextrin, which is the source of its characteristic odor.

Sugars. An immense amount of work on the monose, biose, and triose sugars has demonstrated more completely each year the soundness of the Fischer theories and methods of attack. The various sugars have been shown to have interesting properties. Thus lactose has been shown to have the power of killing off the tryptophan attacking bacteria of the upper intestine. If this sugar could only be produced cheaply enough, it would be a great aid to the health of human beings.

Sucrose. The most important of all sugars is the biose sucrose. The technique of the production of this material both from sugar beets and from sugar cane has been carefully studied year by year. From sugar cane, as high as

99.42 per cent of the sucrose in the crude cane has been recovered in commercial operations.

Bleaching and Clarifying. The extracted sucrose is accompanied by colloidal gummy matter and by coloring substances. The first is removed by liming and the second by treatment with a decolorizing carbon. C. Müller and M. Bird have shown that much of the colloidal matter is a complex silica compound from the sheath of the sugar cane and can be removed by superheating.

High Power Decoloring Carbons. The introduction of high power decoloring carbons such as norit or carbox has had an important effect on the sugar industry. The tendency appears to be to remove, as far as possible, the colloidal impurities by preliminary treatment and then to rely on a small quantity of high-power bleach to remove the color. As little as 12 ounces of high-power bleach will decolorize the juice from one ton of sugar cane.

Carbinols. Glycerol. The production of glycerol from sucrose has been brought about by means of a special yeast acting in the presence of sodium sulphite. The sulphite removes the aldehyde formed and thus allows the concentration of glycerol to increase. During the War considerable glycerol for war purposes was made by this method.

Isopropyl Alcohol. This, the simplest of the secondary alcohols, was long a laboratory curiosity. Now it is produced and sold in car-load lots under the name of "petrolol." It is a by-product of the cracking of petroleum. The gas propense is found, and this is led into cooled sulphuric acid. The acid sulphate found is diluted and distilled, with the production of isopropyl alcohol.

Thus is seen the progress of chemical work on the carbohydrates from the most complex cellulose to the simplest carbinols. In the same way similar advances have been recorded in the proteins, the tannins, the caoutchoucs, the hydrocarbons, the vegetable oil fields. Slowly and surely the organic chemist is linking up the most complicated products observed in nature to the simplest products of organic laboratory preparations. See CHEMISTRY.

CHEMISTRY, PHYSICAL. Physical chemistry is not a separate science but a group of methods whereby the conditions preceding and succeeding chemical reactions can be studied. It should be remembered that chemistry and physics are inseparable. All the operations surrounding chemical reactions are physical in nature, while all the manifestations of force occur in the electrical field surrounding electrons and proton or the groupings of these two types of electricity which we call ordinary substances. Hence the application of well tested physical methods to chemical investigation has been of immense aid to the chemist. In the same way much chemical work has been of aid in investigating physical phenomena.

The Simple Functions for Chemical Phenomena. The physicist is often able to express the relations of cause and effect in physical phenomena by means of comparatively simple mathematical expressions. Thus the relationship of volume, pressure and temperature of most gases can be shown to a surprising degree of accuracy by the simple relationship, called the gas law, $PV = RT$, when P is the pressure, V the volume of the gas (in molar volumes), T the absolute temperature and R the gas con-

stant. Hence physical chemists have been attempting to find simple expressions that would in like manner satisfactorily account for the operations of chemical reactions. Many of these expressions show high promise. The important law of mass action of Guldberg and Waage has been applied to a number of chemical phenomena with surprisingly good results. But increasing accumulation of more accurate data has in nearly every case shown that this agreement is only approximate and that in general the simpler the expression, the more limited is agreement with data of increasing accuracy.

To minimize the discrepancy between actual fact and simple mathematical theory, the physical chemist has been driven to the creation of ideal substances, imaginary liquids, gases and solids, whose characteristics would correspond exactly to those indicated by simple mathematical functions. The discrepancies between actual experimental results and the theory adopted are then discussed as mere departures from an ideal state.

This procedure is excellent as a method of teaching, but it is dangerous as a view of natural phenomena. There is no distinction between the normal and the abnormal in nature. Conditions in a few selected systems may be somewhat simpler than in others, but rarely are the relationships so simple as to be expressible over a wide area by a function containing only one constant.

Conditions of Chemical and Physical Experiment. It should be remembered that physical experimentation to-day can generally be disentangled from interfering phenomena much more easily than the usual type of chemical experimentation. Take as an example the familiar physical experiment of the pendulum. Here the physicist can easily do away with the friction of the air by conducting the experiment in a vacuum. He can use as support a quartz filament so fine as to be seen only through a microscope. He can make very accurate corrections for temperature differences. The investigator of chemical phenomena is not so fortunate. To illustrate the complexity of most chemical experiments we may imagine the physicist attempting to study the action of an iron pendulum suspended by a stiff spring and swinging in a bath of cold molasses while subjected to a varying magnetic field. This imaginary comparison will help show why physical chemists have had such poor success in gaining accurate agreement between experimental data and the simple mathematical relationships we call laws. The attempt is being made to express a complex system by means of a simple mathematical expression. The more complex the situation, the more striking become the discrepancies as the data available becomes more accurate and more abundant.

We ordinarily write our chemical equilibria as if we were observing the interaction of a few molecules or atoms with each other. But the actual fact is that even the simplest chemical experiment involves trillions and quadrillions and quintillions of atoms and molecules, with electric potentials and charges, the formation of complex aggregates, the segregation into colloidal dispersates, and other effects to increase the complexity. To say nothing of energy differences, threshold values, and various activation phenomena that have their effect on the system. Hence it is surprising, not that the

simpler generalizations of physical chemistry show many discrepancies as more abundant and more accurate data becomes available, but that the agreement is as good as it is.

Take, for instance, the extremely important Moseley experiment on the characteristic X-ray radiations of elements. Further and more accurate measurements show that the Moseley relationship is not quite valid but is rather in the nature of a good approximation. But no one doubts that the theory of atomic numbers is true. It is only realized that the conditions existing around the nucleus and the innermost ring of electrons are not as simple as Moseley imagined they were when he formulated the simple mathematical expression or law known by his name.

X-Ray Study of Pure Crystals and Liquids. The X-ray method of studying the structure of pure chemical compounds has yielded an immense amount of valuable information regarding the spatial structure of such compounds. With solid solutions, for instance, it has been shown that the atoms of the two metals simply substitute in each other's lattice with only slight disarrangement of the lattice, instead of having two interlacing lattices. Of most of the simpler molecular structures we can now give accurate dimensions and spatial arrangement.

The Phase Rule. This important generalization by an American scientist, Willard Gibbs, has been of the greatest aid in studying the reactions in metallography and the like. During the War it was used to study the characteristics of explosives and so prevent the premature explosion of high power ballistics. The extraction of potash salts on the Pacific Coast was worked out by means of this same phase rule. This rule states that for N components and R phases the degree of freedom, or possible variation in the conditions, is $N - R + 2$.

Catalysis. When a system, or mixture of substances, is heterogeneous (not all of a kind), one component is very apt to influence chemical reactions in the other. This property of influencing a chemical reaction without apparent change is called catalysis. Thus many chemical changes that occur exceedingly slow can be brought to equilibrium quickly by the addition of a catalyst. In the same way reactions may be slowed down or stopped by means of other substances called anticatalysts. Modern chemical work is therefore greatly concerned with catalysts and anticatalysts, to see that the type desired is present and the detrimental type eliminated. The work done by the immense water power development at Muscle Shoals in the South will be intimately linked up with catalysis.

Adsorption. The atoms in the surface of a solid have their electrical fields only partially satisfied. Thus they are able to attract and hold the atoms of many other substances, liquid or gaseous. In fact, nearly all solids have adsorbed onto them layers or films of other substances. In such layers chemical reactions go on quite differently from what they do in ordinary mixtures. This is thought to be the reason for the capacity of catalysts to influence a chemical reaction. Not only solids but also liquids possess this power of attracting and holding others. This attraction is called the interfacial tension. Nearly all ordinary substances have a film of water on them which in-

fluences greatly their chemical characteristics. More and more it has been found how markedly these small matters influence chemical action.

Colloidal Dispersion. This interfacial tension is not noticed in ordinary solids, but when a material is very finely subdivided its surface greatly increases. Thus a little button of silver as big as a shoe button has a very small surface, but if reduced to a fine enough powder it will have a total surface as great as a city lot. In this condition, called the colloidal state, silver has a great power to kill germs and is so used in many infections of the throat and other passages.

It has been shown that a great many of the simple salts are really very fine solid particles floating in water and can be filtered out by a very efficient filter. In this way the yellow solution of potassium dichromate can be completely removed from a water solution and ink can be filtered water-white.

Removal of Smoke and Fumes from Air. The fumes accompanying many chemical operations, such as the burning of carbon or coal with insufficient air, are colloidal dispersions of tiny solid particles in a gas, in this case the ordinary atmosphere. Like most colloidal dispersions, these tiny solid fragments have on them an electrical charge which keeps them apart by making the particles repel each other.

It has been found that an electrode charged at 10,000 volts or more will attract these tiny charged particles out of the gas and so prevent their being carried into the outer air. In this way fumes from smelters have been prevented from polluting the air and the material so saved becomes a profit instead of a nuisance. This recovery of solids from gas dispersions has found many applications in industry, as, for example, in the manufacture of the pigment carbon black from the partial combustion of natural gas. A recent development has been the use of a quartz mercury lamp to ionize more effectively the dispersed particles. Similar tiny charged particles in a liquid are called sols. It has been found more and more that a great many of the systems we have regarded as molecular solutions are in reality sols. This has radically affected much of our thinking about solutions.

Dr. H. S. Hele-Shaw has devised a very effective new filtering apparatus. This consists of a large number of sheets of hardened paper perforated with holes and pressed together under an adjustable pressure so that the holes in register form tubes. Half the tubes are inlet tubes; half, outlet tubes. On pumping the liquids to be filtered into the inlet tubes, the liquid in continuous phase passes between the paper layers and out into the outlet tubes, leaving the discontinuous phase behind. By suitable pressure any degree of separation can be obtained. Even such strong electrolytes as potassium bichromate and sodium sulphate can be removed from solution by this streamline filter. It is also excellent for clarifying liquids difficult to filter, such as glues and varnishes.

When sols, such as have been referred to, cool or are treated with a coagulating agent they set to a jelly-like mass or "coagulate into a gel." These relationships of sols and gels are most important to human beings, as life, as far as we know, occurs only in sols and gels. Hence an immense amount of work has been done in biological chemistry, with the accumula-

tion of information of increasing complexity. Particular progress has been made in research on the action of certain sols on gels. Donnan, in his work on membrane equilibrium, has shown the results that will occur when one part of a sol can diffuse or wander into a gel and another part cannot. By his investigations the technique of whole industries, such as the tanning of leather, has been radically changed. Loeb has likewise shown how one condition, such as the hydrogen-ion concentration, can radically affect the characteristics of a sol.

Enzyme Actions. Certain complex organic substances seem to have a remarkable catalytic action in sols and gels. These are called enzymes. In many cases their action extends into the solutions of complex substances that border on the colloid dispersals, such as sugar solutions. Here the work of Sorensen, Nelson and others has accumulated an immense amount of data which will help us understand the complexities of chemical change in these important systems. The action of bacteria, yeasts, molds, and the like organic substances is mainly through enzymes, and these too seem closely bound up with physical chemical laws.

Liquids. Langmuir has shown that liquids can be spread into a film one molecule thick. In such thin films the volume of the individual molecule is always the same, no matter what the interface. He has therefore suggested that a liquid is really like a crumpled piece of paper which can be smoothed out to a definite thinness as a limiting value or be wadded up into any shape desired. In liquids many investigators have shown that compounds exist. First of all the liquid may be combined with itself. Then it is called an associated liquid. The non-associated liquids are few in number and comprise the more inert organic compounds such as the paraffins, the ethers, etc.

Compound Formation in Liquids. If a liquid can form stable compounds with itself, it is probable that it can form stable compounds with other substances. For instance, water, which is highly associated in its liquid state, enters into combination with a large number of substances; many of these compounds are crystalline. Such crystals in the past were thought of as containing "water of crystallization." But such compounds with water are not a whit different in kind from the material formed by the action of water on SO_2 to make sulphuric acid. In liquid systems compounds are also found. By observing the abrupt changes in physical characteristics during a continuous variation of constituents, the existence of numerous compounds has been demonstrated in such systems.

Ionization. Kendall has called attention to the fact that such compound formation always appears to precede ionization. Other investigators appear to regard the formation of charged ions in a solution as merely the action of the solvent on the solute. The ionization of weak electrolytes has been shown to follow the law of mass action by Ostwald and other workers. Recent work has cast increasing doubt on the value of conductivity measurement of ionic concentrations, and the Ostwald dilution law is regarded as approximate rather than as a rigorous expression of fact. Strong electrolytes do not follow this law. Many physical chemists, such as Noyes, Ghosh, Lewis, and others, have come to regard strong electrolytes as wholly

ionized, so that the molecular species has entirely disappeared. So far the controversy has not been settled. The simple ionic theory that Arrhenius thought would solve all our difficulties in the field of solutions is thus seen to have given rise to more and more complications. An American physical chemist, Kraus, has shown that ordinary metallic conduction by the movement of unattached electrons and electrolytic conduction by the movement of charged ions may occur simultaneously. Such conditions do exist, for instance, in solutions of metallic sodium in liquid ammonia.

Electrolytic Solution Pressure. In the phenomena of oxidation and reduction, Ostwald has shown definitely that there is the same electronic transfer as in the deposition of one equivalent of a metal on a cathode. He formulated a very interesting theory of the electrical relations between metals and their ions, called the electrical solution pressure theory. He and other investigators have shown that very definite electrical potentials exist between metals and the concentrations of their ions. Likewise definite potentials exist between oxidized and reduced forms of the same ion in solutions. Conant and others have shown that in the same way quite definite potentials exist between oxidized and reduced forms of organic compounds, and that these potentials follow physical chemical laws even though the phenomena of ionization seem to be absent or exceedingly slight. Sanford has called in question the whole electrolytic solution pressure theory. He shows that the pressures calculated ought to make many metals explode in the presence of a trace of water, whereas they do not. Sanford also showed that the potential between a metal and a solution appears to be a function of the dielectric constant. Substances which raise the dielectric constant, such as alcohol, increase the electromotive force, whereas substances which decrease it, like urea, decrease the electromotive force.

Importance of Hydrogen-ion Concentration. One fact seems to tower above all this work on solutions of the years 1914-24; this is the importance in all such chemical reactions of the concentration of hydrogen-ion present. This has become apparent in the most diverse systems, from the purification of water to the suppression of malignant bacteria in the small intestine. Gas reactions, as the simplest systems available for chemical study, have received much attention from physical chemists. The results have been strikingly good.

Ionization and Resonance Potentials. As chemical reactions bring about the exchange of rearrangement of electrons, the necessary force to remove an electron from an atom, to either a short distance or a great, becomes of high importance in the study of gas reactions. Many of these potentials have been studied attentively. For the hydrogen molecule, no less than eight such potentials have been observed and can be explained. Other molecules show even greater complexity.

Radiation Theory of Reaction Velocity. The kinetic theory failed lamentably to explain the enormous change of reaction rate with change of temperature. The attempt has been made by Lewis, Langmuir, Dushman, and others to show that S in the relativity equation $K = SL - \frac{h\nu}{kt}$ can be taken as a radiation frequency. Dushman and Lewis have worked out

radiation equations for gaseous reactions which agree fairly well with experimental data. This would bring chemical changes into line with the general reasoning of the important relativity theory.

The Principle of Le Chatelier. This is one of the most important generalizations in natural science. It depends on the Second Law of Thermodynamics and so is universal in its application. It may be stated thus: when a factor determining the equilibrium of a system is altered, the system readjusts itself to oppose and annul the alteration in the factor. For example, consider the case of a gas occupying a certain volume at a given pressure and temperature. Suppose the pressure is increased. The volume is therefore decreased. By Le Chatelier's principle, the system should do something to oppose this volume decrease. It does so by rising in temperature, for a rise in temperature tends to increase the volume, that is, to oppose the decrease in volume. This principle governs, therefore, the reactions of all sorts of systems to a change in equilibrium.

The Van't Hoff Isochore. This is simply the application of the Le Chatelier principle to the change of equilibrium constant with the temperature. It states that the rate of change of this constant in relation to the change in the temperature is the decrease in total energy divided by the gas constant multiplied by the square of the temperature. This equation is of fundamental importance in studying the equilibrium conditions at widely differing temperatures.

Nernst's Distribution Law. This law governs the distribution of a substance between two immiscible solvents. It states that the ratios of the concentrations in the two solvents will always be the same. That is, if a greater or smaller amount of solute be added, it will always distribute itself between the two phases, so that the constant ratio be maintained. This refers only to the molecular species, as ionization of most substances occurs markedly only in the water phase. In this way, the molecular and ionized species of electrolytes can be distinguished.

Chemical Affinity. This is measured by the maximum external work done by the system in passing from the first uncombined state to the final combined state. Van't Hoff has shown this to be equal to the logarithm of the equilibrium constant multiplied by the absolute temperature by the gas constant. This mathematical expression enables us to calculate the affinity of anhydrous salts for water of crystallization, the affinity of oxygen for metals, or the affinity of carbon dioxide for lime.

Nernst's Heat Theorem. This important generalization has come to be called the third law of thermodynamics. In time it will come to have as important a bearing on chemical equilibrium as the first and second laws. Nernst made the assumption that at the absolute zero and for short distances above it, the change in free energy, dA , is equal to the change in heat evolved, dU . If this be true, Nernst showed that the following equation was true:

$$A = U_0 - \beta T^2 \frac{\gamma}{2} T^3 \dots$$

A is the free energy of the reaction, U_0 is the heat evolved when the reaction occurs at absolute zero, and T is the absolute temperature. β , γ , etc., are appropriate constants varying for

each system. This can be generally condensed to the simplest form: $\Delta = U_0 - \beta T^2$. This equation can be used to calculate the transition temperatures of allotropic elements, the temperatures of fusion of single substances, etc. Haber made extensive use of it in his study of the reactions between molecular hydrogen and molecular nitrogen to form ammonia. Thus we see the marriage of the most abstruse mathematical reasoning with the fundamental experiments in chemical syntheses which has become more and more the symbol of modern scientific research.

CHEMIN DES DAMES. See WAR IN EUROPE, *Western Front*.

CHENEY, SHELDON WARREN (1886-). An American author born at Berkeley, Cal., who founded the *Theatre Arts Magazine* in 1916 and edited it until 1921. He was associated with the Equity Players, 1922-23. His most important recent books on the theatre include *The New Movement in the Theatre* (1914), *The Art Theatre* (1917), *The Open Air Theatre* (1918), *Modern Art and the Theatre* (1921), and *A Primer of Modern Art* (1923).

CHENOWETH, CATHERINE RICHARDSON (?-). An American philanthropical worker, born in New York. She was privately educated in France and for many years traveled in Europe, studying its history and people. She founded the Society of the Daughters of Holland Dames, and was a member of the Red Cross Society and a delegate to many international meetings and conferences. She was a member of the Commission on Training Camp Activities of the War and Navy Departments in 1917, and was a delegate to the Eugenic Congress in 1921.

CHEBAU, GASTON (1872-). A French writer, born at Niort (Deux-Sèvres), France. He is the author of realistic novels in the manner of Flaubert, but his treatment, while characterized by the same minute observation, is less convincing than that of his model. His works have the atmosphere of Vendée. In *Champi-Tortu* (1906), he attempted a novel of childhood, but succeeded less well than some of his contemporaries in creating a type. His works include: *Les Grandes époques de M. Thébault, Essai de psychologie bourgeoise I* (1902); *La Saison balnéaire de M. Thébault, Essai de psychologie bourgeoise II* (1902, 1919); *Monseigneur voyage* (1903, 1910); *Le Part du feu* (1909); *La Prison de verre* (1911, 1912); *Le Monstre* (1913); *L'Oiseau de proie* (1913); *Le Remous* (sequel to the preceding novel, 1914).

CHERRY, CHARLES (1874-). An actor born in Greenwich, Kent, England. He made his début at 18 and played for several years in England with John Hare, then in the United States with Henrietta Crossman, Elsie de Wolfe and Mary Mannering and for five years with Maxine Elliott. He starred in: *The Bachelor*; *The Spitfire*; *The Seven Sisters*; *Thy Neighbor's Wife*; *Scandal* (1920-21); *The Tyranny of Love* (1921).

CHESAPEAKE AND DELAWARE CANAL. See CANALS.

CHESS. See SPORTS.

CHESTER, COLBY MITCHELL (1844-). An American naval officer (see VOL. V). In 1917, he became professor of naval science at Yale University, and was superintendent of the naval units of Yale and Brown Universities un-

til April, 1919. He was president of the Inter-Ocean Engineering Company and negotiated concessions for the construction of railroads and the development of mines and oil wells in Turkey. See CHESTER CONCESSION.

CHESTER, GEORGE RANDOLPH (1869-1924). An American writer (see VOL. V). In collaboration with his wife, Lillian De Rimo Chester, he wrote: *The Ball of Fire* (1914); *Cordelia Blossom* (1914); *Runaway June* (1915); *The Enemy* (1915); and a dramatization of *Cordelia Blossom* (1914). He was a frequent contributor to the *Saturday Evening Post*.

CHESTER CONCESSION. A concession for the construction of 2800 miles of railways, and for the exploitation of mineral resources in Anatolia, granted to an American syndicate, the Ottoman-American Development Company, headed by Rear-Admiral Colby M. Chester (retired) (q.v.) on Apr. 10, 1923, by the Angora (Turkish) government. The railroad grant applied to an extension of the old Anatolian Railway from Angora to Sivas, with a branch to the port of Samsun on the Black Sea; a line from Sivas to Erzerum and thence on to the Persian and Russian frontiers, with branches to the Black Sea ports of Tireboli and Trebizond; a line from Oulu Kishla on the Bagdad Railway to Sivas via Kaisarieh; a trans-Armenian railway from Sivas to Kharpout and thence to Mosul with branches to Bitlis and Van; and a railway from Kharpout to Youmourtalik, a port on the Gulf of Alexandretta. As an inducement toward the carrying out of the work, the American promoters were granted the right to exploit all the mineral resources, including oil, lying within a 20-kilometer zone on each side of the railway lines, as well as the privilege of carrying on such subsidiary activities as the laying of pipe lines, the utilization of water power for construction, and the building of port and terminal facilities on the Black Sea and the Gulf of Alexandretta. The Company might utilize the resources of the public lands, including sand pits, gravel pits, quarries, and timber, without compensation and was granted exemption from taxation. Economically, the concession meant the right to exploit some of the richest oil fields in the world—those of Erzerum, Bitlis, Van, and Mosul—and the development of the mineral resources of Armenia. It was an award of the first importance and marked the introduction of American capital for the first time on a large scale into the Near East. Whether it was to have political implications, as did the Bagdad Railway concession (q.v.), it was too early to say, though it is significant that the French Foreign Office, on behalf of its nationals with whose claims the Chester grant conflicted, despatched a note to the Angora government in which it characterized the whole procedure as being deliberately unfriendly. Moreover, the oil-exploitation rights in the Mosul district granted to the Chester concern conflicted with the claims of the British-controlled Turkish Petroleum Company. In 1923, the Angora Assembly abruptly declared that the concession had lapsed, owing to failure of the concessionaires to fulfill in the allotted time certain conditions of the grant; but Mr. Clayton Kennedy, as the representative of the syndicate, went to Angora in person and, it was reported in 1924, succeeded in reopening the question. It was estimated by promoters that \$300,000,000 would be needed to

carry the plan through, and, while it might involve some risks for the capital invested, the returns, directly and indirectly, would be immeasurable.

CHESTERTON, GILBERT KEITH (1874-). An English author (see VOL. V). He made a lecture tour of the United States in 1921. His works since 1914 include: *The Flying Inn* (1914); *The Wisdom of Father Brown* (1914, 1921); *Poems* (1915); *The Crimes of England* (1915); *A Shilling for My Thoughts* (1916); *A Short History of England* (1917); *Irish Impressions* (1919); *The Superstition of Divorce* (1920); *The New Jerusalem* (1920); *The Uses of Diversity* (1921); *The Evils of Eugenics* (1922); *What I Saw in America* (1922); *The Ballad of St. Barbara, and Other Verses* (1922); *The Man Who Knew too Much, and Other Stories* (1922).

CHESTNUT BLIGHT. See PLANTS, DISEASES OF.

CHEVALIER, ALBERT (1861-). An actor and dramatic author (See VOL. V). In 1916, in London, Mr. Chevalier played Eccles in *Caste*. His best recent characterization was Joe Brown in *My Old Dutch*, a production which he wrote with Arthur Shirley in 1916 and with which he toured repeatedly, from 1916 to 1920. He also wrote a book of reminiscences, *Before I Forget*.

CHEVRILLON, ANDRÉ (1864-). A French writer, a nephew of Taine, who chose England and the Orient as objects of study. He was born at Ruelle (Charente), and educated at the University College School (London), the Ecole Alsacienne (Paris), the Lycée Louis-le-Grand, and the University of Paris. He was professor of English at the École Navale of Brest in 1887-88, and from 1889 to 1894 was *maître de conférences* at the Faculty of Letters of the University of Lille. He was with the British army at the front during the War, and afterward (1921) was received in the French Academy. His writings fall into two distinct classes: impressions of travel, and critical essays on England and English literature. Besides many articles in the *Revue de Paris* and the *Revue des deux mondes* his works include: *Dans l'Inde* (1891); English translation, *Romantic India* (thesis, 1894); *Terres mortes* (1897); *Études anglaises* (1901); *Un Crépuscule d'Islam* (1906); *Nouvelles études anglaises* (1910); *L'Angleterre et la guerre* (1917; English translation, *Britain and the War*, with a preface by Rudyard Kipling); *Près des combattants* (1919); *Marrakech dans les palmes* (1920); *Les Américains à Brest* (1920); *Trois études de littérature anglaise* (Kipling, Shakespeare, Galsworthy) (1921; English translation, 1923).

CHICAGO. The second city of the United States and the railroad centre of the West. The population rose from 2,189,520 in 1910 to 2,701,705 in 1920, an increase of approximately 23 per cent. The negro population of the city increased 155 per cent, from 44,103 in 1910 to 112,536 in 1920. The total population according to the estimate of the Bureau of the Census for 1923 was 2,886,121.

The process of developing the city according to the plan laid out at the beginning of the century continued. In the ten years between 1909 and 1920 twelve major city planning improvements were got under way. The estimated cost

of the improvements totaled \$230,000,000 including bonds voted to the amount of \$61,500,000, and \$8,000,000 of special assessments on property directly benefited and \$162,000,000 to be provided by the railroads for electrification and the improvement of the terminals. The Roosevelt Road improvement was completed from Ashland Avenue to Michigan Avenue; the street was widened for two miles of its length from 66 to 108 feet, at a total cost of \$4,500,000. Michigan Avenue, which was 130 feet wide from Roosevelt Road to Randolph Street, was widened to 130 feet its entire length to the river, and carried on in a straight line via a new drawbridge supplanting the narrow Rush Street bridge, into Lake Shore Drive, north of the river. The Bridge and approaches were built on two levels. The cost of this improvement was \$13,115,558, of which amount about \$8,000,000 was for the bridge. The south shore lake front development was rapidly approaching completion in 1924. It comprised the widening of several south side streets and their extension northward to connect with a projected outer boulevard, and the construction of an enclosed lagoon extending from Grant to Jackson Parks, and an athletic stadium seating 65,000 south of the Field Museum. South Water Street, the traditional food and produce market along the river front, was in process of condemnation and vacation, to be converted into a cross-town boulevard from the new Michigan Avenue bridge westward, to be called Wacker Drive in honor of the chairman of the Plan Commission, Charles E. Wacker. Union Station was built in 1923-4 at a cost of \$65,000,000. The rooms actually used for the trains were surmounted by a large office building. The Illinois Central station was under construction in 1924. In 1921 a zoning commission was appointed, headed by the city commissioner of buildings. Two years later the city adopted four classes of use and five of volume districts; the latter type was a combination of the more usual height and area districts. The commission attempted in 1923 to arrange to plan the whole metropolitan area about Chicago, including a number of smaller cities in Illinois and Indiana. A municipal pier was completed in 1916 with a total length of 3000 feet, width of 292 feet, and 8500 feet dockage. At the shore end of the pier is the head house containing the administrative offices. Railroad tracks and warehouses for convenience of shipping, and trolley tracks extended the length of the pier to a large pavilion on the outer end. This building, which is for free public use, contains a dance hall, refectory, children's amusement rooms, lavatories and rest rooms. A great festival hall covers nearly the whole width of the pier. From the pavilion concrete terraces lead down to an open plaza extending to the end of the pier. The year following the completion of the dock it was found to be necessary to protect it from heavy weather on the lake. The city accordingly built a rock-filled pile breakwater 2350 feet long to the south of the pier, and extended the government breakwater that partially sheltered it on the north and east. These jetties not only served to protect the pier, but were so built that they could be used as the dock walls of other piers, and could be extended as required when additional commerce made such action necessary.

The city parks also were extended, increasing from 40 in 1914 to 195 in 1920 and 200 in 1924.

Over 200 acres were added to Lincoln Park on the north, made by filling in the Lake Michigan shore. The project cost \$1,875,000, but the land so made was estimated to be worth fifteen million dollars. It embraced a yacht harbor, lagoon, bathing beaches, picnic grounds, playgrounds and a golf course. In Grant park at the southern end, the Field Natural History Museum was built as the first step in the development of this space as an educational centre. It was built of marble on made land, covered an area 700 by 350 feet, and cost \$6,000,000. The Chicago Zoölogical Park was being organized in 1923 on a 300 acre tract given by Mrs. Edith Rockefeller McCormick, but the voters in 1923 rejected a referendum on a special tax therefor.

In 1920 the city voted to increase the number of city wards from 35 to 50, but to reduce ward representation on the city council from two to one, thus cutting the council membership from 70 to 50.

The foundering of the excursion steamer *Eastland* in 1915 in the Chicago River cost 812 lives. The vessel had been declared unsafe some time before the accident. She lacked stability, and, being overloaded and unevenly ballasted, she snapped the hawsers that held her to the dock and turned over. Most of those killed were imprisoned within the hull.

Rioting that lasted seven days broke out in 1919 between whites and negroes on one of the bathing beaches where the negro section of the city joined the white. Thirty-eight persons were killed, of whom 15 were white and 23 negroes; 537 were injured, of whom 178 were white and 359 negroes. Many houses were burned and a thousand negroes made homeless. CHICAGO, UNIVERSITY OF. A coeducational institution at Chicago, Ill., founded in 1891 largely through gifts of John D. Rockefeller, although additional millions of contributions to its resources had been made after the last of his gifts were received. The enrollment of students began with 744 in the year 1892-93 and increased to 7781 in the year 1914-15. The enrollment for 1922-23 was 12,748. The foregoing enrollment is exclusive of the students in the correspondence study department (6658 in 1921-22), and exclusive also of the pupils enrolled in the laboratory schools of the School of Education. The number of members in the several faculties increased from 274 in 1914-15 to 401 in 1922-23, this number including members of the teaching staff of rank above assistant. The bound volumes in the university libraries increased in number from 458,616 in 1914-15 to 670,749 in 1922-23; in addition, it was estimated that there were available 250,000 pamphlets. The productive funds increased, between the years 1914-15 and 1922-23, from \$19,598,275 to \$32,268,885; and the annual income from \$1,693,814 to \$3,317,762. Mr. Rockefeller's total gifts to the university amounted to

\$34,873,360.90, including that for \$10,000,000 which he designated as his "final gift." Other contributions in buildings and funds for endowment brought the total assets of the university in 1924 to more than \$60,000,000. The trustees had designated \$1,500,000 for the erection of a chapel in accordance with the donor's wishes, but this work was delayed by the War and excessive building costs. The Divinity School received an anonymous gift of \$200,000 in 1916 for buildings, an amount subsequently augmented by \$150,000, the several gifts to be used for a theology building and a chapel. Various medical institutions in Chicago, including two hospitals and organizations intended for medical research, were affiliated with the university after funds to the extent of \$5,300,000 had been secured for enlarging the medical schools of the university. Of this \$5,300,000, \$1,000,000 was contributed to found the Albert Merritt Billings Hospital, for which plans were prepared, as also were plans for the university chapel. In 1918, Mr. LaVerne Noyes deeded property to the university estimated to be worth a million and a half, to constitute the LaVerne Noyes Foundation. The income from this foundation was to be used to pay tuition fees for deserving students who served in the army or navy of the United States in the War, or their descendants. Ernest DeWitt Burton succeeded Harry Pratt Judson as president in 1923.

CHILD, CHARLES MANNING (1869-). An American zoölogist born at Ypsilanti, Mich. He was educated at Wesleyan University (Ph.B. 1890, M. S. 1892), and at the University of Leipzig (Ph.D. 1894). He was assistant in biology at Wesleyan University (1890-92); and assistant in zoology (1895-96), associate (1896-98), instructor (1898-1905), assistant professor (1905-09), associate professor (1909-16), professor (1916-) at the University of Chicago. Besides numerous articles in zoölogical journals he published *Senescence and Rejuvenescence* (1915); *Individuality in Organisms* (1915); *Origin and Development of the Nervous System* (1921).

CHILD, RICHARD WASHBURN (1881-). An American author and diplomat, born at Worcester, Mass., and educated at Harvard University. He was engaged in the practice of law during the period 1906-17. In 1917-18, he was employed in the United States Treasury on problems of war finance. In 1919, he became editor of *Collier's Weekly*. In 1921, he became American Ambassador Extraordinary and Plenipotentiary to Italy. He wrote the following books: *Jim Hands* (1910); *The Man in the Shadow* (1911); *The Blue Wall* (1912); *Potential Russia* (1916); *Vanishing Man* (1919); *Velvet Black* (1920); *The Hands of Nara* (1921).

CHILD LABOR. The most prominent features of the child labor situation in the United States from 1914 to 1924 were the temporary but marked increase in the number of child workers, which reached its peak in 1918, and, the persistent but unsuccessful efforts to bring the matter under Federal control. During the War, the attraction of high wages and the pinch of the high cost of living caused many children to seek employment; at the same time the scarcity of labor and the urgent need of workers had a tendency to weaken the enforcement of restrictive laws. In Connecticut, New Hampshire, and Vermont, for example, provision was

made for the suspension of any labor law, should the need arise; New York and California provided for the shortening of the compulsory school years; in Dallas, Tex., the compulsory clause of the education law was suspended for a time. As a result of the generally weakened restriction and enforcement, irregularity in school attendance was marked, an unusual number of work permits were issued, a tendency to leave school at an earlier age than usual was noticed, and in industry a conspicuous trend backward to the 9-, 10- and 11-hour day was manifested. Although not without its advances in child labor legislation, the period was marked mainly by efforts to prevent suspension of existing laws and to bring the problem under Federal jurisdiction. The economic depression which followed the War gave impetus to a movement back to the schools in the late summer of 1920, and this, together with a systematic propaganda as to the advantages of education, went a long way toward restoring pre-war conditions. In 1922, with the return of better times, and, doubtless in some measure because of the quashing of the Federal Child Labor Tax Law, the number of children taking out their first work permits began to mount again, and strikingly large increases were reported in the first six months of 1923.

Statistics. According to the census figures, there was a considerable decrease between 1910 and 1920, the first in 40 years, not only in the total number of children at work, but also in the numbers employed in each of the principal general occupational groups. As compared with an increase of 15.5 per cent in the child population 10 to 15 years of age, inclusive, the number of children gainfully employed decreased almost half, or 46.7 per cent from 1,990,225 in 1910 to 1,060,858 in 1920. In the proportion, also, of all children of these ages who are gainfully employed, a corresponding decrease was shown, from 18.4 per cent in 1910 to 8.5 per cent in 1920. The decline in both actual numbers and proportion employed is most striking in connection with agricultural pursuits, in which the numbers decreased 54.8 per cent (1,432,428 to 647,309), or from 72 per cent to 61 per cent of the total number of children gainfully employed. Marked decreases are shown also for the mining occupations (60.2 per cent, 18,090 to 7191), domestic service (51.9 per cent—112,157 to 54,006), and manufacturing and mechanical industries (29 per cent, 260,944 to 185,337). In clerical occupations the number employed increased from 71,001 to 80,140 or 12.9 per cent.

According to the interpretation of the Census Bureau, the decrease in the number and proportion of children employed between the two census periods is at least in part due to differences in the time or the method of enumeration. The principal factor in this reduction of child labor reported in 1920 is believed to be the change in census date from spring, April 15 in 1910, to midwinter, January 1 in 1920, which undoubtedly resulted in a smaller number of children being returned by the census enumerators as engaged in farm work and perhaps other seasonal occupations than would have been returned if the census had been taken in April as in 1910. The statistics of employment in the nonagricultural occupations are not, however, influenced by this factor. The decrease of 26 per cent in the number of child workers in these

occupational groups as contrasted with a 20 per cent increase in the total number of persons so employed may therefore safely be attributed to conditions affecting directly and especially the labor of children, chief among which are the enactment or strengthening of legal regulations.

It should be remembered that the census did not report the number of child laborers under 10 years of age, of whom many were known to be at work in agricultural pursuits, street trades, tenement homework, domestic service, and canneries, and that no account is taken of child laborers who do not miss more than half of their school attendance or of those employed only during the summer vacation. Considering these facts and also that the Federal Child Labor Revenue Act, which was in effect in 1920, was afterward annulled, the figure for 1920 was considered as representing an underestimate of the extent of child labor in 1924. It is worth noting that more than one-third of the 1,060,858 child workers in 1920 were under 14, the legal age for factory employment in 45 States. The failure of the State child labor laws to prevent this widespread employment of children was attributed not altogether to low standards but in great part to the numerous exemptions permitted by many of the State laws and to inadequate enforcement of their provisions.

Federal Legislation. A strong argument in favor of Federal restriction of child labor was the need for uniformity of legislation. The disadvantage in industrial competition suffered by those States having restrictive laws was no encouragement to legislation in other States. From 1914 to 1924, efforts to establish Federal control were continuous, if unsuccessful. A bill to this effect introduced in 1914, after passing the House early in 1915, was prevented by the filibuster of the Senator from North Carolina from passing the Senate before adjournment. Early in 1916 the Keating-Owen bill succeeded in passing both houses and became effective Sept. 1, 1917. This law, enacted under the interstate commerce clause, prohibited the shipment in interstate commerce, within 30 days after production, of any goods produced by children under ages specified for certain industries or by children working longer hours than were specified. Its constitutionality was attacked almost immediately in North Carolina, and on appeal to the Supreme Court of the United States it was declared invalid in June, 1918, on the ground that it interfered with the powers reserved to States under the 10th amendment and transcended the power of Congress over interstate commerce. Almost at once another act was passed by Congress, receiving the presidential signature in February, 1919. In an attempt to meet the situation, the law was shifted from the interstate commerce clause to the broad field of taxation, and a 10 per cent tax was imposed on the net profits of any mine or industry in which child labor was employed. It was short-lived in its effect. Before the end of 1919 it had been declared unconstitutional in the courts of North Carolina; in 1922 it was condemned by the Supreme Court of the United States. According to the unanimous opinion of the Supreme Court, the law was invalid, since it attempted to regulate through the taxing power of Congress a matter entirely within the jurisdiction of the various States; and the decision attacked the idea of taxing as a penalty instead of as a means of revenue. In the latter

part of 1923, following memorials to Congress from a number of States, a constitutional amendment was introduced, to permit Federal child labor legislation. The resolution provided for an amendment granting Congress power to limit, regulate and prohibit the labor of persons under 18 years of age; the power of the several States would thus remain unimpaired except that the operation of State laws was to be suspended to the extent necessary to give effect to legislation enacted by Congress. It passed the House in April 1924, and the Senate on June 2, 1924. It was then sent to the several States for ratification. Notwithstanding the delay in securing effective Federal control, the period was marked by progress in the centralization and standardization of efforts toward child labor regulation. The National Child Labor Committee, largely through whose efforts the United States Children's Bureau was established in 1912, did much by its investigations and publicity campaigns to create and encourage public sentiment in favor of restriction, and by its aid to various State commissions in drafting bills, and in constructive measures, made for some uniformity.

State Legislation. Meanwhile, through the legislation of the States, the movement made gradual, though uneven, progress. Child labor legislation in 1914 stood thus: Every State but New Mexico had passed laws relating to child labor or compulsory school attendance; 34 States and the District of Columbia had 14 year age limits for children in factories; 32 States and the District of Columbia prohibited night work for children under 16; 16 States and the District of Columbia limited the working day of children under 16 to 8 hours; night messenger service was regulated by special laws in 17 States; 7 closed it to persons under 18, while California prohibited all night employment for persons under 18; 26 States had strengthened the requirements concerning work permits so that there was reasonable assurance that a child under legal age would not receive one; inspection of child labor had been established and made more efficient in every State but six; certain forms of child labor previously unregulated were recognized as harmful and included in child labor laws, New York laws including tenement home work by children under 14; the age of children in street trades was regulated in 12 States and 8 cities, besides the District of Columbia.

By 1924, 18 of the 48 States had equalled or surpassed the moderate requirements of the Federal Child Labor Tax Law. The National Child Labor Committee thus outlined the general situation in that year: limitation of child labor by requiring an educational qualification was in force in 38 States, although only 30 required the completion of a specified grade, and only 12 required the completion of the 8th grade. In 46 States the minimum working age for boys and girls in factories, also in stores and canneries in many cases, was 14 years or higher; 1 State fixed the limit at 12 for boys and at 14 for girls; 1 State had no age minimum. Night work for children was prohibited under the age of 16 in 38 States; 5 States had a similar law, but with exemptions for certain industries; 1 State prohibited night work for children under 14½; 4 States had no prohibition of night work for children under 16. The maximum working day for children under 16 was limited to 8 hours in 30 States; in 17 States such

minors were permitted to work 9, 10, or 11 hours daily; 1 State did not regulate the working day in any way. Working in mines and quarries was forbidden for children under 16 in 26 States, in 7 States such minors were prohibited from working in mines but not in quarries. In only 10 States were there State-wide laws for street work, although some restriction on street trades was in force in 8 other States. A certain physical requirement for the issuance of regular employment certificates was fixed by law in 30 States, in 22 of which an examination by a physician was compulsory. A new method to discourage evasion of the law was found in providing for double compensation allowances, under the Workmen's Compensation Act, to illegally employed minors when injured. Practically all direct restriction of child labor, however, applied only to factories, stores, and mines. Compulsory school attendance laws were the only means of keeping children out of other wage-earning activities. In 1922, every State had some kind of compulsory attendance law; 2 States required full-time schooling up to 16 for all children; 26 required attendance up to 16 and in some cases to 17 or 18, although usually exempting those over 14 to go to work; and 26 States required employed children, in some States up to 18 years of age, to attend part-time continuation schools. (See EDUCATION IN THE UNITED STATES.)

The employment of children in agricultural occupations was not given much serious consideration until 1918; most State child labor laws, in fact, specifically exempted such work, and usually domestic service also, from their provisions. Investigations carried on after that year, by the National Child Labor Committee, in cotton picking, sugar beet growing, and other forms of commercialized agriculture, revealed that some regulation of age and hours was needed, not only to check loss of schooling but to safeguard children from the heavier kinds of farm work. Nebraska, recognizing this necessity, specifically provided in its child labor law for children working in the beet fields. Another difficulty in the rural situation which was being given serious consideration was the case of children of migratory farm laborers. Such children were beyond the reach of compulsory education laws, either in their home locality or the district where they went to work. California made an attempt to solve the problem in 1921 with a law making it the duty of the State superintendent of education to organize and maintain special classes for the education of children of migratory laborers in rural districts; and in 1924 a survey of the migratory labor situation was in progress in that State. Industrial homework was another phase against which little effective legislation had been directed. In New York in 1923, in 2169 families, 535 children between 10 and 16 were regular workers, 79 per cent of them under 14 and 35 per cent under 10. In the opinion of some, much was to be accomplished by making the employer responsible for such illegal employment of children; others held that the only remedy was complete prohibition of industrial homework.

Other Countries. In Europe the effects of the War on child labor were far greater than in the United States. Great Britain, to meet the situation, passed the Fisher Education Act in

1918, regulating for the first time the employment of children in all gainful occupations, including agriculture and domestic service; prohibiting employment of children under 12; requiring compulsory full-time school attendance up to 14, and compulsory continuation school attendance up to 16. Similar measures were found necessary in the other European countries, where practically all restraints on child labor had been cast aside during the War. Belgium, in 1919, prohibited employment under the age of 13, and under 14 without certificate; fixed a 12-hour day with rest periods; and instituted an advanced programme of medical examinations for industrial workers at least once a year until 18. Russia adopted a 16-year limit for entrance to full-time employment and was developing a complementary educational plan. Poland set a minimum school attendance of seven years. Switzerland placed the minimum age of employment at 14 years and fixed the maximum of daily educational and occupational activity for those under 16 at 10 hours. Various draft conventions adopted at the International Labor Conferences under the League of Nations in 1919, 1920, and 1921 affected children employed in industry, night work for children, children on vessels, and children in agriculture. The convention fixing a minimum age of 14 had been ratified, in 1924 by Czecho-Slovakia, Estonia, Sweden, and Japan. See INTERNATIONAL LABOR OFFICE; LABOR LEGISLATION; LAW, PROGRESS OF, *Police Power*; HOURS OF LABOR.

CHILDREN'S BUREAU. See LABOR ORGANIZATION, INTERNATIONAL.

CHILD WELFARE. In the decade closing with 1924, public interest in the problems of child welfare in the United States was not only increasingly active; it took on an increasingly scientific turn. Only one State had dealt with the health of children through a special bureau in 1912; in 1923 there were child health bureaus in 46 States. The practice of physical and dental examination in the public schools was rapidly spreading. Special bureaus dealing with dependent, neglected, and delinquent children (see JUVENILE COURTS), had been organized in more than half the States by 1923; and about the same number of States had at that time created commissions to make comprehensive inquiries into all aspects of child welfare with a view to recodifying existing laws and determining what improvements were needed to bring the public care of children up to standard. There was a steady growth in such efforts to provide wholesome recreation as the playground movement. The need for special education for the deaf and blind and for the physically and mentally handicapped was coming into general recognition. For dependent children, efforts were widened to obviate neglect and avoid the institutional atmosphere by the creation of systems of mothers' pensions (q.v.), by placing children in private homes under supervision, and in some instances by building institutions on the cottage plan. Characteristic of the general tendency to strike through to the root of social evils with preventive measures was the increased attention given to children of preschool years. Baby clinics and day nurseries to care for the children of working mothers increased in number; finally the preventive theory brought about the establishment of prenatal clinics to decrease infant mortality. (See MATERNITY PROTECTION.) An outstanding development of

the period was the growing realization that it was a duty of the State to protect the interests of children born out of wedlock. The movement advocated confidential records of birth, private proceedings to establish paternity, compulsory financial provision by the father, according to his economic condition; licensing and supervision of child-placing and child-care institutions, assistance to unmarried mothers, making desertion of an illegitimate child an offense, and establishing legal right to the father's name and the right of inheritance after an adjudication or acknowledgment of paternity. By 1924 the majority of the States had given to the child of illegitimate birth practically the status of a child of legitimate birth, with respect to the mother. The full legal relation of father to child had been established only in North Dakota. A uniform State law on illegitimacy, designed, for one thing, to facilitate extradition for offenses of this sort, had been accepted by several States.

In this period was done most of the work of the Children's Bureau of the Department of Labor, which was founded in 1912 and was the first national organization of its kind in any country. It began with an inquiry into the subject of infant mortality, and published reports on its findings and popular bulletins on proper infant and maternal care. Subsequently it carried on research and published much material on such subjects as child labor, juvenile delinquency, and juvenile courts, illegitimacy as a problem in child welfare, and the so-called mothers' pension laws. It also investigated the methods of child care in New Zealand, which had the lowest infant mortality rate of any country. The Bureau was given the administration of the first child labor act, which was in effect nine months before it was declared unconstitutional, and of the maternity and infancy act (See MATERNITY PROTECTION.) From its foundation, it did much work in cooperation with the national women's organizations. In 1916, through the General Federation of Women's Clubs, it inaugurated the National Baby Week campaigns, which expanded in 1918 under the stimulus of the War into the Children's Year. All but two of the States eventually participated in the programme, which reached more than 16,500 cities, towns and villages. A campaign for birth registration was also carried on by the Bureau and the Federation, and by June, 1923, the birth-registration area included 30 States and the District of Columbia and affected 72.2 per cent of the population. See CHILD LABOR and EDUCATION IN THE UNITED STATES.

CHILE. A South American republic extending along the western or Pacific coast from Peru to the southern extremity of the continent. Its area is 292,414 square miles, and its population, by the census of Jan. 1, 1920, 3,754,723. This was a gain of 505,444 over the last official census, that of 1907, or an annual increase of 1.2 per cent. The populations of the principal towns (1920 census) were Santiago, the capital, 507,296; Valparaiso, 182,422; Concepcion, 64,074; Iquique, 37,421; Talcahuano, 36,079; Chillan, 30,831; Antofagasta, 51,531. The movement of population continued toward the cities in 1920; 46.6 per cent was urban as compared with 38.6 per cent in 1895 and 43.3 per cent in 1907.

Agriculture. In 1922 the divisions of agri-

cultural land comprised land capable of cultivation or suitable for grazing, 51.1 per cent, outside of the Territory of Magallanes; natural forests, 23.9 per cent; waste land, 13 per cent; land capable of irrigation, 5 per cent; natural pastures in the Territory of Magallanes, 7 per cent. Cereal culture and the vine continued to engage the greatest attention. The following table indicates the tendency of the period. The

producing association were features of this trade. More than 3,000,000 tons accumulated with no buyers. The ensuing depression affected the whole country because of Chile's dependence on its nitrate trade. Chilean pesos dropped from 3 to the dollar to 11; more than four-fifths of the nitrate plants closed, and hard times were universal, so that the government was compelled to resort to unemployment doles. The market

Principal Crops	Area in Acres 1922-23	Production in Metric Tons			Exports in Metric Tons 1922
		1913	1921	1922	
Wheat	1,235,233	641,604	631,131	643,279	1,901
Alfalfa (1921)	134,303	332,492	332,345		
Beans	109,478	42,200	46,110	46,977	10,172
Potatoes	80,252	238,224	311,174	315,362	854
Oats	75,133	64,489	45,800	45,995	13,967
Corn	70,315	41,835	42,799	45,134	438

production of wine was 1,647,503 hectoliters in 1921 as compared with 1,345,979 in 1911. The possibility of reaching the American market during the winter for fruits and vegetables led to a growing interest in horticulture and gardening after the War. The trend toward intensive agriculture manifested itself in the increase in dairy farming, though production by 1923 did not yet suffice for local wants. In 1919 livestock included 391,718 horses, 36,489 asses, 51,411 mules, 2,163,141 cattle, 4,500,190 sheep, 459,606 goats, and 292,431 pigs. These showed little change from the figures of 1912. The wool clip in 1919 amounted to 16,937 metric tons, and in 1921-22 it was 10,000 metric tons. The two subsequent years showed a recovery.

Mining. In spite of the importance of agriculture, mining is the greatest source of the country's economic wealth. The copper industry increased in recent years, Chile advancing to the place of the world's second largest producer. Iron ore deposits, placed at 1,000,000,000 tons, were found in the departments of Atacama and

did not recover until the producers yielded to necessity in 1922-23, and cut prices materially. The year ending June 30, 1923, saw the sale of 2,000,000 tons of nitrate, and the year 1923-24, according to early forecasts, showed even larger sales. In the calendar year 1922, total mineral products exported were valued at \$103,052,760 dollars, a decline of \$21,000,000 from the 1911 figures.

Manufacturing. In 1920 Chile had 2975 manufacturing establishments using raw materials to the value of 589,823,090 paper pesos; 72,713 workmen were employed. Goods valued at 993,220,108 paper pesos were produced. Leading manufactured products were food supplies, gas and electric power, textiles, leather, furs, clothing, chemicals, paper, metal goods, alcohol, lumber, and tobacco. In 1920-21 German capital was active once more, and German shipping became important, woolen mills, flour mills, and railway shops and other industrial establishments increasing in the southern districts around Concepcion, Penco and Valdivia.

Country	IMPORTS		EXPORTS	
	1913	1922	1913	1922
United States	\$20,089,159	\$23,194,885	\$30,413,385	\$45,027,410
Belgium	5,671,426	3,776,706	5,674,669	2,372,770
Germany	29,578,138	13,079,429	30,772,742	7,994,210
Great Britain	36,109,210	20,825,212	55,548,341	14,264,860
France	6,623,260	4,333,130	8,847,885	4,296,770
Others	22,202,808	23,361,913	11,144,575	47,081,480
Total	\$120,274,001	\$86,571,275	\$142,801,577	\$121,037,500

Coquimbo. Besides, there were mines for gold, silver, cobalt, manganese, coal, salt, borax, sulphur, and other minerals. Nitrate of soda with its by-product, iodine, remained the most important single mineral product and the chief article of commerce; its production steadily absorbed large blocks of capital. The following table indicates the production and export of nitrate for certain years.

Year	Production in Metric Tons	Export in Metric Tons
1910	2,465,415	2,335,941
1915	1,755,291	2,023,294
1918	2,859,303	2,919,177
1919	1,703,240	803,961
1921	1,311,036	1,193,062
1923	1,903,527	2,257,158

A break in the nitrate market followed in 1921 and 1922 as a result of the fall of the farmers' purchasing power the world over. The manipulations of a European buyers' pool and a

Commerce. Up to 1920, Chilean commerce showed steady advancement except in 1915 and 1916, but the depression that set in with 1920 brought the trade record for 1922 below the pre-war level. Imports for 1913, 1920, and 1922 were worth \$120,274,001, \$166,103,810, and \$86,571,275; exports for the same years were \$142,801,577, \$284,293,108, and \$121,037,500. The distribution of leading exports in 1922 as compared with 1913 was nitrate, 51 per cent and 77 per cent; and copper, 29 per cent and 2 per cent. Frozen meat, wool, iodine, and truck produce represented from 1½ to 3 per cent of the outgoing shipments in 1922. Textiles accounted for 18.6 per cent of 1922 imports as against 16.7 per cent in 1913; machinery 11.3 per cent as against 7.4 per cent; petroleum, 6.6 per cent as against 5.4 per cent in 1913. Imports which showed a heavy drop from 1913 to 1922 were coal, lumber, automobiles, and cement. The accompanying table indicates the distribution of the trade by countries for 1913 and 1922.

The United States steadily forged to the front in Chilean trade during the War and was able to maintain its leading position afterward. In 1918 Chilean exports to the United States equalled the combined values of all other countries, while imports from the United States into Chile accounted for 46.6 per cent of the total. In 1922 American imports into Chile were 26 per cent of the total, as compared with 16 per cent in 1913. Exports to the United States were 36.6 per cent in 1922 and 21.3 per cent in 1913. Thus Great Britain was completely supplanted. The maintenance of cordial commercial relations between Chile and the United States was due to the expansion of shipping facilities, the local establishment of American banks and credit information companies, investments in Chilean mines and industries, and the completion of direct cable service. Shipping in 1922 was far below the pre-war level but improved materially in 1923. Foreign vessels and tonnage entering Chilean ports in 1911 were 14,698 vessels, of 26,164,068 tons, and in 1922, 14,670 vessels, of 14,525,761 tons. By the law of 1922, coastwise trade was confined to ships of Chilean registry. In 1912, six American ships of 9000 tons entered Chilean ports; by 1921 the figure was 455 ships of 1,250,000 tons.

Communications. In 1922 there were 5288 miles of railway, 2837 of them state owned, as compared with 2740 in 1911, with 1418 state owned. In 1921 work was begun on electrification of the line between Santiago and Valparaíso and that between Llay-Llay and Los Andes, 233 miles in all; this was to be completed in 1924. Though agitation was carried on for construction of the Chilean section of the Antofagasta (Chile)-Salta (Argentina) railroad, no headway was made; this was due to a feeling prevalent in Chile that Argentina would receive most of the benefit from the line. The projected railway is 350 miles, 200 miles of which lie in Chile. A railway loan of £5,000,000 was floated in New York in 1921, and of the money spent, at least 90 per cent went to American manufacturers.

Finance. The budget for 1922 provided for the collection of 82,487,000 gold pesos and 319,209,781 paper pesos in revenue. The 1912 figures were 101,050,000 gold pesos and 189,200,000 paper pesos. Expenditures in the 1924 budget totaled 72,305,161 gold pesos and 366,193,673 paper pesos; in 1912, expenditures according to the budget were 81,070,966 gold and 280,894,118 paper pesos. In June, 1924, President Alessandri declared that budget deficits carried since 1920 totaled 160,000,000 pesos. The public debt on Dec 31, 1922, included an internal debt of 154,714,000 gold pesos and 250,841,691 paper pesos; external debt made up of £28,672,352 sterling and guarantees amounting to £5,797,154, \$33,141,694 and guarantees of \$26,338,306, and guarantees amounting to 35,378,000 paper pesos. The paper peso in 1914 was worth, on an average, 5.50 to the dollar, and in 1918, 3.47; but in 1921 the industrial depression lowered it to 8.29; in 1922 it was 8.41; and the average for 1923 was 8.22, notwithstanding improved economic conditions.

Education. Primary education was made compulsory in 1920, but the figures for 1923 show no great change from 1911. In the later year primary schools numbered 3099 (2896 in 1911); enrolled pupils 369,423 in July, 1923 (375,274 in 1911); and teachers, 9162 in 1920

(4829 in 1911). In 1921, 52,880 pupils were in secondary schools (20,329 in 1911). Two new universities were opened in 1920, the Industrial University at Valparaíso and the University of Concepción. Agricultural and vocational education received increasing attention.

History. The known sympathies of a considerable element of the Chilean population for Germany in the War, through family, intellectual, and commercial ties, did not interfere with the neutrality which it maintained throughout. The falling off of trade immediately following the outbreak of the War caused serious unrest, but affairs improved when Chile began to play a prominent part in furnishing the Allies with war materials. In 1918 this intercourse reached its peak, with wide-spread prosperity. In 1919, exports fell to half their former volume but were completely restored in 1920. Not until the world-wide depression of the next year did trade once more languish, to the accompaniment of labor troubles and disorders.

The end of the administration of Juan Luis Sanfuentes (1915-20), Conservative coalition leader, marked an election campaign which revealed how widely liberal tendencies had spread. The campaign was fought between Arturo Alessandri, candidate of the Liberal Alliance, a bloc of middle-class and working men's parties, and Luis Barros-Borgoño, the representative of the governing bureaucracy. The returns gave Alessandri 179 electoral votes to Barros-Borgoño's 175, but as a result of several contests, the election was thrown into the Congress. Because of the excited state of public opinion it was decided to constitute a Court of Honor, which after months of deliberation found for Alessandri on Oct. 4, 1920, an electoral vote of 177 to 176. Congress accepted the decision and declared Alessandri president. He was committed to a reform programme that included administrative decentralization, qualified woman suffrage, separation of church and state, an income tax, a labor code, and state control of the nitrate industry. President Alessandri, never in sympathy with the groups controlling the Congress, came into open conflict with the Conservative Senate late in 1923. His legislative programme had aroused dissent to such a degree that funds were denied the government, with the result that the cabinet had to resign. A new cabinet, constituted on Jan. 3, 1924, fared no better than its predecessor, and to still the political bickering which threatened political turmoil, President Alessandri dissolved the Congress on Jan. 7. The character of the constitution succeeded in bridging over a bad situation, for by the Commission of Safety, empowered by the fundamental law, to sit during the adjournments of Congress, a compromise was effected which brought the two parties together again. President Alessandri, on his side, accepted a limitation of his power to suspend Congress, while the Senate consented to incorporate the president's demands for reform in the constitution as amendments. Chilean politicians and publicists hailed the settlement of the crisis as containing the elements of a pacific revolution. On February 9 the Senate passed the President's programme. It contained laws for an income tax, for the right to expend sums based on the previous year's budget in the event of the Congress's failure to pass a budget for the year, and for the restriction of votes of confidence to the lower house. Congressional elec-

tions in March, 1924, upheld the president's liberal policies, so that the Congress, assembled on June 1, held government majorities in both houses for the first time in the President's administration.

Chile's rôle in South American affairs during 1914-24 was stormy. The dispute over the Tacna-Arica provinces (q.v.) with Peru, which in 1913 was in abeyance, flared up once more in 1919. The secret attempt of Chile to gain the sympathies of Bolivia by offering her an outlet to the sea, which was divulged in 1919, once more set at work the hatreds that had been smoldering since the making of the treaty of Ancon in 1884. The impasse in which negotiations of 1920 and 1921 ended resulted in an attempt, first, to have the Assembly of the League of Nations adjudicate the matter, and then the President of the United States. The point involved was the holding of a plebiscite in the two obscure provinces of Tacna and Arica, which have no economic importance with their area of only 26,036 square miles and population of 39,000. Finally, on July 15, 1922, as a result of the intercession of the United States, both governments consented to accept the American president as arbitrator. On Nov. 30, 1922, after a stormy debate in which the Chilean lower house by a two-thirds majority was compelled to override the veto of the upper house, the protocol of July 15 was ratified. Chilean representatives were appointed in November, 1923. Thus after a lapse of 38 years it appeared that friendly relations between Peru and Chile were once again to be reestablished. (See TACNA-ARICA DISPUTE.) The failure of the 1923 Pan-American Conference (q.v.) to cope with the problem of disarmament caused much disquietude in the country, for Chile was spending on an average 22 per cent of her budget on defense, and even such large sums fell below the costs of the Argentine and Brazilian military and naval establishments. As for international affairs, it should be recorded that Chile assumed an honorable part. In 1919, at the request of the Council, she joined the League of Nations and had the pleasure of seeing Augustin Edwards, Chilean minister to London, elected president of the third League Assembly in 1922. See also NAVIES OF THE WORLD.

CHINA. China proper consists of the 18 provinces, about 2,000,000 square miles in area, Chihli, Shansi, Shantung, Kansu, Shensi, Honan, Anhwei, Kiangsu, Chekiang, Kiangsi, Hupeh, Szechwan, Kweichow, Hunan, Fukien, Kwantung, Kwangsi, and Yunnan; and the dependencies of Manchuria, Mongolia, Sinkiang (Chinese Turkestan), and Tibet (q.v.)—a total area of 4,278,352 square miles. The exact population was unknown; estimates varied from 325,000,000 to 430,000,000. China, therefore, had a density of population of from 80 to 100 per square mile and about 175 for China proper; Shantung had 528 to the square mile, and Kansu 40. Six-sevenths of China's population, however, lived on one-third of its area and was concentrated generally along the coasts and in the huge delta plains of the three great rivers, the Yellow in the north, the Yangtze in the centre and the West River in the south.

Agriculture. No statistics of production in China were available. The only reliable clue to production was the surplus exported and regularly recorded by the Maritime Customs,

under foreign control. The following estimates of China's production of chief crops was based on observation by reliable authorities: silk, 100,000,000 pounds; rice, 600,000,000 bushels; wheat, 200,000,000 bushels; soya beans, 150,000,000 bushels, 70 per cent Manchurian; Han cotton, 2,200,000 bales; Kaohang corn, 200,000,000 bushels; maize, 100,000,000 bushels; millet, 100,000,000 bushels; peanuts, 200,000 tons. Soya beans and raw cotton showed remarkable increases following 1913. Other crops remained the same.

Exports. Silk. In 1922 China exported 44,997,064 pounds of silk, a decline from 46,917,864 pounds in 1913, due to inept reeling of raw white silk not adapted to United States machines; 12,440,000 pounds of waste silk against 15,581,333 pounds in 1913, due to diseased worms. 11,214,066 pounds of filature silk, an increase over 9,112,266 pounds in 1913; 5,023,600 bushels of refuse cocoons compared with 3,473,200 in 1913; 4,276,933 pounds of cocoons against 3,395,866 pounds in 1913, 3,165,466 pounds of wild silk compared with 3,954,933 pounds in 1913; 2,709,733 pounds of yellow silk, a slight increase over 2,510,933 pounds in 1913; 2,356,800 pounds of pongees against 2,233,200 pounds in 1913; 2,040,533 pounds of raw white silk, a serious decline from 4,289,333 pounds in 1913; and 1,769,333 pounds of silk piece goods, a decrease from 2,366,800 pounds in 1913. More than half the white silk in 1922 went to Hongkong, where it was transshipped to Europe and America; one-sixth to France, one-sixth to the United States and one-twentieth to Great Britain. In 1914 one-half went to Hongkong, one-fourth to United States, one-sixth to France and one-thirtieth to Great Britain. Over half the raw yellow silk went to India in 1922 against two-thirds in 1913, France taking one-fourth in 1922 and one-tenth in 1913. Japan took over half the raw wild silk in 1922 and one-fourth in 1913, and the United States one-fourth in 1922, the same as 1913.

Beans, Oils, and Seeds. In 1922 China exported 33,071,471 bushels of yellow and other soya beans, 33 per cent more than in 1921 and 50 per cent more than the 22,946,566 bushels of 1913. 178,199,466 pounds of peanuts were sent abroad in 1922, which was 14 per cent less than in 1921 but 17 per cent more than the 153,798,000 pounds of 1913. Other 1922 exports of oil seeds included sesamum, 167,702,133 pounds (1913, 271,286,000 pounds); rape seed, 81,703,133 pounds (1913, 82,236,000 pounds); linseed, 74,637,600 pounds (1913, none recorded); cottonseed, 43,291,066 pounds (1913, 24,332,000 pounds). In addition to these, China exported 197,359,486 pounds of bean oil, three times the 1913 exports; 99,408,666 pounds of wood oil from the fruit of the Aleurtes tree; and 51,135,100 pounds of peanut oil.

Foodstuffs. In 1922 China exported only 2,537,809 bushels of wheat, less than one-quarter the 1921 shipments against 4,106,800 bushels in 1913; 5,851,723 bushels of bran, two and one-half times 1913 exports of 2,233,000 bushels; 403,575 barrels of wheat flour, one-third of 1921 exports (none recorded in 1913); 57,641,866 pounds of egg albumen and yolk, about the same as 1921 and nearly three times 1913 exports of 20,796,400 pounds; 98,498,334 dozen fresh and preserved eggs, about same as 1921 and three times the 1913 exports of 30,266,833

dozen; 36,812,933 pounds of frozen eggs, three times the 1921 exports (none recorded in 1913); 26,640,800 pounds of fresh and frozen meats, one-quarter less than 1921 and slightly more than 1913 exports of 24,431,466 pounds; 1,798,133 pounds of preserved and prepared meats, one-quarter less than 1921 and considerably less than 1913 exports of 14,603,066 pounds; 1,999,200 pounds of poultry and game, one-fifth greater than 1921 and two-thirds the 1913 exports of 3,265,066 pounds; 23,350,533 pounds of fresh fruits and nuts, one-fifth less than 1921 compared with the 73,173,733 pounds for 1913; 13,368,533 pounds of dried fruits and nuts, one-quarter less than 1921 and one-third the 1913 exports of 30,034,400 pounds; 31,609 tons of sugar, one-third less than 1921 and four times the 1913 exports of 8400 tons, 37,731,733 pounds of green tea, 5 per cent greater than 1921 but only 2 per cent greater than 1913 exports of 36,979,066 pounds, 35,605,200 pounds of black tea, double the 1921 shipments and half the 1913 exports of 73,027,733 pounds; 2,666,933 pounds of black brick tea, 50 per cent greater than 1921 but greatly less than the 1913 exports of 57,442,533 pounds, on account of the loss of the Russian market; 228,533 pounds of green brick tea, only one-seventh the 1921 figures and a tremendous decline from the 1913 export of 23,360,133 pounds, for the same reason; 348,256 pounds of tea dust and tea tablets, 14 times the 1921 figures but less than a quarter of the 1913 exports of 1,471,733 pounds; 12,552 tons of fish and fishery products, slightly greater than 1921 and a little less than the 14,058 tons exported in 1913; 3,742,552 poultry, slightly less than 1921 (2,779,543 in 1913).

Fibres. In 1922 China shipped abroad 112,268,000 pounds of raw cotton, over one-third more than 1921 (1913, 98,505,300 pounds); 8,621,866 pounds of nankeens or cotton cloth, one-fifth less than 1921 (6,407,466 pounds in 1913); 5,168,000 pounds of cotton yarn, 50 per cent greater than 1921 (none recorded in 1913); 8,077,600 pounds of camel's wool, twice the 1921 figure and half the 1913 exports of 4,400,933 pounds; 2,070,400 pounds of goat's wool, one-fifth less than 1921 and one-third more than 1913 exports of 1,557,866 pounds; 67,679,500 pounds of sheep's wool, 10 per cent greater than 1921 and nearly twice 1913 exports of 37,368,266 pounds; 17,418,666 pounds of hemp (for 1913, 10,788,400 pounds), 24,970,666 pounds of ramie, 22,816,800 pounds in 1913; 5,714,666 pounds of jute, 50 per cent greater than 1921 and one-third 1913 exports of 14,053,866 pounds; 9,045,466 pounds of bristles, nearly twice the 1921 exports (1913, 7,028,667 pounds); 11,615,733 pounds of fowl feathers, 50 per cent greater than 1921 and one-fifth 1913 exports of 54,530,000 pounds; 4,878,000 pounds of grass cloth, one-quarter greater than 1921; and one-half 1913 exports of 2,073,333 pounds; 5,590,666 pounds of hair of all kinds, one-fifth greater than 1921 slightly less than 1913 exports of 6,421,067 pounds; 231,354 rolls of matting, two and one-half times the 1921 exports and slightly more than 1913 exports of 266,231 rolls; 24,907,007 mats, 50 per cent greater than 1921 and a little more than 1913 exports of 21,839,088; 10,607,600 pounds of strawbraid, one-half greater than 1921 and less than the 1913 exports of 13,471,600 pounds, and 10,209,241 rush hats, twice the 1921 figure compared with 6,305,180 in 1913.

Minerals. In 1922 China exported 2,377,443 tons of coal, one-third greater than 1921 and 50 per cent more than 1913 exports of 1,489,182 tons; 741,314 tons of iron ore, one-third greater than 1921 and double 1913 exports of 302,010 tons; 224,169 tons of pig iron, one-third greater than 1921, three times 1913 exports of 71,420 tons; 37,600 pounds of quicksilver, one-eighth the 1921 figures (for 1913, 4607 pounds); 15,170 tons of regulus and crude antimony, 10 per cent less than 1921 and a little over 1913 exports of 14,360 tons; 10,111 tons of tin in slabs, one-half greater than 1921 against 1913 exports of 9246 tons; 5621 tons of lead ore, one-fifth less than 1921, compared with 1913 exports of 4481 tons. In 1913 China exported 10,524 tons of zinc ore, but by 1922 the export was negligible.

Hides and Skins. China exported in 1922 32,009,200 pounds of buffalo and cow hides; one-seventh greater than 1921 and one-half 1913 exports of 66,405,066 pounds; 9,308,136 untanned goat skins, one-third greater than 1921 and greater than 1913 exports of 7,153,693; 1,340,535 pounds of horse, ass, and mule hides, one-third less than 1921 and a little less than 1913 exports of 1,517,866 pounds; 111,794 sheepskins, three times the 1921 figures and one-fifth the 1913 exports of 552,425; 937,533 tanned dressed goat skins, twice 1921 and one-third greater than 639,992 exported in 1913; 730,784 dressed lamb skins, one-fifth greater than 1921 and 50 per cent more than 1913 exports of 587,151; 557,650 dog skins made up as clothing, mats, or rugs, twice the 1921 figure and the same as 1913 exports of 591,118; 456,076 goat skins made up as clothing, mats, or rugs, three times the 1921 number and a little more than 1913 exports of 329,298; 143,551 kidskins made up as clothing, 50 per cent greater than 1921 and two-thirds greater than 1913 exports of 93,483; 68,533 lambskins made up as clothing, double 1921 and same as 1913; 42,633 sheepskins made up as clothing, mats, or rugs, eight times 1921 and same as 1913; 2,288,022 marmot skins, dressed and undressed, twice 1921 and ten times 1913 exports of 279,264; 814,539 weasel skins, one-fifth less than 1921 (1,033,582 in 1913); 77,947 fox skins, three-quarters larger than 1921 (107,069 in 1913); 77,603 raccoon skins, eight times 1921 exports and one-third 1913 exports of 226,787; 2,343,066 pounds of leather, one-third the 1921 output, compared with 2,468,533 pounds in 1913.

Miscellaneous. Other leading exports from China in 1922 were 342,947 cattle, sheep, goats and pigs, one-fifth less than 1921 but greater than 1913 exports of 318,681; 112,331,253 square feet of softwood, one-quarter greater than 1921 (1913 not specified); 548,143 cubic feet of hardwood, slightly more than 1921 (1913 not specified); 38,070,933 pounds of paper, slightly less than 1921 but more than the 33,263,333 pounds exported in 1913; 3,435,733 pounds of animal tallow, one-third the 1921 amount and one-fifth the 1913 exports of 16,370,800 pounds; 8,540,800 pounds of vegetable tallow, same as 1921 but less than one-third the 1913 exports of 29,466,400 pounds; 33,645,233 pounds of leaf and prepared tobacco, 10 per cent less than 1921, 66 per cent greater than 1913 exports of 20,268,533 pounds; 8,103,600 pounds of cigarettes, one-fifth less than 1921 but nine times 1913 exports of 992,933 pounds; 2,370,266 pounds of varnish, slightly less than

1921 but 50 per cent more than 1913 exports of 1,790,933 pounds; 34,964 ounces of musk, 10 per cent greater than 1921 and 30 per cent greater than 1913 exports of 28,800 ounces; \$2,459,698 in chinaware, 33 per cent less than 1921 (1913 not specified); \$3,016,167 in fire-crackers and fireworks, 10 per cent over 1921 30 per cent more than 1913 exports of \$2,332,766 9,315,600 pounds of gail nuts, three times 1921 exports and one-quarter more than 1913 exports of 7,419,333 pounds; 12,600,800 pounds of ginger, one-third greater than 1921 and 50 per cent greater than 1913 exports of 8,469,733 pounds; 1,603,733 pounds of glass handles, same as 1921, compared with 1,752,533 pounds in 1913.

Foreign Trade. Total exports for 1913 were \$299,051,963; 1922, \$536,814,917; 26 per cent to Hongkong (for transshipment), 24 per cent to Japan, 15 per cent to the United States, 6 per cent to France, 6 per cent to Russia, 6 per cent to Great Britain; 2 per cent to Singapore (for transshipment), 2 per cent to India, and the rest to the Dutch East Indies, Germany, Italy, Netherlands, and other less important countries.

Total imports for 1913 were valued at \$422,775,535; 1922, \$799,235,520; 25 per cent from Hongkong, 24 per cent from Japan, 17 per cent from the United States, 14 per cent from the United Kingdom, 4 per cent from India, 3 per cent from Germany, 1 per cent each from Russia, Dutch East Indies, Belgium, Macao, Netherlands and Singapore, and less amounts from other countries.

Chief Imports, 1913 and 1922. Raw cotton, 237,514,733 pounds in 1922—17,767,333 pounds 1913: notwithstanding rapid increase of China's cotton crop to approximately 2,200,000 bales in 1922 the spinning industry has increased even more rapidly; cotton yarn, 162,697,333 pounds, 1922—358,048,299 pounds 1913 due to rapid increase in Chinese spindles, 3,055,999 in 1922; gray shirtings, 3,276,425 pieces in 1922 and 5,209,441 pieces in 1913; white shirtings, 3,580,977 pieces in 1922 and 4,537,900 pieces 1913 plain fast black Italians, Ventians and Lastings, 1,410,830 pieces in 1922, none in 1913; colored ditto, 2,983,775 pieces in 1922 none in 1913; figured ditto, 639,455 pieces in 1922, none in 1913; 2,490,088 pieces jeans, in 1922 and 1,720,868 pieces in 1913; 2,121,431 pieces plain prints in 1922, none in 1913; 1,356,699 pieces sheeting in 1922 and 5,209,041 pieces in 1913 Machinery and fittings, \$40,512,380 in 1922 and \$5,136,000 in 1913; 61,923 tons iron bars in 1922 and 39,524 tons in 1913; 48,965 tons rails in 1922 and 19,524 tons in 1913; 20,989 tons galvanized sheets in 1922 and 15,043 tons in 1913; 25,720 tons nails and rivets in 1922 and 21,955 tons in 1913; 33,790 tons sheets and plates in 1922 and 23,852 tons in 1913; 14,726 tons pipes and tubes in 1922 and 4,257 tons in 1913, 40,469 tons of plate cuttings in 1922 and 23,984 tons in 1913; \$7,592,054 railway and street cars in 1922 and \$870,297 in 1913; \$3,611,763 locomotives and tenders in 1922 and \$560,330 in 1913; \$630,412 sewing machines in 1922 and \$644,638 in 1913; 22,725 tons of cobbles and wire shorts, 5944 tons of hoops, 8223 tons of nail rods, and 8228 tons of pig and Kentledge imports in 1913, these commodities show no imports for 1922, due to the operation of Chinese steel mills supplying these demands. American kerosene, 175,823,711 gallons

in 1922 and 112,459,925 gallons in 1913; Borneo kerosene, 4,242,242 gallons in 1922 and 23,603,943 gallons in 1913; Sumatra kerosene 18,763,408 gallons in 1922 and 41,915,648 gallons in 1913, all other kerosene 10,363,317 gallons in 1922 and 6,004,536 gallons in 1913; gasoline 4,818,271 gallons in 1922 and 465,577 gallons in 1913. Rice and paddy, 1,277,079 tons in 1922 and 360,903 tons in 1913; brown sugar, 238,700,800 pounds in 1922 and 303,679,067 pounds in 1913, white sugar, 225,778,666 pounds in 1922 and 237,742,267 pounds in 1913; refined sugar, 519,796,533 pounds in 1922 and 350,387,600 pounds in 1913; confectioners' sugar, 37,698,533 pounds in 1922 and 36,421,467 pounds in 1913; condensed milk, 73,116 dozen in 1922 and 483,720 dozen in 1913; flour, 2,449,636 barrels in 1922 and 1,766,500 barrels in 1913; fish and fishery products \$13,855,284 in 1922 and \$9,458,440 in 1913, dried fruits, \$1,154,697 in 1922 and \$555,635 in 1913, beans and peas 420,093 bushels in 1922 and 820,757 bushels in 1913; butter, 1,421,466 pounds in 1922 and 1,635,467 pounds in 1913; confectionery, \$342,298 in 1922 and \$241,714 in 1913 Aniline dyes, \$5,614,049 in 1922 and \$3,937,927 in 1913; paints and paint oil, \$1,721,542 in 1922 and \$628,935 in 1913; all other dyes, \$13,004,048 in 1922 and \$7,501,424 in 1913; chemical products, \$2,509,968 in 1922 and \$426,313 in 1913; match-making materials, \$2,342,245 in 1922 and \$1,158,541 in 1913; medicines \$5,508,346 in 1922 and \$2,935,591 in 1913; opium, 7280 pounds in 1922 and 2,418,345 pounds in 1913 (due to opium embargo on China); perfumery and cosmetics, \$2,104,385 in 1922 and \$325,392 in 1913; photographic material, \$668,917 in 1922 and \$229,437 in 1913; soap and soap materials, \$2,101,243; in 1922 and \$1,990,565 in 1913; soda, 61,550 tons in 1922 and 32,555 tons in 1913. Cigarettes, 9,837,127 thousand in 1922 and 6,209,037 thousand in 1913; tobacco, 33,871,060 pounds in 1922 and 19,057,466 pounds in 1913; cigars, 32,242 thousand in 1922 and 38,565 thousand in 1913 Leather, 17,890,800 pounds in 1922; and 14,572,666 pounds in 1913; imitation leather, \$194,725 in 1922 and \$143,873 in 1913; leather manufactures, \$97,890 in 1922 and \$277,094 in 1913, belting, \$967,803 in 1922 and \$195,301 in 1913.

Shipping. 114,619,544 tons of shipping entered and cleared from China's ports in 1921, as compared with 93,334,830 tons in 1913. Thirty-six per cent of this 1921 tonnage was British, 27 per cent Japanese and 27 per cent Chinese; 4 per cent American; 1 per cent Dutch; 1 per cent French, and the remainder of 4 per cent variously distributed. Forty-one per cent of this trade moved through Shanghai; 11 per cent through Dairen; 9 per cent through Tientsin; 8 per cent through Canton; 5 per cent through Kowloon; 4 per cent through Hankow, 3 per cent through Tsingtao, 2 per cent through Swatow, and the rest through the remaining 42 treaty ports, in lesser quantities.

Railroads. China had only 6740 miles of railroads to cover an area of 4,500,000 square miles. There was practically no new construction after 1913. The 23 different railroad lines form two north and south trunk lines, one from Changsha below the Yangtze to Peking and one extending from Shanghai to Tientsin and on up to Harbin. There is one east and west trunk line, which, when completed, will extend from Lanchow, in Kansu, to Haichow, on the sea-

coast of Shantung. There were various connecting and disconnected short lines.

National Debt. On Oct. 21, 1921, China's national debt was reliably estimated at \$1,814,002,511.88 silver (\$1 silver = about \$.50 gold). In addition there was at least \$86,000,000 (silver) contracted in concealed debt, treasury notes, and unpaid salaries of officials, or a total of \$1,900,002,511.88. The detail of this debt, which was about \$5.00 (silver) per capita is as follows: secured on Maritime Customs and Salt Revenue: general foreign loans, \$267,979,252.34; foreign railway loans, \$334,802,631; foreign indemnities, \$482,841,744; internal long term loans, \$275,226,738; internal short term loans, \$69,101,978.54; treasury notes, \$18,640,000; total secured, \$1,449,592,343.88; unsecured: foreign obligations, \$217,047,073; native obligations, \$41,412,078; concealed debt, \$65,000,000; advances on salt, \$40,951,017; additional concealed debt, \$4,000,000; treasury notes, \$14,000,000; salt bonds, \$10,000,000; Dragon Boat Festival notes, \$2,000,000; unpaid salaries, \$20,000,000; total unsecured, \$450,410,163.

Revenue. The principal sources of revenue for the central government in 1922 were collections from the Maritime Customs, \$96,104,000 silver (1913, \$66,970,003 silver) and from the salt tax, \$85,789,000 silver (1913, \$77,401,265 silver). Of the latter sum, approximately one-third was retained by local military leaders and never reached Peking. These revenues were entirely designed to take care of the secured indebtedness. Thus it became necessary for the central government to use for administrative purposes what revenue reached it from the wine and tobacco monopoly tax, the mining tax, stamp tax, postal and telegraph surplus, and income tax, all collected by the provinces. About \$2,700,000 silver a year reached the central government from all these sources in 1922. In 1913 the government collected from all sources \$557,031,167 silver. The annual expenses of the central government according to the 1922 budget were about \$110,400,000 silver, which through rigid economy could be reduced not lower than \$48,000,000 silver, leaving an annual deficit of at least \$45,000,000 silver, which had to be met by annual borrowing or failure to pay salaries of school teachers, police, and officials in the central government at Peking. Various expedients such as the issuance of Treasury notes met with such popular disapproval that other methods had to be resorted to in order to meet this chronic annual deficit. In 1913 the expenditures were estimated as \$632,236,876 silver, a deficit of \$75,205,709 silver. In 1914 this deficit was reduced by a balance of \$25,477,283 silver, and the budgets for 1916 and 1917 balanced. Extensive borrowing in 1918 brought on the almost hopeless conditions of the 1920's.

Local Budgets. The 18 provinces, only one of which, Chihli, could be identified with the central government, all had independent methods of collecting revenue, and their expenditures were made without any reference to Peking. Sources of revenue differed greatly in the various provinces. In some, opium growing was openly encouraged, and the farmers were heavily taxed by the military leaders on their sales of the product. In most provinces *likin*, or barrier taxes, were levied indiscriminately by local authorities; the movement of goods along recognized routes was so heavily taxed that trade was seriously interfered with.

Some military leaders confiscated revenues from government railways and sent receipts for their military expenses to Peking in lieu of the cash.

Disarmament Conference and China. In order to remedy the worst phases of this situation the Nine Power Customs Treaty was signed at Washington early in 1922. It provided for a Special Customs Conference at Peking three months after ratification by all Nine Powers. At this conference China was to be allowed to increase the import tariff from a 5 per cent to a 7 per cent ad valorem rate, to be levied in such manner and for such purposes as the conference should decide. The conference had not met up to 1924, because France had not ratified the treaty. Considerable divergence of opinion existed as to the use that should be made of the increased revenue, which at most could not exceed \$50,000,000 silver a year. If funded at reasonable interest, this increased revenue would not pay China's outstanding unsecured indebtedness of \$450,000,000 silver. Considerable scaling down might have to be done on all obligations on the basis of the actual use made of the original loan or advance, and in the case of much of the native and some of the foreign indebtedness this would be extremely difficult. Some of the loans, particularly those of native bankers, were at extremely high interest rates, ranging from 12 per cent to 24 per cent, and some were issued as low as 40 per cent of face value. It seemed obviously unfair that such loans should be funded at face value or that their amounts should be increased because of a low funding rate of interest. The Nine Power Open Door Treaty asserted in treaty form the principles and policies of the Powers concerning China which had been observed since 1900, when Secretary Hay sent his famous circular note to all the Powers and received their assurances that they aimed at no encroachment on China's sovereignty. The Shantung Treaty between China and Japan provided for the return to China of the leased territory of Kiaochow, taken by Japan from Germany. Several resolutions adopted at the conference dealt with the abolition of foreign post offices in China; for the investigation of the question of abolishing extraterritoriality; and for other means of controlling and eliminating international conflict in China. See NAVIES OF THE WORLD.

Government. The new constitution promulgated Oct. 10, 1923, provided that the President be elected by an electoral college composed of the two houses of the National Assembly. He was to promulgate laws enacted by the National Assembly and supervise their enforcement. With the exception of the premier, whose appointment must be ratified by the House of Representatives, and the Chief Justice, ratified by the Senate, all officials were to be appointed and removed directly by the President. He might declare war and conclude treaties of peace only with the concurrence of the Assembly. The President, with the consent of the Senate, could dissolve the House of Representatives, provided a newly elected House convened within five months. A Premier and nine Ministers were to head the usual executive departments. The adoption of the constitution was no indication of approaching political stability but merely an attempt of a dominant military clique to impose some semblance of permanence on its tenure of office. The National Assembly

was to be made up of a Senate of 264 members and a House of Representatives of 596 members. It was to exercise the legislative power. The Senate was to be elected for six years by the highest local assemblies of the various provinces. The House of Representatives was to be elected for three years by the electors in various elective districts divided on a basis of population. But it was plain that military force and bribery were to continue dominating Parliament in the future as in the past. The supreme court was to consist of a chief justice and a number of associates, five of whom, sitting together, would constitute a court. Under it were to be district courts, one in each district or *hsien*, and higher courts, one in each province. The Supreme court was to have both appellate and original jurisdiction.

Provincial government varied greatly throughout China. Some were out-and-out military despotisms. Others had a semblance of constitutional government with provincial assemblies, etc., but some strong leader in each province always collected the taxes and acknowledged little or no allegiance to the central government. Thus in the three eastern provinces of Manchuria, General Chang Tso Lin was dictator; in Mongolia there was an independent government under the domination of Soviet Russia; Tibet and Sinkiang (Chinese Turkestan) gave only a shadow of allegiance to Peking; Sun Yat Sen dominated Kwantung province in the south; Tang Chi-yao dominated Yunnan province; Lu Yung-hsiang ruled Chekiang. By all of these military satraps, mandates and orders from Peking were openly disregarded. For the other provinces their effectiveness was regulated by the proximity and earnestness of the military forces of the Chihli province group dominating Peking. Actually, Peking, or the recognized government of China, exercised real control only over the city of Peking and its immediate environs. Wu Pei Fu, military dictator of Chihli province, supported the Peking government in 1924, and his support intimidated neighboring provincial military leaders into merely passive resistance and effective confiscation of revenue. Because Peking was dominated by one of the military cliques, any process of unification of China had necessarily to proceed along military rather than constitutional lines. As the independence of these provincial leaders continued to grow, their observance of rights guaranteed to foreigners in their provinces by treaties with foreign powers made by the Peking government inevitably became more lax. The foreign powers possessed no recourse against these provincial leaders, who exercised the real power, for violation of their treaty rights, but were compelled to protest to Peking, whose power over the provinces was nil. Foreign treaty rights were therefore subject to constantly greater violation without the possibility of any recourse by the Powers. The Powers, who, at the Washington Conference, offered China every opportunity to achieve absolute autonomy in respect to all of the functions exercised by foreign governments over their nationals in China, including taxation, criminal and civil authority, etc., were faced with the disagreeable task of either intervening in the domestic affairs of China or witnessing a complete disavowal of all of the treaty rights of foreigners in carrying on their peaceful and legalized pursuits.

History. At the beginning of 1914, Yuan Shih-k'ai was carefully proceeding in the execution of his plans for the reconstruction of the old autocratic government and of the centralization of power. Step by step he emasculated the innovations of western democracy and parliamentarianism. Outside of the circles of Young China these measures produced little reaction, for the mass of people were not greatly interested in the western innovations which ran counter to their instincts and customs, and, after all, they were tired of being looted in the name of liberty. It was only when the President decided to perform henceforth the Winter Solstice sacrifice at the Temple of Heaven that the people began to take notice, because by performing this ceremony, the symbol of the old emperors' function in the state, he practically proclaimed himself an autocratic ruler. This policy of Yuan Shih-k'ai was strikingly demonstrated by the presidential mandates, especially the Presidential Election Law of December, 1914, whereby the President's term of office was lengthened to 10 years. Deftly Yuan Shih-k'ai's astute statesmanship restored the authority of the central government, at the head of which he ruled as undisputed dictator.

If the restoration of the monarchy and the realization of Yuan Shih-k'ai's designs on the throne had been merely matters of internal politics, they would probably have succeeded. But questions of foreign policy intervened to frustrate Yuan's schemes. After the capture of Kiaochow the Japanese government presented on Jan. 18, 1915, a protocol embodying the notorious Twenty-one Demands, the fulfillment of which would have meant the grossest infringement of Chinese sovereignty that had occurred thus far. (See JAPAN and SHANTUNG.) After four months of negotiations, in which Yuan Shih-k'ai took the stand that acceptance of the demands would tend to impair China's sovereignty and the treaty rights of other Powers, the Chinese Foreign Office was compelled by a 48-hour ultimatum to accept most of the Japanese demands, in slightly modified form. As originally presented, the Twenty-one Demands were grouped in five sections. The first section required the Chinese government's full assent, in advance, to whatever settlement Japan and Germany might make regarding the disposition of German rights in Shantung, and the opening of additional commercial ports in Shantung and the construction of a branch from the Shantung railway to Chefoo or Lungkow. These stipulations were accepted with very little alteration and embodied in a treaty and several notes signed on May 25, 1915. In return, Japan agreed to return the leased territory of Kiaochow Bay to China, after the War, if certain conditions were fulfilled (see PEACE CONFERENCES and SHANTUNG). Section II, likewise accepted and embodied in a treaty with several supplementary exchanges of notes, strengthened Japan's grip on southern Manchuria and eastern inner Mongolia, by extending the Japanese lease of Port Arthur, Dalny, the South Manchurian Railway, and the Antung-Mukden Railway to 99 years, by granting Japanese subjects the right of leasing or owning land and engaging in any kind of business, by handing the Kirin-Changchun railway over to Japanese administration, and by assuring to Japan an option on the development of mines, financing of railways, and nomination of foreign advisers

in these provinces. Section III proposed to convert the Hanyehping Company, the great Chinese coal, iron, and steel concern located at Hankow on the Yangtze, in the British sphere of influence, into a joint Sino-Japanese enterprise with monopolistic control of future mine development in the neighborhood. To this extraordinary demand, China assented in an exchange of notes, but the clause relative to future mining operations was omitted. Section IV embodied a blanket pledge on the part of China "not to cede or lease to a third power any harbor, bay, or island along the coast of China"; this pledge China refused to incorporate in any treaty or note, as such a declaration would have implied a Japanese protectorate.

Finally, Section V, or "Group Five" as it was more commonly called, contained provisions that would have meant the firm establishment of a Japanese protectorate over China; China was to employ "influential Japanese as advisers in political, financial, and military affairs"; Japan was to have a share in the police administration "of the important places in China"; China was to purchase "say 50 per cent" of her war munitions from Japan, either directly or through a Sino-Japanese arsenal. Furthermore, Japanese were to be allowed to propagate religious doctrines, i.e. Buddhism, in China; Japanese hospitals, churches and schools were to be given the right of owning land; Japan was to build certain railways in the Yangtze valley, again infringing on the British sphere of influence; and Japan was to have an option on supplying capital for mines, railways, harbors, and dockyards in Fukien province. To Group Five the Peking government resolutely refused assent; the most that could be conceded was an exchange of notes stating that China had not given any foreign nation permission to construct military or naval works on the Fukien coast; there had been rumors of an agreement for such construction by the Bethlehem Steel Company.

Although the other items in Group Five were temporarily dropped, the Japanese government merely postponed them "for future discussion"; and they may be regarded as significantly expressive of the imperialist aims of the Japanese government in 1915. The net result of China's partial acquiescence in the Twenty-one Demands of 1915 was to fortify Japan's privileged position in her spheres of influence—South Manchuria, eastern Mongolia, Shantung, and Fukien—and to open the heart of the rich Yangtze valley to Japanese economic penetration. The attitude of the United States government toward the Japanese manoeuvre was set forth in identical notes to China and Japan, May 9, stating that the United States could not recognize any agreements impairing treaty rights, the integrity of China, or the Open Door; and as Secretary Bryan had already issued a statement to the press on May 6, expressing his hope that the agreements might be mutually "satisfactory" and contribute to the "prosperity" and "cordial relationship" of "these great Oriental empires," it was obvious that the United States, while formally supporting Chinese integrity, was not disposed to offer any determined opposition to Japanese aggression.

These events served to make it clear that in any fundamental change in the Chinese govern-

ment, such as the restoration of the monarchy, Japanese intervention would have to be reckoned with. When, therefore, the State Council referred the question of the monarchy to a vote of the provinces, in October, 1915, the Japanese Minister in Peking, supported by his British and Russian colleagues, "offered friendly advice" on behalf of his government against the restoration of the monarchy. This intervention of the Powers, especially of Japan, sealed the fate of Yuan's aspirations to the throne. Although the provinces registered a unanimous vote in favor of his accession on Nov. 5, 1915, the proclamation of the monarchy on December 12 was followed almost immediately by an insurrection, which rapidly accumulated speed and became universal. The southern leaders set up a provisional government at Canton and hailed as president the former Vice-president, Li Yuan-hung. After many and prolonged manoeuvres to save his face, Yuan Shih-k'ai died on June 5, 1916, of a broken heart, as it was said. Li Yuan-hung became President of the Chinese republic, and Tuan Chi-jui, Premier. If Yuan's death was universally regarded as a temporary solution of China's great internal problem, it proved almost at once to be quite the opposite.

After Yuan's death, conditions in China became rapidly more chaotic. The new Peking government made a show at parliamentary government by convening the Parliament of 1913 for Aug. 1, 1916. Its measures, however, did not tend to produce any coöperation from the southern or Canton government. The essential difference between the two camps was that Peking was dominated by the military party, a combination of military governors and shrewd politicians, in which the former used the latter for their purposes, whereas Canton represented the Kuo Min-tang party and Young China with their exuberant enthusiasm for western democracy. During the remainder of 1919 the political situation grew more disorganized. At the same time the financial situation went from bad to worse. In the spring of 1917 China's entrance into the War on the Allies' side offered a temporary way out of the difficulties besetting the country. After numerous political intrigues and wrangles, after coaxing and veiled threats from the Allies, and especially after persuasion by the United States, the Peking government finally severed relations with Germany on Mar. 14, 1917. It was clearly a matter of German intrigues having been outmatched by Allied intrigues. The declaration of war, however, was not to take place without a three months' struggle among the various opposing internal factions. The first phase involved a conflict between the protagonists of drastic action, Premier Tuan Chi-jui and the military party on the one side, and President Li, the Kuo Min-tang, and the Canton chieftains, who favored a declaration of war by parliamentary procedure, on the other. An entangled situation developed, President Li was compelled to dissolve Parliament unconstitutionally. He dismissed Premier Tuan on May 23, 1917, whereon the latter in conjunction with the military governors set up a provisional government at Tientsin. The internal strife was further accentuated by the American note of June 6, deploring the growth of internal dissensions and intimating that internal unity was more important than a declaration of war. This ethi-

cally justifiable move on the part of the United States was resented by Japan, as Tuan Chi-jui was generally regarded as a Japanese tool and had carried on a policy in accordance with Japan's wishes. A solution of the difficulties seemed to be provided by the "mediation" of General Chang Hsün of Shantung, who on June 12 arrived before Peking with an army. Chang Hsün's real intention, however, was the restoration of the Manchus and not the solution of the war issue. After 18 days of seemingly satisfactory mediation in Peking, which was only a face-saving manoeuvre, Chang Hsün struck his coup d'état on July 1, 1917, and restored the Manchu Emperor to the throne. But the rule of the young Son of Heaven lasted only 12 days. Tuan Chi-jui emerged from Tientsin and at the head of an army composed of the troops of the military governors and of the republican South ejected Chang Hsün and his Manchu Emperor and reestablished the Republic. The action of Tuan and the Tuchuns (military governors), who were all known to be monarchists, was due to the fact that the blunt and energetic Chang Hsün had stolen a march on them, much to their chagrin.

The farcical coup d'état and restoration of the Republic resulted in the resumption by Tuan of the premiership and the replacement of Li Yuan-hung as president by Vice President Feng Kuo-chang on July 18. The most important result was, however, the final declaration of war on Germany on Aug. 14, 1917. This involved the sequestration of German property and above all the systematic uprooting of Germany's financial and commercial interests in China. As a reward for joining the Allies, China received, by an agreement between the Consortium banks, a loan of 10,000,000 yen, secured against the salt gabelle revenues, as well as a suspension of the Boxer indemnities. The new government wielded relatively strong authority, especially in view of its submission, not to say subservience, to Japanese wishes. Its position, however, was seriously weakened by the opposition of the South. The southern faction had regarded a declaration of war without approval by Parliament as unconstitutional and had also protested against the exclusively militarist character of the Peking government. In June, 1917, after the dissolution of Parliament, the situation came to a head. The southern provinces revolted, and a new government, headed by Dr. Sun Yat-sen, was set up in Canton. Dissension developed thereupon among the Peking leaders about the methods to be adopted against the rebellious South. President Feng favored conciliatory methods, while Premier Tuan wished to use strong military measures. A hopeless tangle ensued, with war between the North and South, some provinces remaining neutral; a conflict between the heads of the Peking government; and independent action on the part of the northern Tuchuns. Premier Tuan finally had his way, and as a result the war against the southern secessionists was carried on with fluctuating success during the remainder of 1917 and the first half of 1918. To preserve a semblance of constitutionality, Tuan convened an assembly for a revision of the electoral law. On the promulgation of this law on Feb. 17, 1918, a new parliament was elected, which on September 4 chose a new president. Feng Kuo-chang, who had proved unsatisfactory to the Anfu Club was replaced by

Hsü Shih-chang. The new president made a sincere effort to end the civil war between the North and the South, and accordingly on Nov. 16, 1918, he ordered the northern commanders to suspend hostilities and withdraw from southern territories. This armistice was eventually followed by a peace conference in the spring of 1919 at Shanghai, which dragged out interminably and ended in failure. Actuated by selfish motives, neither faction showed an earnest desire to come to an agreement.

Under Tuan Chi-jui and the Anfu party, China became powerless in the hands of the Japanese, since the Allies were too preoccupied with the war in Europe to interfere. In March, 1918, the Peking government concluded military and naval agreements with Japan whereby the Japanese, under the pretext of action against a Bolshevik danger, obtained a complete hold on northern China, including control of the Chinese Eastern Railway and northern Manchuria. At the Peace Conference, Japan's actions with regard to China during the War received the official endorsement of the Allied Powers when Lloyd George and Clémenceau, in accordance with secret pledges given to Japan in 1917, and President Wilson, in order to save the League of Nations, accorded Japan all the former German "rights, title, and privileges in the province of Shantung." (See PEACE CONFERENCES.) The Chinese delegates, supported by Chinese public opinion, pleaded their case with ardor and ability and refused to sign the Versailles Treaty, which contained the article relating to Shantung. The decision of the conference aroused vehement indignation in China, which Young China successfully employed to launch an anti-Japanese movement. The general disappointment and resentment of the Chinese people, who derived some comfort from the fact that the United States refused to ratify the Treaty, were directed primarily against the ruling Anfu party, whose pro-Japanese policy was blamed for the national misfortune. Although in the great excitement the guilt of that political clique was greatly exaggerated for reasons of internal policy, there was nevertheless much cause for such feeling, since the position of the Chinese delegation at the conference had been seriously injured when it became known that the Tuan government had concluded in the fall of 1918 a secret agreement whereby Chinese rights with regard to Shantung had been practically surrendered. In the summer of 1920 the anti-Japanese movement, under the influence of the agitation of the students, drove Tuan Chi-jui and the Anfu Club from the government. The Anfu leaders took refuge in the Japanese Legation, and some of them fled subsequently to Japan to escape popular wrath.

Japan worked hard to consolidate her position in China, but after the Peace Conference the Powers were once more able to devote their attention to Far Eastern affairs, and subsequent events brought about a partial modification of the Japanese policy in China. The new Peking governments were less subservient to Japan than the Anfu leaders and strove to recover some of the ground lost during the War. Repeated attempts on the part of Japan in 1920 and 1921 to come to an agreement with China regarding Shantung by offering to restore the territory provided certain concessions were granted her, failed because of Peking's steadfast refusal to consider anything short of al-

most unconditional evacuation. At the Washington Conference (q.v.) at the end of 1921, the Chinese delegation insisted on bringing the Shantung question before the Conference. The Japanese, on the other hand, wanted to negotiate with the Chinese directly, for this would have confirmed the tacit Japanese contention, contained also in the Lansing-Ishii Agreement, that China was in fact an informal Japanese protectorate. The Conference decided on a compromise by conceding the Japanese demand but providing for Anglo-American mediation in case of deadlock. When the deadlock actually took place the English and American mediators, influenced by public opinion at home, brought pressure to bear on the Japanese to give way. The Shantung Treaty which was signed by Japan and China early in 1922 provided for the restoration to China of the former German Leased Territory of Kiaochow and all public properties therein, together with the Tsingtao-Tsinanfu Railway and its branches, the value of the railway properties being reimbursed to Japan by China. The conference reached, in addition, numerous other agreements of primary importance to China. (See SHANTUNG and WASHINGTON CONFERENCE.) The lapsing of the Anglo-Japanese Alliance (q.v.), as a result of the conclusion of the Four Power Treaty, should affect China greatly in the future, inasmuch as Great Britain in consequence thereof will be inclined in the future to cooperate with the United States rather than with Japan in regard to Chinese affairs. The surrender by the Japanese of Kiaochow Bay induced the British to promise to relinquish the Leased Territory of Wei-hai-wei. Provisions were also made for a revision of the customs schedule and for the abolition of the foreign post offices in China. The conclusion of the Nine Power Treaty reaffirming the Open Door and the integrity of China brought with it also the abrogation of the Lansing-Ishii Agreement.

In general the Washington Conference resulted in a material improvement of the Chinese situation with reference to the Powers. Whether it was due to pressure from the Powers or to a voluntary new orientation of Japanese policy, Japan seemed to modify thereafter her policy of encroachment on Chinese territory and sovereignty. By far the most important result of the Washington Conference with regard to China was, however, the adoption of the Open Door policy, which in substance amounts to a concerted exploitation of China by the Powers as over against competitive exploitation based on spheres of influence in the past. This development is to be ascribed directly to the efforts of the United States. The Chinese Loan Consortium and its workings were part and parcel of this policy. An agreement had been arrived at in October, 1920, whereby combined financial supervision over China had been provided through the establishment of a Four Power Consortium to represent banking interests in the United States, Great Britain, France, and Japan. The chief points in the arrangement were the establishment of an international board for the abolition of special spheres of influence, insistence on the disbanding of troops, and the combining of all railway concessions into a large Chinese railway system financed and supervised by the Consortium.

After the fall of Tuan Chi-jui and the Anfu Club from power the government passed into

the hands of the Chihli faction, which was led by the two powerful Tuchuns, Tsao Kun and Chang Tso-lin. This event meant the substitution of one military faction for another. High hopes for an improvement in internal conditions did not materialize. General Wu Pei-fu, who had been an important factor in the defeat of the Anfu Club, and who had come to the fore with the proposal for a National Convention, was deftly pushed aside. The ruling politicians of the Chihli faction began anew and on a greater scale the old struggle for spoils. The concentration of power in the hands of a few powerful super-Tuchuns who could more effectively deal with the Peking politicians than a larger number of lesser chieftains reduced the authority of the central government to a mere shadow. The President and the members of the cabinet became figureheads who governed without Parliament, obeyed the command of the Tuchuns, and were removed by the latter at will. Thus in 1921 Tsao Kun and Chang Tso-lin caused the fall of two cabinets because they were displeased with the policy of Peking. In the South the situation was no different. The Canton government had become disrupted, and intermittent fighting took place between Sun Yat-sen, his former lieutenant Chen Chiung-ming, and other factional leaders. New hope for the early cessation of the internal strife was derived from the struggle of the super-Tuchuns for supremacy in 1922. Wu Pei-fu, lord of the Yangtze, opposed Liang Shih-yi who was a creature of Chang Tso-lin, lord of Manchuria. An armed struggle took place between Wu and Chang in the course of which the latter was defeated and driven back to Manchuria. By virtue of his victory over the powerful Chang, General Wu found himself in the position of dictator. He forced President Hsu Shih-chang and the Cabinet to resign and recalled former President Li Yuan-hung and the twice-dissolved Parliament of 1917. In view of Li's reputation as a defender of parliamentary rule and of General Wu's supposed liberal tendencies, these developments gave rise to hopes for the establishment of orderly and constitutional government.

These hopes were sadly disappointed, for neither President Li, nor Parliament, nor the Cabinet, which was composed of leaders of Young China, were able to cope with the situation, and General Wu's good intentions had been grossly exaggerated. The Tuchun rule remained essentially the same as before, with each of the three powerful leaders, Wu Pei-fu, Tsao Kun, and Chang Tso-lin, striving for supremacy. Likewise the relations between the North and the South did not undergo a change. During 1922 and 1923 General Wu repeatedly prepared to invade the South for a final combat with the Canton government but in each case was prevented from doing so by the rivalry of the other Tuchuns. Sun Yat-sen also was too occupied with fighting his rivals in the South to carry out his threat to move against Peking. Slowly, however, two large hostile camps evolved, the northern group under Wu Pei-fu and Tsao Kun, with Chen Chiung-ming in the South as collaborator, and the southern group, led by Dr. Sun Yat-sen, who counted on the aid of Marshals Chang Tso-lin and Tuan Chi-jui in the North. Open hostilities did not develop for some time because the leaders on either side were too busy fighting their rivals

and pursuing their own petty schemes. New political squabbles and intrigues took place at Peking during the first half of 1923, in the course of which President Li Yuan-hung clashed with the militarists and was forced to seek refuge in Tientsin. When compelled by the governor of Chihli, a follower of Tsao Kun, to renounce all claims to the Presidency, he fled to Shanghai, where he attempted unsuccessfully, in conjunction with 200 members of Parliament, to form a provisional government. Li subsequently found an asylum in Japan, and thus eliminated him for the time being from the Chinese political arena. The election of a new president was delayed for some time, because the absence of some 200 members in Shanghai left Parliament short of the three-fourths majority required for a presidential election.

After several months of deadlock, Marshal Tsao Kun, who was very eager to become president, bribed a sufficient number of the recalcitrant members to return and was duly elected in October, 1923, by 420 votes, for each of which he paid \$5000. He thus emerged as the most powerful factor in the North. His reputation as a veteran military leader, his great military and financial resources, and his alliance with Marshal Wu Pei-fu aroused hope that in the end he would be the man to unite the many factions and bring order out of chaos. On the whole Tsao Kun used his new authority well, inasmuch as he installed a cabinet which enjoyed public confidence and immediately on his inauguration had Parliament adopt a new constitution which superseded the old provisional constitution and which provided for far-reaching provincial decentralization. Moreover he faithfully supported Wu Pei-fu in his campaign against the South, which assumed a new and more promising aspect during the first half of 1924. In the spring of that year General Wu finally succeeded in conquering a large portion of Southwestern China and thereby obtained a strategic position for the final attack on the Canton government. While the military situation thus changed in favor of the Peking government, there still remained in the extreme North the powerful Chang Tso-lin, who with Japanese support successfully challenged the authority of Peking from his stronghold in Manchuria. General Wu's victories in the South materially increased his power and gave him additional influence on the internal affairs of the Peking government. As long as Wu Pei-fu and Tsao Kun remain allied and sink their personal rivalries and ambitions into effective cooperation toward the unification of China, there seems reason to hope that this end will finally be attained. Meanwhile the confused situation in the South continued without change. Sun Yat-sen carried on desultory warfare against his southern rivals. Having exhausted all means of obtaining the necessary financial support, Dr. Sun started several times during 1923 and the early part of 1924 to seize the customs revenues in Canton which had been pledged against foreign loans. These moves involved him in difficulties with the Powers and brought foreign warships to the scene.

Perhaps the most serious difficulties besetting China during the last few years of the decade were financial disorders and the bandit problem, which were direct results of internal strife and Tuchun rule. The Peking government found it increasingly difficult to collect revenues for car-

rying on the administration and for paying outstanding foreign obligations. The military governors in the interior withheld the taxes and used them for their own selfish purposes while certain lucrative revenues, such as the customs duties and the income from the salt gabelle, were pledged as securities for foreign loans. At the same time the financial supervision of the Consortium struck a snag because the Chinese government refused to give the guarantees which were regarded by the international bankers as absolutely necessary for the stabilization of Chinese finances. The bandit problem was no less vexing. Endless civil war and Tuchun rule had resulted in a tremendous increase of the mercenary soldiery fighting for one or the other of the many factions. On the failure of the chieftains to pay their undisciplined hosts, or on their disbanding, these soldiers resorted with arms in hand to open banditry. For lack of authority the central government was either unable or unwilling to cope with this situation. Consequently murder, rape, and robbery were almost daily occurrences. Many cases of kidnapping of foreigners, particularly of missionaries, took place during 1923 and the early part of 1924. The most flagrant incident was the derauling of the Shanghai-Peking Express on May 6, 1923, which resulted in the abduction of some 300 passengers, including 20 foreigners. This affair elicited sharp protests from the Powers. After dilatory tactics on the part of the Peking government, the foreign prisoners were released some months afterward and remedial measures were taken in the fall of the year, but no actual alleviation of the bandit evil was effected. In fact, certain occurrences seemed to invite the conclusion that the bandits operated with the connivance of some of the military governors and that the Peking government was afraid or unwilling to take strong measures against them.

Of late years some improvement took place in China's relations with foreign countries. As a result of the Washington Conference and from other causes, Japan's attitude toward China underwent a slight modification. In accordance with the Treaty concluded at Washington, Tsingtao was returned to China on Dec. 10, 1922, against the payment of 14,000,000 gold yen, and the Tsingtao Railroad was restored on Jan. 1, 1923, on China's promise to compensate Japan in due time by the payment of 53,000,000 gold marks. A Chinese note of Mar. 10, 1923, requesting the abrogation of the Sino-Japanese Treaties and Agreements concluded in the spring of 1915, was met by Japan with a blunt refusal. (See JAPAN.) Japan maintained her hold on Inner Mongolia and Manchuria, and in the latter province she encouraged Chang Tso-lin in his open defiance of the Peking government. (See MONGOLIA and MANCHURIA.) The restoration of Wei-hai-wei by Great Britain and of Kwang-chow-wan by France, in accordance with the agreement concluded at the Washington Conference (q.v.), had not been effected by the summer of 1924. The delay in regard to Wei-hai-wei was due to the failure of Great Britain and China to agree on the terms of surrender, while the refusal of the French to return Kwang-chow-wan at this time must, no doubt, be ascribed to the difficulties between France and China over the Boxer Indemnity installments. The Chinese insisted on paying these installments in the depreciated French pa-

per currency instead of in gold francs as the French demanded. The protracted wrangles over this question were also responsible for the failure of the French to ratify the Washington Treaty which provided for a 2½ per cent increase in the Chinese Tariff (see WASHINGTON CONFERENCE) and thus brought about indefinite delay in the application of this very important financial agreement. Of outstanding importance were the agreements concluded between China and Soviet Russia during the spring and summer of 1924. These should greatly affect China's relations with the Powers. Since the consolidation of Soviet rule in Siberia, Russia adopted a definite Chinese policy and began to make overtures to China. This policy resulted after many preliminary negotiations in the conclusion of a treaty between China and Soviet Russia on May 31, 1924, whereby Russia obtained full and unconditional recognition from China and control over the Chinese Eastern Railway, while she pledged in return to withdraw her troops from Outer Mongolia. (See MONGOLIA.) In substance this meant the entrance of Soviet Russia into the Chinese arena in opposition to the western Powers. In the light of the rearrangement of Far Eastern policies at and since the Washington Conference and the reported Russo-Japanese rapprochement, this development should be of far-reaching significance for China and might well foreshadow a Russo-Japanese understanding with regard to China. Protests against the agreement were entered by the United States, France and Japan, on the ground that their financial interests in the Chinese Eastern Railway were not adequately protected.

CHINA, ANCIENT CIVILIZATION OF. See ETHNOGRAPHY.

CHINARD, GILBERT (1881-). A French philologist. He was born in Chatellerault, and studied at Poitiers and the Sorbonne. He was professor of French language at the College of the City of New York in 1908, then for four years at Brown University, and from 1912-19 at the University of California, teaching during the summer sessions at Columbia University. Since 1919, he has been professor at Johns Hopkins. He has published among other works: *L'exotisme américain dans la littérature française au XVIème siècle* (1911); *L'Amérique et le rêve exotique* (1913); *L'exotisme américain dans l'œuvre de Chateaubriand* (1918); *Chateaubriand, Les Natchez* (1919); and *La doctrine de l'américanisme* (1919).

CHIROL, SIR VALENTINE (1852-). An English journalist and writer on the Orient (see VOL. V). His later works include: *Cecil Spring-Rice: In Memoriam* (1919); *The Egyptian Problem* (1920); and *India Old and New* (1921).

CHIROPRACTIC. A system of preventing and healing disease by manipulation which followed the success of osteopathy but which its practitioners assert to be of independent origin and derived by its originator, D. M. Palmer, from discoveries made accidentally during so-called magnetic healing. At first a practitioner of the latter and conductor of a school of magnetic healing, D. M. Palmer, then of Davenport, Iowa, changed his methods to what he designated as chiropractic. He soon established his cult in Oklahoma, where he opened a college. This period, from the accidental discovery until the establishment of the school, covered the decade

1895-1905. Palmer later removed to California and continued his practice there until his death at San Diego in 1913. Disputes arose as to the legitimate successor of Palmer and also as to the essential features of chiropractic. In the absence of harmony among the leaders it is exceedingly difficult to present a satisfactory sketch of the movement. E. D. Palmer, son of the founder, opened a school of Chiropractic at Davenport which turned out thousands of graduates practicing the so-called Palmer method. On the other hand, Wilfred Carver, originally a practicing attorney who acted in a professional capacity for D. M. Palmer, became interested in the method, and in 1909 he published the first work on the subject. He was at the head of the Carver School of Chiropractic in New York in 1924. He also drew the bills for legitimizing the practice of chiropractic in Oklahoma in 1907 and in the District of Columbia in the following year. In the meantime the practice had been legalized in several States, while bills were pending in others. By 1924 the cult claimed many thousand practitioners and millions of adherents. It seemed to have outstripped for the time the older cult of osteopathy, which had progressively elevated its standards and eliminated the opportunities for practice by the unqualified.

It was admitted by the legitimate chiropractors that many bogus graduates and unqualified practitioners were usurping the name and functions of chiropractic, and they asserted that universal legalization of the practice would be necessary to eliminate this fraudulent element. Owing to the highly technical character of the manipulations of chiropractic, as well as the different conceptions of the art by its own practitioners, and the resemblances between chiropractic and osteopathy, no attempt will be made to describe them here. The late Dr. A. Abrams of San Francisco attempted in 1910 to incorporate the teachings of both osteopaths and chiropractors in a highly technical work called *Spondylotherapy*, which in a few years passed through five editions. This book is not regarded as authentic by the cults mentioned, both of which issue their own textbooks and propaganda; but it is of much interest as a document seeking to establish manipulation of the vertebrae on a scientific basis.

CHITTENDEN, RUSSELL HENRY (1856-). An American physiological chemist (see VOL. V). During the War, Chittenden was a member of the Advisory Committee on Food Utilization and also a member of the Executive Committee of the National Research Council. He edited the United States Report of the Inter-Allied Scientific Commission.

CHLORINE. See CHEMISTRY.

CHODAT, ROBERT (1866-). A Swiss botanist (see VOL. V). In 1914, he was made a member of the Lennean Society and in 1908 became director of l'Herbier Boissier. He published another volume of *Principles of Botany* in 1920, and *Vegetation of Paraguay* (1916, 1921).

CHÖSEN. See KOREA.

CHRISTEN, JOSEPHINE (1869-). An Austrian sculptor and feminist. She was born in Bohemia of Czech and French parentage. She studied music and for 13 years was on the operatic stage under the direction of the famous manager Angelo Neumann. Then she studied art in Prague and later in Paris, and

in 1908 settled in Vienna. From 1915 to 1917, she was with the Austrian army as official sculptor, and in 1918 exhibited her war work. Since then she has become absorbed in political life, and is the founder and president of the Austrian women voters' association. Her principal works are "Cain," "Salome" and "The Consoling Muse." She has also done many private monuments and has exhibited in Paris, Vienna, Turin, etc. Her unusual versatility is proved by the fact that she has also published musical compositions, among them a mass.

CHRISTIAN X, CARL FREDERIK ALBERT ALEXANDER VILHELM (1870-). King of Denmark (see Vol. V). By his personal popularity and tact he was able during the War to keep Denmark to a strict neutrality. The great event of his reign was the plebiscite which brought back North Schleswig to Denmark. During his reign more than 2500 square miles of useless land were reclaimed to agriculture; a merchant marine was developed; world-wide commercial enterprise launched, such as the Great Northern Telegraph Company and the East Asiatic Company; and a number of important scientific discoveries were made.

CHRISTIAN CHURCH. During the decade 1914-24 the Christian Church changed the name of its administrative body from the American Christian Convention to the General Convention of the Christian Church. According to the Federal census there were, in 1916, 1213 ministers; 1265 churches, including 111 colored; 118,737 members, including 10,120 colored; and 1115 Sunday schools, with 91,853 members. These compared with the statistics reported to the denomination in 1923 as follows: 1002 ordained ministers, including 204 colored; 1179 unordained, including 177 colored; 1134 churches, including 169 colored; 103,091 members, including 10,258 colored; 851 Sunday schools with 82,614 members; and 301 Christian Endeavor societies with 7141 members. It was estimated by the secretary that membership was 10,000 more than that reported in 1923.

The foreign mission work was extended in the 10 years by the addition of two single workers and one family in Japan, and one single worker and two families in Porto Rico. There was a corresponding gain in the number of national workers in each field, and new types of work were added, including kindergartens, a night school, newspaper evangelism and a lending library of religious books, and a large amount of interdenominational cooperative work. A church, a parsonage, and a mission home were added to the equipment in Porto Rico; and three chapels, three combination chapel-kindergarten-parsonages, and one kindergarten building were added in Japan, and a good deal of rebuilding was done following the earthquake. New stations were added in both fields. The total membership of churches in Porto Rico increased from 200 in 1914 to 300 in 1924, and in Japan from 819 to 1694.

The departments of Sunday school, Christian Endeavor and education were merged into the department of Christian education, a department of evangelism and life recruits was added, and stewardship was being pushed by a secretary. The home mission department more than trebled its income and its force of workers, added work among Indians, new Americans and mountaineers, and developed a church exten-

sion work. The denomination conducted six colleges, one diocesan school, and a college for colored people at Franklinton. The college buildings at Elon College, N. C., which were totally destroyed by fire in 1923, were replaced by larger and wholly modern buildings. Books, tracts and several magazines were published by the denomination.

CHRISTIAN ENDEAVOR, UNITED SOCIETY OF. Founded in 1881. This is an interdenominational society of young people whose purpose is the training of converts for church membership and church work. Its activities are divided into four classes: junior, intermediate, and senior societies, and alumni councils. The number of societies throughout the world increased from 75,000 in 1914 to 79,157 in 1923. From 1917 to 1923, when the world increase was from 78,039 to 79,157, the number of societies in the United States decreased from 52,462 to 46,560, the number in Canada decreased by four, from 4094 to 4090, and the number in foreign countries increased from 21,483 to 28,507. The Comrades of the Quiet Hour, who devoted themselves to a definite period of meditation and prayer each day, increased in membership from 168,779 in 1918 to 225,277 in 1923; the Tenth Legion, whose members gave one tenth of their incomes to religious work, increased in membership from 51,302 to 66,901; and the Life Work Recruits, young people who were ready to give themselves to full-time church service, increased from 4668 to 7217. In 1919 an alumni department was established. The degree of Christian Endeavor Expert was given to 39,864 young people who passed a definite examination in Christian Endeavor method.

CHRISTIANS. See **CHRISTIAN CHURCH.**

CHRISTIAN SCIENCE. The number of Christian Science organizations increased from 1351 in 1915 to 2117 in 1924; the number of lectures given, from 1530 to 3084, the estimated attendance being 1,200,000 and 2,389,677 respectively. The trustees under the will of Mary Baker Eddy announced in 1914 that they would use the income of the trust to contribute toward the expense of distributing authorized literature throughout the world, to the expense of lectures given outside the United States, Canada, and Great Britain, and to assist so far as possible in building church edifices. During the year ending June 1, 1924, the number admitted to membership in the Mother Church was greater than at any time during the history of the movement. Reports from branch churches throughout the world also indicated a substantial growth in membership and regular attendance. The sale and distribution of authorized Christian Science literature, including the circulation of the *Christian Science Monitor*, showed a marked increase. In 1917 Mrs. Eddy's major work, *Science and Health with Key to the Scriptures*, was published in French, and the French *Héraut de Christian Science*, a monthly periodical, was established. Pamphlets on Christian Science were published in practically every language known to civilization.

During the War the denomination maintained relief work among the soldiers and sailors of the various countries, which, together with its healing work, was the subject of favorable comment by men high in government, military, and medical authority. Christian Science chaplains

for both the army and navy were appointed. Through one of these relief work was carried on in the Near East. The prompt and generous aid furnished by the Mother Church and its branches to the earthquake sufferers in Japan was officially recognized by the Japanese government. Prominent among the important changes of 1914-24 favorably affecting the legal status of Christian Science as a purely spiritual system of healing was the incorporation of an amendment in the Federal Maternity and Infancy Bill (see MATERNITY PROTECTION), giving to parents or guardians the right to determine the form of treatment to be administered to a child. As a result of legislative enactment Christian Science became an authorized mode of healing in the United States and practically all foreign countries. A sanatorium was opened in 1920 at Brookline, Mass., for the purpose of healing the sick and caring for some of those who had been associated with Mrs. Eddy in establishing the Christian Science Church and who were in need of provision for their peace and comfort during their mature years. In 1919 the trustees of the Christian Science Publishing Society brought suit against the Christian Science Board of Directors of the First Church of Christ, Scientist, in Boston, called the Mother Church, to determine whether the trustees or the Board of Directors had control over the policies of the publications. The Supreme Court of Massachusetts handed down a decision in favor of the Board of Directors in 1921. A memorial to Mrs. Eddy in Mt. Auburn Cemetery, Cambridge, Mass., was completed in 1917 at a cost of \$150,000, raised by voluntary contributions from beneficiaries of Christian Science.

CHRISTIE, GEORGE IRVING (1881-). An American educator, born at Winchester, Ont., Canada. He graduated from Iowa Agricultural College in 1903 and from that year to 1905 was assistant in agronomy in the Iowa State College. From 1905, he was connected with the agricultural department of Purdue University as superintendent of agricultural extension, director of the Agricultural Experiment Station, and director of the Summer School for Teachers. From 1917 to 1919 he was State Food Director for Indiana, and was assistant secretary of agriculture in 1918-19. He was also a member of several important boards relating to agriculture during the War, and in 1919 was a member of the National Commission for the Employment of Soldiers and Sailors.

CHRISTY, HOWARD CHANDLER (1873-). An American painter (see VOL. V). He returned to portrait painting in 1920 and painted portraits of Will. H. Hays, George Harvey, Post Wheeler and others. He also painted the picture of the late President Warren G. Harding for the U. S. S. *Leviathan*.

CHROMOSOMES. See ZOÖLOGY.

CHUBB, PERCIVAL (1860-). An American educator (see VOL. V). He was president of the Drama League of America from 1915 to 1917 and from 1918 to 1920.

CHURCHES OF CHRIST IN AMERICA, FEDERAL COUNCIL OF. See FEDERAL COUNCIL OF CHURCHES OF CHRIST IN AMERICA.

CHURCHILL, CHARLES SIMON (1856-). An American railway official, born in New Britain, Conn. He graduated from the Sheffield Scientific School in 1878 and from 1879

to 1881 was engaged in surveys and railroad construction in Connecticut and Pennsylvania. He served as superintendent of construction and as engineer of many important railroads in the Middle West and from 1918 was vice-president of the Norfolk and Western Railroad. He was chairman of commissions representing the Southern group of railways on Federal valuation, in 1913. He was an authority in the ventilation of railway tunnels and on the testing of materials. He was a frequent contributor of technical articles to engineering publications and was a member of several scientific societies.

CHURCHILL, WINSTON (1871-). An American author (see VOL. V). His most recent works include: *A Far Country* (1915); *The Duelling Place of Light* (1917); *A Traveller in War-Time, with an Essay on the American Contribution to the Democratic Idea* (1918); *Dr Jonathan*, three-act play, (1919); and *The Crisis* (1921).

CHURCHILL, RT. HON. WINSTON LEONARD SPENCER (1874-). An English statesman (see VOL. V). At the outbreak of the War he was First Lord of the Admiralty but was forced to resign in 1915, and was then appointed Chancellor of the Duchy of Lancaster. He entered the army in 1916 and went to France as major in the Grenadier Guards, but retired in the same year. In 1917-18, he was Minister of Munitions. He was blamed for the Dardanelles disaster of 1917, but nevertheless was appointed Secretary of State for War and for Air in 1918. He held this office until 1921, when he became Secretary of State for the Colonies. In 1914, he was Rector of Aberdeen University.

CILICIA. This region in southeastern Asia Minor was the centre, after the War, of Armenian nationalistic aspirations and later of French imperialistic schemes. It was occupied by the British-French forces in their triumphant march north in 1918; its control fell to the French in 1919 in accordance with the terms of the secret Sykes-Picot agreement of May, 1916. The later discredited Sèvres Treaty of 1920 put the stamp of approval on the occupation by assigning a portion of Cilicia to the French mandate territory of Syria. A secret treaty, signed at the same time by France, Great Britain, and Italy, protected France in her rights in the rest of the territory by means of a zone of influence. Armenians flocked there in the hope of gaining asylum as well as possible French support in operations against the Turkish Nationalists who late in 1920 were moving against their compatriots in the East. The French policy had veered about, however. Rather than manifest an interest in Armenians, the French bent all their energies to conciliating the Turks. Armenians, who complained bitterly of Turkish massacres in the Taurus, were informed by French officials that they must either accept Turkish rule or be prepared to quit the country. The Turks, strangely enough, were unyielding, and French attempts at the pacification of Cilicia were stubbornly resisted in 1920-21. The policy proved wasteful and ill-advised, and from March, 1921, the

French tried to withdraw as gracefully as they might. In that month, Briand met with a Turkish Nationalist at London to effect an understanding, but the French concessions were not deemed adequate by the Turkish National Assembly. Finally, on Oct. 20, 1921, France and the Angora government signed a treaty which provided for the evacuation of Cilicia (See *TURKEY*.) A subsequent agreement provided for the protection of the Christian populations, the postponement of military conscriptions, and the creation of a Franco-Turkish commission with Cilician representation for the safeguarding of property. By Great Britain the step was regarded with hostility, for it meant a further repudiation of the Entente as well as the endangering of British interests in the Near East. The boundary between Syria and Turkey, as fixed by the treaty of Oct. 20, 1921, was written into the Treaty of Lausanne of July 24, 1923. Cilicia thus once more reverted to Turkey.

CINCINNATI. The second city of Ohio. The population increased from 384,745 in 1910 to 401,247 in 1920, and to 406,312, by estimate of the Bureau of the Census, in 1923. A new home rule charter was adopted in 1918 by popular vote and the ballot thereafter was shortened, as the city treasurer and city solicitor were to be appointed by the mayor instead of being elected by the public. A city planning commission was created and given extensive powers, and a zoning ordinance was enacted in 1924. A rapid transit system was under construction, a portion of which utilized the right of way of the abandoned Miami and Erie Canal, which was turned over by the State to the city for the purpose. Eleven miles of the system, which was to be 16½ miles long, were finished in 1923. The completed work was to include 2.45 miles of subway, 9 miles of open track-
age, 0.2 miles of tunnel, 3.4 miles of concrete trestle, and 1.4 miles of concrete elevated structure. A double deck terminal for interurban electric cars was finished the same year at a total cost of approximately \$11,000,000. The work of locking and damming the Ohio River with a view to establishing a 9-foot stage the year round was practically completed in 1924 and was expected to prove of especial benefit to Cincinnati in the shipment of coal from the Kentucky, Tennessee, and West Virginia fields. As a result of the War the city became a most important machine tool and metal working centre. See *CINCINNATI, UNIVERSITY OF*.

CINCINNATI, UNIVERSITY OF. A coeducational municipal institution at Cincinnati, Ohio, founded in 1871. The student body increased more than 150 per cent, from 1866 in 1914 to 4756 in 1924 and 323 in the summer of 1923; the faculty from 186 to 323 members; and the library from 96,000 bound volumes and 79,000 pamphlets, to 129,371 volumes. The productive funds rose from \$1,500,000 to \$4,291,244, and the income from \$299,000 to \$1,068,933. The College of Commerce was fused with the College of Engineering, which was known thereafter as the College of Engineering and Commerce; the Cincinnati Hospital Training School for Nurses became a department in the College of Medicine in 1916; the Cincinnati Law School became the College of Law of the university in 1918; the School of Household Arts, organized in 1914, was made the department of home economics in the College of Education; a new department

of hygiene and physical education was organized in 1916; and a department of leather research and a professorship of surgical anatomy were created in 1921. In 1922 the School of Applied Arts was opened under the direction of the dean of the College of Engineering and Commerce. A chemistry building and a women's building were completed in 1916 and a dormitory for men in 1923; the Alphonso Taft College of Law building was under construction at a cost of \$250,000 in 1924; the Tanners' Council of America was building a \$100,000 research laboratory in connection with the College of Engineering and Commerce. Francis Baldwin gave the university \$600,000 in 1916 and the Carnegie Corporation and the Rockefeller Foundation \$200,000 each in 1920; the Graduate School and classical department received a gift of \$275,000 in 1923. Frederick Charles Hicks succeeded Charles William Dabney, Ph.D., LL.D., as president in 1920.

CITY PLANNING. Although the War brought city planning and replanning projects in Europe to a sudden stop and put a gradual stoppage to such work in the United States and Canada, yet in the long run it did much to stimulate such planning in all the warring countries. This arose, first of all, through the planning of industrial war towns, either new ones or additions to old settlements, which, under various new social stimuli, made use of the new art of city and town planning to increase the amenities of urban industrial life. The reconstruction of devastated areas in Europe also gave rise to much careful city planning for immediate or early execution. In the United States there was much planning despite the War, especially before America joined the Allies. In addition to all this, 1915 and 1916 saw the beginning in the United States of the great city zoning movement which gained impetus by 1920 and has since swept over the country. The fact that zoning requires no construction outlay and comparatively little operating expense and that it prepares the way for the more orderly, more economical and more efficient construction of several kinds of municipal works facilitated zoning at a time when many other municipal activities were almost at a standstill. Although not known by that name at the time, zoning in America was begun as early as 1904 by Boston, following State enabling legislation of 1898 and 1904 which empowered Boston to limit the height of building near the public library on Copley Square. In 1909, Los Angeles instituted zoning in a limited way. In 1915 zoning was adopted by Neenah, Wis. What gave it its real start in America was the exhaustive study of the subject made in New York City, followed by the adoption of a remarkably complete zoning ordinance in 1916, under a State enabling act passed two years earlier. A second city adopted zoning in 1916 and three States in 1917. Eight joined the ranks in 1918, 14 in 1919, 28 in 1921, 79 in 1922, and 81 in 1923. On Jan. 1, 1924, zoning had been adopted by 221 American cities in 27 States; 35 States and the District of

Columbia had authorized zoning, and in two States zoning had been adopted, by one city in each case, without State authorization.

The distribution of the 221 zoned municipalities and the character of the zoning are shown by the table on page 303 made up for use here from a list of zoned cities compiled by the Division of Building and Housing of the United States Department of Commerce. The original list cites the dates and character of the zoning enabling acts passed by 35 of the 48 States of the Union, some giving broad powers to all municipalities and others restricting the scope of the work and the cities permitted to undertake it. Zoning is effected by a city ordinance. When comprehensive it prescribes the percentage of the area of lots which may be covered with buildings or sets a minimum limit on the depths of front and rear and the widths of side lots; the heights to which buildings may be carried, either specifically or in relation to street widths, but generally with provisions for towers and for carrying other limited parts of a building above the main cornice line by means of one or more setbacks; and the classes of buildings that may be erected, as, for instance, residence, business or industrial. Generally there are two or more subdivisions in each main class. For instance, there may be single-family, two-family, and apartment-house residence districts, or even many more subdivisions in this class. The *Chicago* zoning ordinance, adopted by the unanimous vote of the city council on Apr. 5, 1923, provides for four classes of use and five classes of volume districts, with control by the city building commissioner. According to approved practice, there is a board of appeals. The ordinance was framed by a commission of 22 city officials, business men, engineers and architects. The use districts are private residence, apartment, commercial, and manufacturing. The volume districts are for the regulation of heights of buildings and percentage of lots built on and are thus combinations of the more usual height and area districts. The volume classification for private residences, two-story flats, and similar buildings is 33 feet to the roof line, and a considerable allowance for yard space; for three-story apartments, 66 feet; taller apartment houses, 132 feet; warehouse and office buildings, near the central district, 198 feet; downtown, 264 feet. These heights may be exceeded at certain distances back from the cornice and by spires and other projections.

Constitutionality of Zoning. The legal basis of zoning is the police power. Reliance should not be placed on the general grant of police powers by the State to the city but rather in specific State zoning legislation, preferably but not necessarily applicable to all the municipalities of the State. Since there was no such thing as zoning when many of the State constitutions were adopted, it has been considered necessary or advisable to secure constitutional amendments authorizing zoning in some States. A considerable body of court decisions in support of zoning has been built up; some of these have emanated from the United States Supreme Court. Broadly, the power to authorize zoning rests with each State legislature, subject only to inhibitions, generally implied if construed as existing. A standard or model State zoning enabling act was drawn in 1922 and revised as of Jan. 1, 1923, by a com-

mittee of experts appointed by Secretary of Commerce Hoover; this was obtainable from the United States Department of Commerce. Acts modeled wholly or partly on this standard had been passed by 11 States and were being considered by the Legislatures of four others early in 1924.

State court decisions up to 1924 were in some cases strongly adverse to zoning and in others equally strong in support of its legality under the State constitution. Thus in 1923 there were two adverse decisions in the *New Jersey* Supreme Court and one in the *Missouri* Supreme Court, while the *Louisiana* and *Wisconsin* courts upheld local zoning ordinances. The two adverse decisions in New Jersey were limited in application compared with those in the three other States and are subject to appeal. The Missouri decision, in the highest State court, was sweepingly against zoning as outside the police power and confiscatory, while the Louisiana and Wisconsin decisions, also in the highest State courts, were as unconditionally sweeping in the opposite direction. The New Jersey decisions were still under appeal in May, 1924. The Missouri decision, four to three, held that the St. Louis zoning ordinance "provides for the taking of property for a public use without compensation and without a judicial hearing," is outside the police power, and would result in "confiscation pure and simple." The *New Orleans* zoning ordinance, sustained by the Louisiana Supreme Court in reversal of a lower court, rests on this authorization of zoning in the Louisiana constitution of 1921: "All municipalities are authorized to zone their territory to create residential, commercial and industrial districts and to prohibit the establishment of places of business in residential districts." The court held that the New Orleans ordinance "is a valid exercise of the police power" and not in violation of the Federal constitution. The Louisiana court even went so far as to declare that aesthetic considerations, as affecting "the comfort and happiness of the residents" of a district and sustaining "in a general way the value of property in a neighborhood," may be protected by a zoning ordinance. It also said: "An eyesore in a neighborhood of residences might be as much of a public nuisance, and as ruinous to property values in the neighborhood generally, as a disagreeable noise, odor, or menace to safety or health."

In the *Milwaukee* decision, given by the State Supreme Court of Wisconsin on Dec. 11, 1923, the court said in part:

"If in the prosecution of governmental functions it becomes necessary to take private property, compensation must be made, but incidental damage to property resulting from governmental activities or laws passed in the promotion of the public welfare is not considered a taking of the property for which compensation must be made."

"This is no new idea, although it has but recently taken the form of legislation. Every one who has observed the haphazard development of cities, the deterioration in the desirability of certain residential sections by the encroachment of business and industrial establishments on and into such sections, resulting in the consequent destruction of property values and in the ultimate abandonment of such sections for residential purposes, has appreciated the desirability of regulating the growth and development of our urban communities."

"Fresh air and sunshine add to the happiness of the home and have a direct effect on the well being of the occupants. It cannot be denied that a city systematically developed offers greater attractiveness to the house seeker than a city developed in a haphazard way. The one compares to the other as a well ordered department store compares to a junk shop."

By a unanimous decision of the Kansas State Supreme Court in a *Wichita* case, the validity of excluding a commercial building from a residence district was established. Included in the decision were these sentences: "There is an æsthetic and cultural side of municipal development which may be fostered within reasonable limitations. Such legislation is merely a liberalized application of the general welfare purposes of the State and Federal constitutions." (See *National Municipal Review*, June 1923, for synopsis of case and decision.)

The Missouri decision is not locally construed as wholly invalidating the St. Louis zoning ordinance. The City Counsellor of St. Louis having ruled that the height regulations were still in force, an ordinance was approved by the mayor on Mar. 11, 1924, repealing the old height limits, which varied from 150 feet in the business districts to 45 feet in outlying sections, with 10 per cent additional in some cases, and providing that buildings in any part of the city may be carried to a height equal to two and a half times the width of the street, buildings of first class construction to go as high as 206 feet, and if fronting on these streets, to 250 feet. This opens residence districts to high houses and makes additional high buildings possible in the downtown district.

In both the United States and Canada, city planning is controlled by the several States and provinces, and activities of the general government in that field are confined to advice, research and the collection and dissemination of information. State activities in America have been confined to legislation, except that up to May, 1923, State departments or divisions of city planning had been created in Massachusetts, New York, Pennsylvania and California. In 1917, Canada, through its Department of Conservation and Development, engaged as town planning adviser Thomas Adams, who had been an inspector of the British Local Government Board since the passage of the Housing and Town Planning Act of 1909. In 1917 also the commission just named put out a model town planning act for the benefit of such of the provincial Legislatures as might wish to pass acts dealing with the subject.

In 1919, the British Town Planning Act of 1909 was amended. An important change was a clause making town planning compulsory instead of permissive, the compulsory feature going into effect Jan. 1, 1923, in all places which by the Census of 1921 had a population of 20,000 or more. By Jan. 21, 1926, these places must submit town planning schemes to the Ministry of Health, successor of the Local Government Board. France passed its first general city planning law in 1919. This is somewhat broader than the British act of the same year. Within three years of its promulgation, the French act provided that planning schemes must be in force in every city of 10,000 population or over, all communities in the Department of the Seine, all places of 5000 to 10,000 population that show a growth of more than 10 per cent between two successive quinquennial censuses, and settlements, regardless of size, having a picturesque, artistic or historic character. (See *The New International Year Book*, 1919, for further details.)

Regional planning received increasing attention since papers on the subject were presented

to the National Conference on City Planning at its meeting in 1919 (see *Proceedings of the Conference*). Up to 1924 the subject had not gone beyond the study and report stage. By far the most notable undertaking of this kind, under the name, "Plan of New York and Its Environs," was begun early in 1921 and first publicly announced in May, 1922, at a largely attended meeting of engineers, architects, city planners, publicists, and civic workers held in New York City at the call of the Russell Sage Foundation, the chief backer of the project. The plan included the entire metropolitan district of New York and New Jersey and all of Long Island and took in territory as far as Bridgeport, Conn.; West Point, N. Y.; Princeton, N. J., and a large part of the New Jersey seacoast. The regional survey embraces some 5528 square miles with a resident population of some 9,000,000, living in nearly 400 communities. The work was in charge of a committee having Frederic A. Delano as chairman, with Thomas Adams as general director of plans and surveys. The detail into which it was going is illustrated by a 50-page report issued by the committee early in 1924, on *The Chemical Industry in New York and Its Environs; Present Trends and Probable Future Developments*, the first of a series of economic monographs.

Los Angeles Regional Planning Conferences were held in 1922 and 1923. The Committee on Municipal and Metropolitan Affairs of the Boston Chamber of Commerce made a report in 1922 on *Metropolitan Planning and Development in Boston and Its Environs*. In 1923 was formed within the Metropolitan District Commission of Massachusetts a Division of Metropolitan Planning to investigate the transportation service and its coordination with roads, bridges, waterways, railroads, street railways, and other arteries of traffic. In January, 1924, a Minneapolis-St. Paul Metropolitan Planning Committee was organized to serve an area of 25-mile radius. This movement had been started by the Northwestern Section of the American Society of Civil Engineers. During 1923 the Regional Planning Association of America was formed, with Clarence S. Stein of New York City as secretary.

Construction work to carry out city replanning improvements included large expenditures at Chicago for various purposes and considerable outlays on major street plans or important street widenings and extensions at St. Louis, Detroit, Philadelphia, Boston, and elsewhere; civic centre groups at Cleveland, Denver, San Francisco, and smaller places, and the two municipal buildings and the tower between them at Springfield, Mass. A pamphlet review of *Progress in the Chicago City Plan during the Ten Years 1909-19* showed that in that period 12 major street improvements had been put under way at a total cost of \$230,000,000, of which \$61,500,000 had been raised by bonds voted by the people and \$162,000,000 fell on various railway companies. Besides these improvements, much was done and much more was projected to improve city transit facilities, and attention was given to the relief of street traffic congestion by automobiles, parking, etc. (See articles by Herbert S. Swan in *Engineering News-Record*, Feb. 22, and Mar. 1, 1923, on *Automobile Traffic, City Planning and Traffic Regulations and Speeding Up Traffic at Street*

Intersections, each accompanied by diagrams and tables.)

Bibliography. Among the many books on city planning and allied subjects published since 1913 are Koester, *Modern City Planning and Maintenance* (New York); Nolen, *City Planning* (New York); Lewis, *The Planning of the Modern City*, followed by new edition in 1922 (New York); Adams *Rural Planning and Development* (Ottawa, Canada); *Garden Cities and Back to the Land* (London); Moore, *Daniel Burnham, Planner of Cities* (Boston); Williams, *The Law of City Planning and Zoning* (New York), on world-wide legislation and American court decisions; Kimball, *Manual of Information on City Planning and Zoning* (Cambridge, Mass.); Hughes and Lanborn, *Towns and Town Planning, Ancient and Modern* (London); Adshead, *Town Planning and Town Development* (London). Consult also annual reports of *National City Planning Conference* (New York) and *Town Planning Review*, a British quarterly.

CIVIC FEDERATION, NATIONAL. Seth

and the growth of welfare work during the past thirty years, and uniformity of legislation and court procedure. Seth Low, president, who died during the year, was succeeded by V Everit Macy. In 1917 the annual meeting was held in New York City in January. The programme covered regulation of industrial corporations, compulsory health insurance, infringement of personal liberty, health of United States troops at the Mexican border, parallelism between settlement of international and industrial disputes, woman labor, and war problems. During the year, the Federation planned and undertook a great campaign for cooperation between employers and employees to help win the war. The convention of 1918 was also held in New York City. The main subject discussed was the programme of the British labor party. The Federation was active during the year in securing compensation for enlisted men, industrial training for the war emergency, proper housing for war workers, etc. During 1919 the Federation was especially active in spreading propaganda against Bolshevism through its official organ, *The National*

142 comprehensive, i. e. use, height and area.

209 cover use, alone or in combination

146 cover height, alone or in combination.

Low was president of the organization in 1915. The Industrial Economics Department made a survey of the social and industrial changes which had taken place in the United States during the preceding generation. The annual meeting for 1916 was held at Washington in January. One session was devoted to the discussion of preparedness for national defense. Among other subjects considered were workmen's compensation, pensions for public and industrial employees, immigration, changes in labor conditions

Civic Federation Review. A commission was sent to England, France, and Italy for the purpose of studying industrial conditions in those countries. The report of this commission was made in September. In 1919, President Macy was forced to retire because of ill health, and Alton B. Parker was elected president. The campaign against Bolshevism continued in 1920. The Federation's foreign commission reported on social insurance. A second report on profit sharing was issued. International peace and

the League of Nations were considered. In this year the annual meeting of the Federation was held in New York City. Among the subjects discussed were increased production through industrial training, arbitration, conciliation, and collective bargaining, and revolutionary forces in the United States. In 1921 the national industrial commission of the Federation made a special study of questions affecting the three great divisions of society: capital, labor, and the general public. The annual meeting was held in New York City. The chief subjects discussed were problems confronting the railroads, trust regulation, free speech, academic freedom, chemical warfare, and the Russian situation. In 1922 the department on revolutionary movements made an interesting inquiry into the extent to which revolutionary forces had penetrated the church, the college, the press, women's clubs, trade unions, etc.; issued a symposium on Wells' *Outline of History*, and took up the "Youth" movement. A national committee on foreign relations was organized, with the function of educating the people of the country in foreign relations. In April, 1923, the annual meeting, held in New York City, took up the demand for the release of I. W. W. war prisoners, conditions in Soviet Russia, pacifist opposition to patriotic movements, and the citizen's duty to participate in party politics. In 1924, the annual meeting was held in New York City, April 23-24. The department on current economic and political movements reported on industrial, social, and civic progress in the past fifty years. The discussion embraced the new economic policy of the American Federation of Labor, Soviet Russia, pacifism and militarism, and practical politics. A very active women's department is connected with the Federation.

CIVIL SERVICE REFORM LEAGUE.

An organization founded in 1881, to establish and promote the merit system of appointment, promotion and removal in the civil service throughout the United States. Throughout the decade 1914-1924 the League was active in investigating conditions in the government, in protesting against violations of the law and urging the extension of the merit system. As a result of its findings on the sources of inefficiency in government departments during the War, President Wilson reorganized the Civil Service Commission in 1919. Clauses inimical to the civil service reform were struck out from the National Defense Bill, the Shipping and Defense Bills of 1916, and the 1920 Census Bill, though the Rural Credits Bill and the Volstead Bill were enacted without changes suggested by the League. A bill sponsored by the League which provided for the reorganization of the Foreign Service was enacted. The League conducted a successful campaign in Colorado in cooperation with the local committee, for a civil service amendment to the constitution and helped in securing civil service charters in several important cities. Under the Harding administration it protested the dismissal of the director and 30 employees of the Bureau of Engraving and Printing and the dismissal of A. P. Davis from the post of Commissioner of Reclamation. The programme of the League demanded the reclassification of the postal service; the inclusion of the prohibition enforcement bureau in the classified service and the elimination of provisions permitting appoint-

ment of "special experts" without examination. Richard Henry Dana was President of the League from 1913 to 1923. The officers in 1924 were: President, William Dudley Foulke, Secretary, Harry W. Marsh; Treasurer, A. S. Frisell. Headquarters were maintained at 8 West 40th Street, New York City.

CLAIR, MATTHEW WESLEY (1865-). An American bishop, born at Union, W. Va., and educated at Morgan College, Baltimore. He was ordained to the ministry of the Methodist Episcopal Church in 1889, and held various charges in West Virginia and in the District of Columbia until 1919, when he became district superintendent in Washington. In 1920, he was made bishop of Monrovia, Liberia.

CLAIRE, INA (FAGAN) (1892-). An actress and vocalist born at Washington, D. C. who opened her career by impersonations of Harry Lauder in vaudeville entertainment in 1907. She has spent her time between plays and vaudeville and is best known for her talent of mimicry. Some of her best parts included Polly Shannon in *Polly with a Past* (1917); Jerry Lamar in *The Gold Diggers* (1919); and the wife in *Bluebeard's Eighth Wife*.

CLAPP, CHARLES HORACE (1883-). An American geologist, born at Boston, Mass. He was graduated in 1905 at the Massachusetts Institute of Technology, where in 1910 he received the Ph.D. degree. In 1905, he became instructor of geology at the University of North Dakota, and at the same time, assistant geologist of the State Survey. Two years later he returned to the Institute of Technology. During 1908-15, he was geologist on the Geological Survey of Canada, and then for three years was professor of geology at the University of Arizona. He was called in 1916 to the chair of geology at the Montana School of Mines; in 1918, became president of the School of Mines and in 1921, became president of the University of Montana. He has also been director of the Montana Bureau of Mines since 1919, and assistant geologist of the United States Geological Survey since 1914. His original investigations have to do with petrology and economic geology, on which subjects he has published many papers and reports.

CLAPP, EDWIN JONES (1881-). An American economist, born at Hudson, Wis., and educated at Yale University and at the University of Berlin, Germany. During the period 1910-12, he taught economics at Yale and at New York University. From 1912 to 1914, he was special traffic commissioner of the Directors of the Port of Boston. From 1914 to 1920, he was professor of economics in New York University, and afterwards was privately engaged in the study of economic problems. He wrote: *The Navigable Rhine* (1911); *The Port of Hamburg* (1911); *Economic Aspects of the War* (1915); *The Port of Boston* (1916); *Railway Traffic* (1917); *The Port of Charleston* (1921); *The Port of Baltimore* (1921).

CLARK, BARRETT HARPER (1890-). An author and editor born in Toronto. He is best known for his many books on the theatre, including *The Continental Drama of To-day* (1914); *British and American Drama of To-day* (1915); *Contemporary French Dramatists* (1915), and *How to Produce Amateur Plays* (1917). He was editor of *The World's Best Plays* series, 50 vols. (1913-18); four titles in the Drama League's series (1914-18); Walter

Prichard Eaton's *Plays and Players* (1916), and *Representative One-act Plays by British and Irish Authors* (1921). He is co-author of *The Rivet in Grandfather's Neck* (1921) and edited and translated many foreign plays. He was dramatic director of Camp Humphreys.

CLARK, CHAMP (1850-1921). An American politician (see VOL. V). From 1919 until his death, he was Democratic minority leader in the United States House of Representatives, having been Speaker in the House previous to that date. He was defeated in the election of 1920. He died in Washington, D. C., on Mar. 2, 1921.

CLARK, CLARENCE DON (1851-). An American senator (see VOL. V). He was appointed member of the International Joint Commission in 1919.

CLARK, GEORGE LUTHER (1877-). An American lawyer, born at Waynesville, Ohio. He graduated from Kenyon College in 1896, and studied law at Indiana University and at Harvard. From 1902 to 1904, he was instructor in law at Leland Stanford Jr. University, and from 1904 to 1909 was professor of law at the University of Illinois. He held the same position at the University of Michigan from 1909 to 1912, and in the University of Missouri from 1913 to 1921. He is author of *Equitable Servitudes* (1917); *Equity* (1919); and *Selected Cases on Equity* (1921).

CLARK, JAMES TRUMAN (1852-). An American railway official, born in Albany, N. Y. He was educated in the public schools of that city, and began his railway service as messenger boy with the New York Central Railroad in 1870. In 1873, he joined the Chicago and Northwestern Railroad and was rapidly promoted to important positions with that line, becoming vice president in charge of traffic in 1899. From 1916, he was president of the C. St. P. M. & O. Railway.

CLARK, JOHN MURRAY (1860-). A Canadian lawyer and scholar. He was educated at the University of Toronto. At one time he was president of the Royal Canadian Institute, the most important learned society of the Dominion. He was appointed by the government to codify the mining laws of Canada. Among his publications are: *The Law of Mines in Canada*; *Company Law*; *International Arbitration*; *The Future of Canada*; *Proportional Representation*; *Thermotics*; *Canada and the Navy*; *The Reign of Law*; *Canada's Gold and War Finance*; *Disallowance*; *The Virginia Experiment*; and *Canada and Virginia*, and others.

CLARK, LEON PIERCE (1870-). An American neurologist and psychiatrist, one of the world's leading authorities on epilepsy. Born at Ingheside, N. Y., he received his medical degree from New York University in 1892 and at once began his career as resident physician of the Craig Colony for Epileptics. After serving many years in this capacity, he settled in New York as a neurologist. In connection with the treatment of epilepsy he has of late years advocated psychotherapeutic measures as valuable and has made converts to this view in this country and Great Britain. He has written assiduously on the subject of epilepsy for nearly 30 years and has (1924) an exhaustive treatise on this disease nearly ready for publication.

CLARKE, SIR EDWARD GEORGE (1841-).

An English lawyer (see VOL. V). He retired from the bar in 1914. His recent works include: *The Book of Psalms: the Prayer Book Version Corrected* (1915); *The National Church* (1916); and *The Story of My Life* (1918).

CLARKE, JOHN HESSIN (1857-). An American jurist, born at Lisbon, Ohio. He graduated from Western Reserve University in 1877, and in the following year was admitted to the Ohio bar. From 1878 to 1880, he practiced at Lisbon, and from 1880 at Youngstown. He moved to Cleveland in 1897 where he remained until 1914. For many years he was general counsel of the New York Central and St. Louis Railroads. He served as United States district judge for the Northern District of Ohio from 1914 to 1916, and in the latter year was appointed associate justice of the Supreme Court of the United States. He resigned in 1923 in order to devote all his time to the interests of the League of Nations, of which he was an ardent supporter.

CLARKE, JOHN MASON (1857-1925). An American geologist and palaeontologist (see VOL. V). He was president of the Geological Society of America in 1916-17 and chairman of the Geological Committee of the National Research Council in 1917. The Permanent Wild Life Protection Fund awarded him a gold medal in 1920.

CLARKSON COLLEGE OF TECHNOLOGY.

A college for men founded in 1896 at Potsdam, N. Y. The number of students increased from 104 in 1914 to 251 in 1924, and the number of faculty members from 10 to 18. In 1924 the total endowment amounted to more than \$1,000,000, and the productive funds to \$500,000, with \$150,000 more pledged. Between its foundation and 1923 the institution granted 403 degrees. President, John P. Brooks, Sc.D.

CLARK UNIVERSITY. A nonsectarian institution for graduate studies at Worcester, Mass., founded in 1889. The enrollment of graduate students in 1923-24 was 55, and of special students, 44, as compared with 94 graduate students in 1914. During the same period the number of members of the faculty was increased from 21 to 35, and the library was increased from 60,000 to 104,000 volumes. The productive funds of the university were increased from \$2,400,000 to \$4,693,032. A graduate school of geography was established in 1921, and a department of geology was added to the university in 1922. Special emphasis was given in 1923 and 1924 to studies in history, international relations, economics, and geography. President, Wallace W. Atwood, Ph.D.

CLASSICAL PHILOLOGY. See **PHILOLOGY, CLASSICAL.**
